Returns.—Each House has the power of selecting returns from all those public departments which are connected with the revenue, under control of the Treasury, or regulated by statute; but returns of matters connected with the exercise of royal prerogative, as from public departments subject to her Majesty's secretaries of state, are obtained by means of addresses to the crown. A return is not allowed to be ordered in one House regarding the proceedings of the other; when such return is wanted, it is usual to make an arrangement by which it is moved in the House to whose proceedings it relates, and after it has been presented, a message is sent to request that it may be communicated. Returns cannot be moved from private associations, or persons not exercising public functions; and the papers and correspondence sought from government departments must be of an official, not a private or confidential description. This rule was, under special circumstances, departed from in 1863, in regard to the opinion of the law-officers of the crown in the case of the *Ceylon*. Accounts and papers presented are ordered to lie on the table, and when necessary, ordered to be printed, or in the Commons referred to the Printing Committee appointed at the beginning of each session.

Election Committee.—The trial of election petitions is one of the duties of the House of Commons. Until 1770 all questions regarding contested elections were decided by the whole House; the *Devereille Act* of that year introduced the practice of appointing committees for their trial. The Act 11 and 12 Vict. c. 88, now regulates the trial of contested elections. An election petition is defined to be a complaint, either (1) of an undue election; (2) that no return has been made according to the requisition of the writ; or (3) of the special matters contained in the return. It must be signed by some person who voted, or had a right to vote at the election, or by some person who claims to be returned, or alleges himself to have been a candidate. The petition must be lodged within fourteen days after the return objected to. Recognisance must be entered into, according to a form prescribed, by sureties to the extent of £1000, in petitions not less than £250 for each individual—this petitioner having it in his option to pay the money, or part of it, into the bank instead of finding security. Six members selected from those who are not themselves parties in contested elections, are appointed at the beginning of every session by the Speaker's warrant as the 'General Committee of Elections.' To this committee all election petitions are referred; and it is their duty to choose the select committee which is to try each petition. From a list of the members of the House, who are not excused or disqualified from sitting on

election committees, they select six, eight, ten, or twelve members who are called the chairmen's panel, and are liable throughout the session to serve as chairmen of select committees, but are exempted from serving on select committees in any other capacity. The remaining members on the list are then divided into five panels, which being ranged in order by lot, are to take their turn successively in furnishing members for election committees. Each select committee consists of four members, chosen by the general committee from the panel in service, and a chairman appointed by the chairmen's panel. The members are sworn at the table by the clerk, 'well and truly to try the matter of the petition, and a true judgment to give, according to the evidence.' Evidence may be taken on oath, and it is enacted by the Corrupt Practices Act, 1863, that no witness is excused from answering a question on the ground that his answer may criminate himself; but a witness, making an answer which tends to criminate him, may demand a certificate which shall be a protection to him from prosecution for such answer. The decision lies with the majority of the committee, the chairman having both a deliberative and a casting vote. The committee are required to determine whether the sitting member, or any other person, be duly returned, or whether the election be void, or whether a new writ ought to issue; and their determination is final, and is carried into execution by the House. They may also make a special report on some other point, which is not final. The most frequent subjects of special reports are bribery, treating, and the use of undue influence, matters regarding which various acts have been passed, the most important being 17 and 18 Vict. c. 102 (1854), 21 and 22 Vict. c. 87 (1858), and 26 Vict. c. 29 (1863), three statutes known as the 'Corrupt Practices Prevention Acts.' It was formerly required to prove agency, before evidence was allowed to be given of the facts on which a charge of bribery rested, but Act 4 and 5 Vict. c. 57, dispensed with this necessity. By the Corrupt Practices Prevention Act, 1863, when an election petition complains of bribery, treating, or undue influence, the committee is required to report whether they had been extensively practised. The candidate declared by an election committee guilty of bribery, treating, or undue influence by himself or his agents, is declared by the Corrupt Practices Act, 1854, to be incapable of representing the same constituency in the then existing parliament. The new law of evidence affords further facilities for the detection of bribery, in so far as it allows the personal examination of the sitting members and candidates.

By the Act of 1854, the offering of money, office, employment, &c., to a voter to induce him to vote or abstain from voting, or the offering of a similar consideration to any person to induce him to procure the return of a candidate or the vote of an elector, the acceptance of such consideration, and the payment of money in the knowledge that it is to be expended in bribery, or the repayment of money which has been spent in bribery, are all declared to be acts of bribery punishable by fine and imprisonment, as well as by the forfeiture of £100 with costs to any person who will sue for the same. Any voter who agrees to receive money, office, or employment for voting or abstaining from voting, and any person who, after an election, receives money or other consideration on account of any person having voted or refrained from voting, is also guilty of bribery, and liable to forfeit £10 with costs to any one who will sue for the same. *Treating*, which is defined as the providing of meat, drink, or other entertainment to any person

in order to be elected, or in consideration for any person voting or abstaining from voting, involves a penalty of £50 similarly recoverable, as also does *undue influence*, or interference by intimidation, abduction, or otherwise, with the freedom of electors. Persons guilty of any of these offences are, by the provisions of the same acts, to be struck off the register, and their names inserted in a separate 'list of persons disqualified for bribery, treatment, and undue influence,' which is to be appended to the register of voters. Cockades are prohibited, as is the furnishing of refreshment on the day of election to a voter in consideration of his being about to vote. By the Corrupt Practices Act, 1854, it is however declared lawful to provide a conveyance for a voter, though not to pay him a sum of money for travelling expenses. By the Act of 1863, no payment is allowed to be made on behalf of a candidate except through his authorised agent, and all claims against a candidate in respect of an election must be settled within a month, otherwise the right to recover them is barred. A detailed account of election expenses with vouchers is required to be delivered within two months of the election to the returning officers, by whom it is published in a local newspaper, and the vouchers are to be open for a month to the inspection of voters.

Act 15 and 16 Vict. c. 57 enacts that upon the joint address of both Houses of Parliament representing to her Majesty that a committee of the House of Commons has reported that corrupt practices have prevailed extensively at any election, her Majesty may appoint commissioners to make inquiry. The Corrupt Practices Prevention Act, 1863, provides that when an election committee has reported that certain persons named have been guilty of bribery or treating, and their report is confirmed by a commission of inquiry, such report, with the evidence taken by the commission, is to be laid before the attorney-general with the view of instituting a prosecution.

Impeachment.—In the reign of Henry VIII. an act of attainder was the usual mode of proceeding against state offences. A bill of attainder sometimes followed a regular trial and conviction, as in the case of Empson and Dudley, but was sometimes passed without trial, examination of witnesses, or hearing the accused party, as in the attainder of Fisher and Sir Thomas More. The practice of impeachment of extraordinary offenders before the Lords by the Commons, which had been frequent during the 14th and 15th centuries, was revived in the reign of James I. This proceeding is not like bills of attainder or pains and penalties, the making of a new law *pro re nata*, but a carrying out of the already known and established law. The great representative inquest of the nation first find the crime, and then as prosecutors support the charge before the highest court of criminal jurisdiction. It has always been allowed that a peer may be impeached for any crime whether cognizable by the ordinary courts or not. The right of the Commons to impeach a commoner of a capital offence, which was at one time doubted, has been solemnly affirmed by the House of Lords. The trial is conducted by managers for the Commons. Witnesses are summoned by the Lords at the desire of the Commons, and Westminster Hall has usually been the place of trial, the Lord High Steward presiding. The managers make their charges and adduce evidence; the accused answers, and may defend himself by counsel; and the managers have a right to reply. In giving judgment, the question is put by the Lord High Steward to each peer, beginning with the junior baron, on each article separately, whether the accused be guilty. The

obtaining a reform of certain abuses, and a more liberal political constitution, similar to what Tuscany had (February 1848) obtained from its grand-duke, he threw himself into the arms of Austria, and consented to the occupation of his territory by Austrian troops. In March 1848 a revolution broke out, and the duke was compelled to grant the popular demands, but he almost immediately after retired from the country. P. joined with Sardinia in the war of 1848—1849 against Austria, but on the triumph of the latter power was compelled to receive Charles III. (his father, Charles II., having resigned his throne, March 1849) as its ruler. The new duke recalled the constitution which his father had been compelled to grant, and punished with great severity the active agents of the revolutionary movements in his dominions. His arbitrary measures were effectively seconded by his chief minister, an Englishman named Ward, who shared the public obloquy with his master. After Charles III.'s assassination in March 1854, his widow Louise-Marie-Thérèse de Bourbon, daughter of the last Duke of Berry (q. v.), assumed the government for the behoof of her son Robert I., and made some attempts at political reform; but owing to the excited state of the people they were little effective, and she and her son were compelled to leave the country in 1859, on the outbreak of a new war between Sardinia and Austria. In March 18th of the following year the country was annexed to Sardinia, and now forms a part of the Kingdom of Italy, constituting the two provinces of Parma (area 1251 English square miles, pop. 253,502) and Piacenza (area 965 English square miles, pop. 210,933), a few of the outlying districts, amounting to about 150 square miles, being incorporated with other provinces.—*Official Statistics of the Kingdom of Italy* (Turin, 1861); *Budget of the Emiliæ*; *Report of the Marquis Pepoli to the Minister of Finances* (Turin, 1860); *idem. Report of General Tozze to the Minister of War* (1863).

PARMA, the chief town of the province of the same name in Italy, and formerly the capital of the duchy of Parma, is situated on both sides of the river Parma, 12 miles south from the Po, 75 miles south-east from Milan, and about the same distance east-north-east from Genoa, with a population (1863) of 47,428.

The town is of a circular form, and is surrounded by walls and ditches flanked by bastions; the streets are straight and wide, and meet at right angles, the chief of them, a part of the Roman Via Æmilia, crossing the city from east to west, and dividing it into two nearly equal parts. P. is celebrated for its churches, 10 in number, the chief of which are the *Duomo*, or Cathedral (consecrated 1106 A.D.), built chiefly in the Lombard style, having the interior adorned with magnificent frescoes by Correggio, and paintings by other artists, and surmounted by a beautiful dome; the *Battisterio*, or Baptistery, one of the most splendid in Italy, begun in 1196 and completed in 1231; the church of the *Madonna della Steccata*, containing the famous painting of 'Moses breaking the Tables of the Law' by Parmigianino. The other celebrated buildings are, the Farnese Palace, a gloomy and ill-constructed edifice; the Farnese Theatre, built (1618—1628) of wood, and now in a most dilapidated condition. P. has also a library containing 140,000 volumes, mostly well selected, and many of them rare and valuable works; a museum of antiquities; a botanic garden; a theatre (*Teatro Nuovo*); an academy of fine arts, founded in 1752, possessing a collection of 600 pictures, many of which are exceedingly valuable. The pictures

most highly esteemed are the 'Madonnas' of Correggio and Francia, the 'St Jerome' of Correggio, and the 'Jesus Glorified' of Raphael.

The manufactures of P. are stockings, porcelain, sugar, wax-candles, and vessels of crystal, also silk, cotton, and fustian stuffs. The chief exports are cheese and silk goods; and in June there is an annual silk fair.

PARMA, BATTLES OF. An indecisive engagement took place here June 29, 1734, between the confederated armies of England, France, and Spain, and the Austrians; and on June 19, 1799, the French under Macdonald were routed by the Russians under Suwarof, with a loss of 10,000 men and 4 generals.

PARME'LIA, a genus of Lichens, with a leafy horizontal thallus which is lobed and cut; and orbicular shields (*apothecia*) fixed by a central point, concave, and bordered by the inflexed thallus. The species are numerous, and many are found in Britain. Some of them are occasionally employed in dyeing. Various chemical principles have been discovered in lichens of this genus, as *Usnic* or *Usnic Acid* (also found in species of the genus *Usnea*), and *Parietin*. Valuable medicinal properties—tonic and febrifugal—have been ascribed to *P. parietina*, the Common Yellow Wall Lichen, or Common Yellow Wall Moss of the herb shops, a bright yellow species with deep orange shields, plentiful on walls and trees in Britain and most parts of Europe.

PARMENIDÈS, a Greek philosopher of Elea, in Lower Italy, and in the opinion of the ancients the greatest member of the Eleatic school, flourished about the middle of the 5th c. B.C. Nothing is known with certainty regarding his life, but he is said to have visited Athens in his old age, and to have conversed with Socrates, then quite a youth. The story, though it rests on the authority of Plato, has a suspicious air, and seems as if it were intended to account for the influence which the philosophy of P. undoubtedly exercised on that of Socrates and Plato themselves. P., like Xenophanes of Colophon, sometimes regarded as the first of the Eleatics, expounded his philosophy in verse—his only work being a didactic poem *On Nature*. The leading design of this poem is to demonstrate the reality of Absolute Being, the non-existence of which P. declares to be inconceivable, but the nature of which, on the other hand, he admits to be equally inconceivable, inasmuch as it is dissociated from every limitation under which man thinks. P. is not a theologian in speculation, seeking rather to identify his 'Absolute Being' with 'Thought' than with a 'Deity.' Only fragments of his poem remain, which have been separately edited by Fülleborn (Zullichau, 1795); another collection is that by Brandis, in his *Commentationes Eleaticæ* (Altona, 1815); but the best is to be found in Karsten's *Philosophorum Græcorum veterum Reliquiæ* (Amstelod., 1835).

PARMIGIANO, GIROLAMO FRANCESCO MARIA MAZZOLA, called Parmigiano or Parmigianino, born at Parma in 1503, an able painter of the Lombard school, and the most distinguished of those who followed the style of Correggio. His pictures attracted much attention when he was little more than fourteen years of age. In 1523 he went to Rome to follow out his studies, and was soon favourably noticed and employed by Clement VII. He was in that city when it was stormed by the imperialists under Bourbon in 1527, and, it is said, was calmly at work on his picture of 'The Vision of St Jerome' (now in the National Gallery, London) when soldiers, bent on pillage, burst into

his studies. He was, however, protected by their leader. After this event he left Rome on his return, where he printed various important works, and returned to Parma in 1521. Having engaged to execute several extraordinary frescoes in the church of S. Maria Secunda, after repeated delays, he was thrown into prison for breach of contract, and on being released in place of conveying out his undertaking he fled to Giulio Mazzoni, in the territory of Parma, where he died soon afterwards in 1525. Vasari, in his notice of L., mentions his enormous and premature death in his passion for study; but this exaggerated story has been disproved by the recollection of later biographers. He executed several paintings, and some woodcuts are attributed to him.

PARANAHUA, or PARANAHYBA, a river of Brazil, runs in the narrow Rio Grande, between the provinces of Minas and Paulista, about 41° E. It flows north-east and north, and enters the Atlantic along about 41° 40' W. by five mouths, which within a delta about 20 miles wide along the shore flows, mouths, however, are only from two to four miles deep. It drains the provinces of Paulista, and forms the boundary line between it and the province of Maranhão. Total length estimated at 20 miles. A chief tributary of the Parana also bears the name of Parahyba.

PARNASSUS, a mountain greatly celebrated among the ancients, and regarded by the Greeks as the central point of their country. It was in Thessaly. It has three steep peaks, almost always covered with snow, and seen from a great distance, the highest being fully 9000 feet above the level of the sea; but as only two of them are visible from Delphi, it was customary among the Greeks to speak of the two-peaked Parnassus. On its southern slope lay Delphi (q. v.), the seat of the famous oracle, and the fountain of Castalia (q. v.). The highest peak was the scene of the origin of the worship of Dionysus (Bacchus); all the rest of the mountain was sacred to Apollo and the Muses, whence poets came and to 'climb Parnassus,' a phrase still thus employed.

PAROCUTAL GUARD, in Scotland, is the least in such parish which necessitates the relief of the poor. In England, the same duty is performed by overseers, and in some cases by guardians of the poor.

PAROCUTAL RELIEF is the relief given to paupers by the parish authorities. See POOR.

PARODY (Gr. *para*, beside, and *ode*, a song), the name given to a burlesque imitation of a serious poem. Its peculiarity is that it preserves the form, and as far as possible the words of the original, and thereby differs from a Travesty, which is a lower and less liberal kind of burlesque. The invention of parody is commonly ascribed to the Greeks (from whom, at least, we have derived the name), the first parody, according to Aristotle, being *Hesperia* of Theognis, who flourished during the Peloponnesian war; according to others, Hipponax. From the fragments that are extant of ancient parody, we infer that Homer was the favourite subject of comic imitation. Thus Hipponax, in his picture of a glutton, ludicrously compares a comparison between the feats of his hero in eating and those of Achilles in fighting, by comparing as follows:

Big O abundant goddess, Thyrsodian, fount of gluttony.

Thou shouldst devour like Charybdis, eater unreluctant among heroes.

The *Parasymphysis* (Battle of the Frogs and

Mice), erroneously ascribed to Homer, is also a happy and harmless specimen of the parody, which, however, soon began to exchange its serious and instructive railway for a lulling and narcotic haven, of which numerous specimens may be seen in the comedies of Aristophanes; while the philosopher Timon of Phlius invented, under the name of *Allos*, a new species of satirical parody. Among the Romans we first meet with this form of literature in the period of the decline. All the power of Rome could not prevent her verses from being parodied by Persius. Among modern nations the French—as might naturally be expected from their character—have been most addicted to this literary mimicry. Cervantes parodied Chaucer in his *Don Quixote*, and Racine parodied Corneille. The parodies of Desaugiers are considered by his countrymen models of this ingenious kind of literature. Schiller's famous poem of *Das Lull* has been often parodied by German poets. In England, perhaps the best compositions of this nature are the *Defected Addresses* of the lecturers James and Horace Smith. Many will remember, in particular, the parody on Scott's 'Battle of Rob Roy' in *Horace*, ending—

So red 'em
Were the last words of Higginbottom.

Barham's *Twisted Legends* contains a collection purely on Wolfe's *Lines on the Death of Sir John Moore*. We quote the first stanza as a specimen:

Not a son had he got, not a quince or vein,
And he looked most comfortably dreary
As he talked away without paying his debt,
And he hardly after him hurried.

Thackeray's *Moderator* also contains some very clever and satirical prose parodies upon certain of his brother novelists.

The historical development of the parody has been treated by Minor in Dault's and Grosse's *cinquies* (6th vol.). See also Minor's *Parasitism* (18th ed., 1840), and Wieland's *De Principibus Parasitismi Humani* (18th ed., 1855).

PAROLE (literally, a word) is the declaration made on honour by an officer, in a case in which there is no more than his sense of honour to restrain him from breaking his word. Thus a prisoner of war may be released from actual prison on his parole that he will not go beyond certain designated limits; or he may even be allowed to return to his own country on his parole not to fight again during the existing war, against his captors. To break parole is accounted infamous in all civilized nations, and an officer who has so far forgotten his position as a gentleman as to have any claim to the treatment of an honourable man, nor can he expect quarter should he again fall into the hands of the enemy he has deceived.

PAROLE EVIDENCE, in Law, means such evidence as is given by witnesses by word of mouth at a trial or hearing of a cause. Parole Agreement, in English Law, means any agreement made either by word of mouth or by writing not under seal. If the agreement is made by writing under seal, it is called a deed, or indenture, or covenant, according to the nature of its contents.

PAROPAMISA'N MOUNTAINS. See ARGHANISTAN.

PA'ROS, one of the larger islands of the Grecian Archipelago, is situated west of Naxos, from which it is separated by a channel from four to six miles wide. Greatest length, 18 miles; greatest breadth, 9 miles; area, about 77 square miles; pop. 7200. The surface is hilly, the scenery picturesque, and

PAROTID GLAND—PARRAKEET.

the soil naturally fertile, but imperfectly cultivated. The island is especially productive in cotton, wax, honey, partridges, and wild pigeons. Near the middle of the island, the mountain Capresso (ancient *Marpeasa*), abounds in the famous Parian marble, which was used by many of the greatest sculptors of antiquity. Parekhia, on the west coast, is the principal town, and Naussa, on the north east, is the chief port.

In ancient times, P., which is said to have been colonised by Cretans, attained great maritime prosperity, and became wealthy and powerful. It submitted to the Persians; and after the battle of Marathon was assailed ineffectually by Miltiades, who received here the wound of which he soon after died. After the defeat of Xerxes, P. came under the supremacy of Athens, and shared the fate of the other Cyclades. Archilochus, the inventor of Iambic verse, was born here.

PAROTID GLAND. See SALIVARY GLANDS.

PARQUETRY, a kind of wood mosaic used only for flooring. The art of making inlaid wood floors has until lately much declined in this country, but on the continent it has been much in use, and has been carried to great perfection. Parquetry floors are usually of oak, but other and more ornamental woods have also been much used for giving variety and beauty to the pattern. In the more elaborate kinds of parquetry, veneers are used, but it is much more generally composed of blocks of wood squared at the sides, and laid down so as to combine and form a geometric pattern. Of late, the taste for this work has revived in Britain, and it is beginning to be extensively employed in the better class of buildings.

PARR, SAMUEL, LL.D., a once notable scholar, was born January 15, 1747, at Harrow-on-the-Hill. He entered Emmanuel College, Cambridge, in 1765; but the death of his father, two years afterwards, necessitated his doing something for himself, and he was, in consequence, induced to accept an assistant-mastership at Harrow, where he remained five years. The head-mastership then becoming vacant, P. applied for it, but was rejected, whereupon he left, and started as an independent schoolmaster. In 1777, he was appointed Master of Colchester School, where he was ordained priest, and obtained the curacies of Hythe and Trinity Church. Next year, he became Master of Norwich School; but in 1786, settled at Hatton in Warwickshire, where he spent the rest of his life. In 1787, he published an edition of Bellenden, to which he prefixed his celebrated preface, which is as remarkable for its uncompromising advocacy of Whig principles as for the scrupulous Ciceronianism of its Latinity. He died March 6, 1825.

It is almost impossible to understand the reputation which P. once had. None of his voluminous writings justify it. That he was in some respects an accomplished, and even a great scholar, is undoubted, for he could write Latin of Ciceronian purity and finish; but it is equally undoubted that he never did anything with his boasted scholarship. P. has left the world absolutely nothing to keep it in remembrance of him, yet his complete works (edited by Dr J. Johnstone in 1828)—exclusive of his contributions to periodicals—form eight enormous tomes, and contain 5734 octavo pages, many of them printed in small type. They relate to matters historical, critical, and metaphysical, but in all of them 'the thread of Parr's verbosity is finer than the staple of his argument.' What, then, gave him the fame that he certainly enjoyed during his life? Beyond all question, it was his conversational powers. He was an amazing, an overwhelming

talker. Bold, dogmatic, arrogant, with a memory profoundly and minutely retentive, and with a genuine gift of ephemeral epigram, he seemed, at the tables of statesmen, and wits, and divines, to be a man of tremendous talent, capable of any literary feat; but the learning and the repartee have left little trace of their existence, and posterity declines to admire the wonders that it has neither seen nor heard. See De Quincey's famous essay on 'Dr Samuel Parr on Whiggism in its Relations to Literature' (Author's edition, vol. 5. Edin. Adam and Charles Black, 1862).

PARRA. See JACANA.

PARRAKEET, or **PARROQUET**, a name very commonly given to many of the smaller species of the parrot family; generally to species having long tails, and natives of the East Indies, Africa, and Australia, not so frequently to American species; although it is sometimes also applied to some of these, indifferently with the name Parrot.—One of the most beautiful groups of the *Psittacidae*, combining gracefulness of form with splendour of plumage, is that to which the *ALEXANDRINA* P. or *RING P.* (*Palæornis Alexandri*) belongs. It is about the size of a common pigeon, green, with a red collar, whence its name Ring P., and is a native of the

Warbling Grass or Zebra Parrakeet (*Melopsittacus undulatus*).

East Indies. It is said to have been brought to Europe by some of the members of Alexander the Great's expedition to India, and to have been the first of the parrot tribe known to the Greeks and Romans, by whom it was highly prized, as it still is, not only for its beauty, but for its docility and its power of imitating human speech. Like many of its tribe, it is gregarious, and immense flocks make their abode in some of the cocoa-nut groves of the western parts of Ceylon, filling the air with the most deafening screams. The Ring P. has many congeners, natives chiefly of the East Indies, exhibiting much variety of splendid plumage.—Somewhat like them in length and form of tail, but with longer and stronger legs, is the **GROUND P.**, or **GROUND PARROT** (*Pezophorus formosus*), of Australia, a bird

very common in all the southern parts of New Holland and in Van Diemen's Land, inhabiting woods or ground covered with very low underwood. It would not be very unlike those of parrots in general; it runs along the ground, and even seeks to escape from enemies by running, unwillingly taking wing and runs only for a short low flight. It makes no sound but the noise in a hole in the ground. It is a small bird, not much more than 12 inches in entire length, one half of which is occupied by the tail, the colour, dark green above, yellowish below, but brilliant than in many of the parrot tribe, but faintly marked and marked. Its flesh has a very strong musky flavour. There are numerous other Australian species, distributed in several genera, some of which, although less profusely than that just named, live and seek their food on the ground. Some of them exhibit the greatest splendour of plumage. The only one we shall notice is the *Red-tailed Parrot* (*Myiophobus carolinensis*), a very beautiful species, which has often been brought to England, and has sometimes lived in it. In the most inland places of Australia, this P. is to be seen in flocks of many hundreds feeding on the seeds of the grasses, which afford food also to many other small species.

PARROT-BIRD, one of the greatest painters of ancient Greece, was the son of Exonius, himself an artist, and was born at Ephesus in the 5th c. B.C. He pursued his profession, however, at Athens, the inhabitants of which held him in high estimation, and conferred on him the rights of citizenship. He was already celebrated in the time of Alexander, with whom, according to Nepos, he had a conversation (*Mem.* 2, 10), and was also a younger contemporary of Zeuxis. The date of his death is unknown. Pliny, who lived several hundred years after, tells a monstrous story about him. He says that when P. was painting his "Demosthenes Vinctus" he got hold of one of the pictures taken at the capture of Clytemnestra by Philip of Macedon (347 B.C.), and crucified him in his studio that he might copy from life the expression of agony. Fortunately for P.'s memory, the mistake is almost certainly untrue, as it would require us to suppose that he was still alive and painting when upwards of 100 years old. P. appears to have surpassed all his predecessors in purity of design, accuracy of drawing, force of expression, and what is technically called 'finish.' According to Pliny, he was the first who established a true proportion between the different parts of a picture, and animated with elegance and profusion all the members of the features, even to those evanescent tissues that betray the most delicate sentiments of the soul. He painted the extremities, such as the hands and fingers, in so exquisite a style, that the inanimate parts seemed relatively—but only relatively—animate. Quintilian calls him the legislator of his art, because his canon of proportion for gods and heroes was followed by all contemporaries and subsequent painters. Among his works were an apparently symbolic picture of the Athenian Demos (P. People); a "Thersites," a "Naval Commander in full Armour," "Ulysses feigning Madness," "Gaster and Pollex," "Dionysus and Virtus," a "Marsus," "Heracles," and "Nereus" on one canvas, a "Greece Seized with a Child in her Arms," a "Puer standing with a Child bearing Incense," "Two Young Children," an "Achilles," an "Agamemnon," &c. But his subjects were not always of a pious or lofty character. His "Archipolus" (high priest of Apollo), and his "Mithras and Alalanta" were most dissolute representations, and gave such offence to the Emperor Titus, a man of celebrated severity, that he kept them in his

bedroom, and valued the second in particular at more than a million sesterces.

P. was of an excessively proud and arrogant disposition. He called himself the prince of painters, and claimed to be descended from Apollo; he also painted himself as the god Mercury, and then exposed his own portrait for the adoration of the crowd. His vanity was equal to his pride, and showed itself even in his apparel, which was of the kind called 'gorgonee.' He generally dressed in a purple robe with a golden fringe, wore a gold-headed cane, and wore boots tied with golden clasps.

PARROT (*Lat. parvula*) is rather a popular than a legal term. In the Roman law it comprehended every one who purchased a cow, a slave, but in English the term is usually confined to the purchase of one's father, or of one who is in law *parvulus*. The *parvulus* does not, in any respect, differ in status from the purchase of a stranger; in both cases, the punishment is death by hanging. In the Roman law, a *parvulus* was punished in a much more severe manner, being served up in a leather sack, along with a live snake, viper, dog, and ape, and cast into the sea to take his last with these companions.

PARROT (*Palmaria*), a Linnaean genus of birds, now the family *Palmaridae*, of the order *Columbiformes*, or *Columbæ* (q. v.), comprehending a vast number of species, natives of almost all tropical and sub-tropical regions; a few species extending further north and south, in America, in New Zealand, and in Van Diemen's Land, even to the neighbourhood of Lake Michigan in North America, and to Terra del Fuogo in South America. They are mostly birds of splendid plumage; they vary very much in size, from the Great Macaw, more than three feet in length, tail included, to the little Love-birds, not larger than sparrows. They are mostly gregarious, and are often seen in vast flocks, generally inhabiting forests, and making their nests in trees, feeding chiefly on fruits and seeds, partly also on leaves and buds; but some of them dwelling in open plains, feeding on the seeds of grasses and other plants of humble growth, bulbs and succulent parts of vegetables, and living mostly on the ground. The voices of the P. tribe are generally harsh and discordant, although some of the smaller kinds have not unpleasant voices; but many of the larger have a remarkable power of imitating human speech, and in demonstration become capable of articulating not only words but sentences. They exhibit a greater degree of intelligence than usual in birds, with a monkey-like restlessness and love of tricks; and although shrewd and affectionate, are generally of capricious irritable temper. They have a short, stout, hard beak, rounded on all sides, and developed at the base in a membrane in which the nostrils are placed; the upper mandible generally much larger than the lower, much curved, and sharp pointed. The tongue is almost always very large, thick, round, and fleshy; the muscles which move the mandibles are more numerous and powerful than in most other birds. They make use of the powerful hooked bill as well as of the feet in climbing trees; and employ their feet as hands for holding their food, and bringing it up to the mouth. Their feet differ from those of all the other columbiforms, in being covered with small tubercle-like scales instead of plates. Some have short and some have long tails. Most of them have short wings. Their testicles are very long and slender, and without cover.

The *Palmaridae* are easily distinguished from all other birds; but their division into distinct subordinate groups has not been found so easy.

PARROT-FISH—PARRY.

Whilst the name P. popularly includes all, except that it is seldom given to some of the smallest species, some are known by the names Macaw, Cockatoo, Parrakeet, Lory, Love-bird, &c. See these heads. But some of these names are very vaguely applied. And although the P. family is regarded as consisting of a number of very natural groups, the characters and limits of these groups have not yet been very well defined.

The name P., in its most restricted sense, is sometimes applied only to those species which have the upper mandible very distinctly toothed, the lower mandible longer than it is high; and the tail short, and square or rounded; but this use is rather ornithological than popular, the most restricted popular use equally including long-tailed species, such as the Caroline P., which are ornithologically ranked with the macaws.—The CAROLINE P. (*Conurus Carolinensis*) is the species of which the northern range extends far beyond all others of its tribe to the shores of Lake Michigan; although by the increase of cultivation, and the war waged against these birds for their depredations on orchards and corn-ricks, their numbers have been greatly diminished in regions where they were once plentiful. Its whole length is about 14 inches, of which about one half is occupied by the tail; the general colour is green, shaded with blue, and diversified with orange, the wing primaries almost black. It is gregarious, prefers to roost in the holes of hollow trees, and in such situations also the females lay their eggs. It seems to love salt, frequenting salt licks like pigeons. It is easily tamed, but does not acquire the power of articulation.—Of the short-tailed parrots, one of the best known is the GRAY P. (*Psittacus erythacus*), a West African species, about the size of a small pigeon, of an ash-gray colour, with a crimson tail. It is famous for its docility, its power of articulation and of imitating noises of all kinds, its loquacity, and its mischievousness. It is very often brought to Europe, and often lives to a great age in confinement. Individuals have been known to attain the age of nearly 100 years.—The GREEN PARROTS (*Chrysotis*), natives of the tropical parts of South America, are also among the short-tailed parrots most frequently seen in Britain.

PARROT-FISH (*Scarus*), a genus of fishes of the family Labridæ (q. v.) or Cyclo-Labridæ, of oblong and massive form, with large scales, and remarkable for the structure of their jaws and

Parrot-fish (*Scarus harid*).

teeth, the jaws being divided into halves by a median suture, the teeth incorporated with the bone in crowded quincuncial order, the surface even and polished in some species and rough in others, the oldest teeth forming the trenchant border of the jaw, and being succeeded by others as they are worn away, whilst new ones are formed behind.

The species are numerous. Some of them feed on fuci, and some on corals, the younger branches of which they crush, so that the animal part affords them nourishment, whilst the calcareous part is rejected. They are fishes generally of brilliant colours, some of them of wonderful splendour, and have received the name parrot-fish partly on this account, and partly on account of a fancied resemblance in their jaws to a parrot's bill. Most of them are natives of tropical seas. One species is found in the Mediterranean (*S. Creticus*), the *Scarus* of the ancients, of which many wonderful stories were told, as to its love, its wisdom, its ruminating, its emitting of sounds, &c., and which was esteemed the most savoury and delicate of all fishes. It is still held in high esteem for the table. The Greeks cook it with a sauce made of its own liver and intestines.

PARRY, SIR WILLIAM EDWARD, commonly known as SIR EDWARD PARRY, a celebrated English navigator, was born at Bath, 19th December 1790. His father, who was a physician of some eminence, destined him for the medical profession; but acting on the advice of a friend, entered him as a first-class volunteer on board the *Ville-de-Paris*, the flag-ship of the Channel fleet, in 1803. After several years' service, he received his commission as lieutenant, January 6, 1810. Though thus early engaged in active service, his education had not been neglected; he had attained at school to considerable eminence in classical knowledge; and for the first five years after entering the navy, he had particularly studied French and mathematics under the chaplain's superintendence, after which he constantly employed his leisure time in nautical and astronomical studies. In February 1810, he was sent to the Arctic regions in command of a ship, for the purpose of protecting the British whale fisheries and improving the admiralty charts of those regions; but in 1813, he was recalled and despatched to join the fleet then blockading the coast of the United States. He remained on the North American station till the spring of 1817, and during this time he wrote and distributed MS. copies of a work entitled *Nautical Astronomy by Night*, in which rules were given for determining accurately the altitude of the pole by observations of the fixed stars. This work he subsequently published in London. Having returned to England too late to take part in the African exploring expedition, he was, at his urgent request, backed by the recommendations of Mr Barrow, secretary to the Admiralty, appointed to the command of the *Alexander*, under the orders of Captain John Ross in the *Isabella*, and despatched in search of the 'North-West Passage' (q. v.) in April 1818. The expedition returned to England, having made no important discoveries. The admiralty were dissatisfied with the report of Captain Ross; and P.'s opinion, though only communicated to his private friends, having become known to them, he was again sent out (May 1819), and this time commenced that career of discovery (see NORTH-WEST PASSAGE) which has immortalised him as the greatest of all Arctic explorers. P. on his return to Britain was hailed with the utmost enthusiasm, and was made commander (4th November 1820) and a member of the Royal Society. He subsequently made a second and a third voyage to the same regions, but effected nothing further of importance. P. now devoted himself to the discharge of his duties as hydrographer, but such labours were too monotonous for one of his temperament, and he accordingly prepared a plan of an expedition for reaching the north pole, which being submitted to the admiralty and approved of

by them, his old ship the *Arctis* was fitted out for a polar expedition and F. set sail in her, accompanied by Lieutenant J. C. Ross. 4th April 1857. See *Parses Voyages*. The *Journal* of these voyages was published by order of the Admiralty.

F.'s career as an explorer was now closed, and he again returned to his duties as hydrographer, but his health now gave way under this sedentary mode of life, and he exchanged his office for that of commissioner to the Agricultural Company of Australia, the whole country he sailed 26th July 1859. He returned to England in November 1861, and died in succession various government appointments up till December 1866, when he retired from service entirely, receiving a sinecure office. On 4th June 1867 he was raised to the rank of Rear Admiral of the White, and in the following year was appointed Superintendent of Greenwich Hospital—an office which he held till his death, 7th July 1867, at Lime in Germany, whither he had gone for the benefit of his health. A complete sketch of his voyages was published in 1863 (Lond. 8 vols.). His life has been written by his son, the Rev. Edmund Percy, M.A. of Dulwich College, dated 1867.

PARSEES (People of Pars or Pars, i.e. ancient Persia) as the name of the small remnant of the followers of the ancient Persian religion, as reformed by Zoroastri, or Zoroaster, as he is commonly called. They are also known under the denomination of *Goodies*, under which head some account will be found respecting their recent history and present condition. The pre-Zoroastrian phase or phases of their original religion will probably for ever remain shrouded in deep obscurity; so much, however, is fully established by recent investigations, that this, and what afterwards became the Brahmanic religion, were originally identical; that in consequence of certain social and political conflicts between the Iranians and the Aryans who afterwards peopled Hindooistan Proper, an undying feud arose, in the course of which the former forewore even the holiest common faith, and established a counter faith (*Ahura*), a principal dogma of which was the reformation of the ancient, now hostile, gods into deities, and the founding of the entire *Deva* religion as the source of all mischief and wickedness. Zoroastri, the prophet, whose era is given very differently by ancient writers and by modern investigators, placed somewhere between 590 or 600 B.C. (Bab.) and 1200 A.D. (Haug), had, like all prophets and reformers, many predecessors, chiefly among the *Soudasantes* or Fire-priests (*Atashvans*); yet to him belongs the decisive act of separating for ever the competing parties, and of establishing a new community with a new faith—the *Maneyasna* or *Parses* religion proper, which absorbed the old *Ahura* religion of the fire-priests. Referring for a summary of what is known and speculated about the person of the great reformer to the article under his name, we shall here confine ourselves to pointing out, as the characteristic of his leading doctrine, that the personality of his theology was as pure a Monotheism as ever the followers of the Jehovahite faith were acquainted with. He taught the existence of but one deity, the *Ahura*, who is called *Mazda* (see *Ormuzd*), the creator of all things, to whom all good things, spiritual and worldly, belong. The principle of his speculative philosophy is Dualism, i.e. the supposition of two principal causes of the real and intellectual world: the *Vohu Manô*, the Good Mind or Goodness (*Days*), and the *Akam Manô*, the Evil Mind, or Non-reality (*Apôriti*); while the principle of his moral philosophy is the triad of *Thought, Word, and Deed*. Not long, however, did the principles of Monotheism prevail. The two sides

of *Ahura Mazda's* being were taken to be two distinct personages—God and Devil—and they each took their due place in the *Parses* pantheon in the course of time—chiefly through the influence of the sect of the *Zendiks*, or followers of the *Zend*, i.e. *Interpretation*. According to Zoroastri, there are two intelligences, as there are two lives—one *material* and one *spiritual*; and, again, there must be distinguished an *earthly* and a *future* life. The immortality of souls was taught long before the *Parses* had adopted this belief. There are two abodes for the departed—*Heaven* (*Vandana*), the House of the *Angels* (*Hamas*, *Yamas*, xxviii. 10, xxvii. 2, of *Is. vi*, *Isaiah*, &c.) and *Hell* (*Drau*), *Hell* (the residence of devils and the place of the *Evil* religion). Between the two there is the *Bridge* of the *Just* or *Right*, which the souls of the good alone can pass. Those who in a general confession, which is to precede the last judgment, to *Isaiah*, which *Soudas* (*Soudas*), the son of *Isaiah*, spiritually begotten (by later priests divided into three persons), will be sent by *Ormuzd* (the world, which by that time will be utterly steeped in wickedness, darkness, and sin, will then be renewed; death, the accident of creation, will be slain, and life will be everlasting and holy. These are the outlines of the Zoroastrian creed, as it flourished up to the time of Alexander the Great, throughout ancient Persia, including Upper Tibet, Cabulistan, Sogdiana, Bactriana, Media, Persia, &c.; and it is curious to speculate on the consequences which might have followed Marathon and Salamis had the Persians been victorious. The religion of *Ormuzd* would have dethroned the Olympians, as it dethroned the gods of the Assyrians and Babylonians; and it would certainly have left its traces upon the whole civilised world unto this day in a much more direct and palpable shape than it now does. Even the death of Alexander, however, it gradually lost ground, and rapidly declined under his successors, until, in the time of Alexander Severus, Ardashir 'Arman' (cf. *Mirkhad* ap. de Sacy, *Mémoires sur les Ant. de la Perse*, &c., p. 59), the son of Babagan, called by the Greeks and Romans Artaxerxes or Artabazus, who claimed descent from the ancient royal lineage of Persia, took the field against Artabanus, and slew him (25), thus putting an end to the four hundred years' rule of the Parthians, and founded the Sassanid dynasty. This he effected in conjunction with the national *Parses*, who hated the 'semi-Greek' dynasty of the Arsacids, their leaning to the foreign, and contempt for the *Zend* religion, and finally for their powerlessness against the spreading conquests of the Romans. The first act of the new king was the general and complete restoration of the partly lost, partly forgotten books of Zoroastri, which he effected, it is related, chiefly through the inspiration of a Magian Sage, chosen out of 40,000 Magians. The sacred volumes were translated out of the original *Zend* into the vernacular, and disseminated among the people at large, and fire temples were reared throughout the length and breadth of the land. The Magi or priests were all-powerful, and their hatred was directed principally against the Greeks. 'Far too long,' wrote Ardashir, the king, to all the provinces of the Persian empire, 'for more than five hundred years, has the poison of Aristotle spread.' The fanaticism of the priests often also found vent against Christians and Jews. The latter have left us some account of the tyranny and oppression to which they as unbelievers were exposed—such as the prohibition of fire and light in their houses on Persian fast-days, of the slaughter of animals, the baths of purification, and the burial of the dead according

to the Jewish rites—prohibitions only to be bought off by heavy bribes. In return, the Magi were cordially hated by the Jews, and remain branded in their writings by the title of demons of hell (*Kidushin*, 72 a.). To accept the instruction of a Magian is pronounced by a Jewish sage to be an offence worthy of death (*Shabb* 75 a.; 156 b.). This mutual animosity does not, however, appear to have long continued, since in subsequent times we frequently find Jewish sages (Samuel the Arian, &c.) on terms of friendship and confidence with the later Sassanide kings (cf. *Moed Katan*, 26 a. &c.). From the period of its re-establishment, the Zoroastrian religion flourished uninterrupted for about 400 years, till, in 651 A.D., at the great battle of Nahavand (near Ecbatana), the Persian army, under Yezdezhird, was routed by the Calif Omar. The subsequent fate of those that remained faithful to the creed of their fathers has been described, as we said before, under GUEBRES. At present, some remnants inhabit Yazd and Kirmân, on the ancient soil of their race; others, who preferred emigration to the endless tribulations inflicted upon them by the conquering race, found a resting-place along the western coast of India, chiefly at Bombay, Surat, Nawsari, Achmedabad, and the vicinity, where they now live under English rule, and are recognised as one of the most respectable and thriving sections of the community, being for the most part merchants and landed proprietors. They bear, equally with their poorer brethren in Persia, with whom they have of late renewed some slight intercourse for religious and other purposes—such as their Rivâyets or correspondences on important and obscure doctrinal points—the very highest character for honesty, industry, and peacefulness, while their benevolence, intelligence, and magnificence outvies that of most of their European fellow-subjects. Their general appearance is to a certain degree prepossessing, and many of their women are strikingly beautiful. In all civil matters they are subject to the laws of the country they inhabit; and its language is also theirs, except in the ritual of their religion, when the holy language of Zend is used by the priests, who, as a rule, have no more knowledge of it than the laity.

We have spoken of the leading fundamental doctrines as laid down by their prophet. Respecting the practical side of their religion, we cannot here enter into a detailed description of their very copious rituals, which have partly found their way into other creeds. Suffice it to mention the following few points. They do not eat anything cooked by a person of another religion; they also object to beef, pork, especially to ham. Marriages can only be contracted with persons of their own caste and creed. Polygamy, except after nine years of sterility and divorce, is forbidden. Fornication and adultery are punishable with death. Their dead are not buried, but exposed on an iron grating in the Dokhma, or Tower of Silence, to the fowls of the air, to the dew, and to the sun, until the flesh has disappeared, and the bleaching bones fall through into a pit beneath, from which they are afterwards removed to a subterranean cavern.

Ahuramazdao being the origin of light, his symbol is the sun, with the moon and the planets, and in default of them the fire, and the believer is enjoined to face a luminous object during his prayers. Hence, also, the temples and altars must for ever be fed with the holy fire, brought down, according to tradition, from heaven, and the sully of whose flame is punishable with death. The priests themselves approach it only with a half-mask (Penom) over the face, lest their breath should defile it, and never touch it with their

hands, but with holy instruments. The fires are of five kinds; but however great the awe felt by Parsees with respect to fire and light (they are the only eastern nation who abstain from smoking), yet they never consider these, as we said before, as anything but emblems of Divinity. There are also five kinds of 'Sacrifice,' which term, however, is rather to be understood in the sense of a sacred action. These are—the slaughtering of animals for public or private solemnities; prayer; the Daruns sacrament, which, with its consecrated bread and wine in honour of the primeval founder of the law, Hom or Heomoh (the Sanscr. *Soma*), and Dahman, the personified blessing, bears a striking outward resemblance to the sacrament of the Lord's Supper; the sacrifice of Expiation, consisting either in flagellation, or in gifts to the priest; and, lastly, the sacrifice for the souls of the dead. The purification of physical and moral impurities is effected, in the first place, by cleansing with holy water (Nirang), earth, &c.; next, by prayers (of which sixteen, at least, are to be recited every day) and the recitation of the divine word; but other self-castigations, fasting, celibacy, &c., are considered hateful to the Divinity. The ethical code may be summed up in the three words—purity of thought, of word, and of deed: a religion 'that is for all, and not for any particular nation,' as the Zoroastrians say. It need hardly be added, that superstitions of all kinds have, in the course of the tribulations of ages, and the intimacy with neighbouring countries, greatly defiled the original purity of this creed, and that its forms now vary much among the different communities of the present time.

Something like a very serious schism, however, has lately broken out in the Parsee communities, and the modern terms of Conservative and Liberal, or rather bigot and infidel, are almost as freely used with them as in Europe. The sum and substance of these innovations, stoutly advocated by one side, and as stoutly resisted by the other, is the desire to abolish the purification by the Nirang—a filthy substance in itself—to reduce the large number of obligatory prayers, to stop early betrothal and marriage, to suppress the extravagance in funerals and weddings, to educate women, and to admit them into society. Two counter alliances or societies, the 'Guides of the Worshipers of God' and 'the True Guides' respectively, are trying to carry out at this moment, by means of meetings, speeches, tracts, &c., the objects of their different parties.

The literature of the Parsees will be found noticed under PERSIAN LANGUAGE AND LITERATURE, and ZEND-AVESTA. Besides the latter, which is written in ancient Zend, and its Gujarati translation and commentaries, there are to be mentioned, as works specially treating of religious matters, the *Zardushti-Namch*, or Legendary History of Zerdusht; the *Sadler*, or Summary of Parsee Doctrines; the *Dabistan*, or School of Manners; the *Desattr*, or Sacred Writings, &c. All these have been translated into English and other European languages.

On the influence Parsism has had upon Judaism and its later doctrines and ceremonial, and, through it, upon Christianity and Mohammedanism—which besides drew from it directly—we cannot dwell here at any length. So much, however, may be stated, that the most cursory reading of the sacred Parsee books will shew, in a variety of points, their direct influence upon the three Semitic creeds. Of works treating on the subject of this article, we mention principally, Hyde, *Vet. Rel. Pers. Hist.* (Oxon. 1760, 4to); Ouseley, *Travels in the East* (Lond. 1819); Anquetil du Perron, *Exposition des Usages des*

the civil wars, its possession was constantly disputed, until after 1690, when the Parsons family was finally established in possession of the castle and adjoining lands. About this time, Birr returned two members to parliament, but the privilege was a temporary one. The castle has been rebuilt. The modern P. is one of the handsomest and best built and appointed inland towns in Ireland, with two handsome churches, and several meeting-houses, a nunnery, a handsome pillar with a statue of the Duke of Cumberland, a town-hall, a library, literary institute, a model and other schools. But the great attractions of P. are the castle, the observatory, and the laboratory of the Earl of Rosse (q. v.). P. is an important corn-market, a considerable centre of inland commerce; but with the exception of a distillery and brewery, it is almost entirely without manufactures. It is a large military station, and is also the seat of a Union workhouse.

PÂRSWANÂTHA, the twenty-third of the deified saints of the Jains, in the present era. He and *Mahavira*, the twenty-fourth, are held in highest esteem, especially in Hindustan. In a suburb of Benares, called Belupura, there is a temple honoured as the birthplace of Pârs'wanâtha. See JAINAS.

PART, in Music. When a piece of music consists of several series of sounds performed simultaneously, each series is called a part.

PARTERRE, in gardens laid out in the old French style, the open part in front of the house, in which flower-beds and closely-cut lawn were intermingled according to a regular plan.

PÂRTHENOGENESIS (from the Gr. *parthenos*, a virgin, and *genesis*, the act of production) is a term invented by Professor Owen to indicate propagation by self-splitting or self-dividing, by budding from without or within, and by any mode save by the act of impregnation; the parthenogenetic individuals being sexless or virgin females. See the article GENERATIONS, ALTERNATION OF. For many remarkable facts in relation to parthenogenesis in insects, the reader is referred to Professor Owen's eighteenth lecture, *On the Comparative Anatomy and Physiology of Invertebrate Animals*; and to Siebold, *On Parthenogenesis*, translated by Dallas.

PÂRTHENON, the temple of Minerva at Athens; one of the most celebrated of the Greek temples, and usually regarded as the most perfect specimen of Greek architecture. Many of the sculptures have been brought to England, and are now in the British Museum. See GRECIAN ARCHITECTURE.

PARTHENOPEAN REPUBLIC (from *Parthenope*, the oldest name of the city of Naples) was the name given to the state into which the kingdom of Naples was transformed by the French Republicans, 23d January 1799, and which only lasted till the following June, when the invading army was forced to retreat.

PÂRTHIA, anciently a country of Western Asia, lying at the south-east end of the Caspian Sea, from which it was separated by a narrow strip, known as Hyrcania, now forms the northern portion of the province of Khorassan, and is an almost wholly mountainous region. Its rivers are merely mountain torrents, which are supplied by the melting snow on the Elburz range during winter and spring, but are mostly dry in summer and autumn.

The original inhabitants are believed to have been of Scythian race, as shewn by their language as well as by their manners, and to belong to the great Indo-Germanic family. If this be the case, as is very probable, the term Parthian, from its analogy

to the Scythian word *parthe*, banished, seems to indicate that they were a tribe who had been driven to P. out of Scythia (i. e., Central Asia). The Parthians, during the time of the Roman Republic, were distinguished by primitive simplicity of life and extreme bravery, though at the same time much given to bacchanalian and voluptuous pleasures. They neglected agriculture and commerce, devoting their whole time to predatory expeditions and warfare. They fought on horseback, and after a peculiar fashion. Being armed solely with bows and arrows, they were rendered defenceless after the first discharge; and, to gain time for adjusting a second arrow to the bow, turned their horses, and retired, as if in full flight, but an enemy incautiously pursuing, was immediately assailed by a second flight of arrows; a second pretended flight followed, and the conflict was thus carried on till the Parthians gained the victory, or exhausted their quivers. They generally discharged their arrows backward, holding the bow behind the shoulder; a mode of attack more dangerous to a pursuing enemy than to one in order of battle. The Parthians first appear in history as subject to the great Persian Empire. After the death of Alexander the Great, P. formed part of the Syrian kingdom, but revolted under Antiochus II., and constituted itself into an independent kingdom under the *Arsacids* (see ARSACES), 250 B.C., a race of kings who exercised the most completely despotic authority ever known, treating their subjects as if the vilest of slaves; yet so accustomed did the Parthians become to this odious rule, that some of the later monarchs, who had received a Roman education, and after their accession treated their subjects with ordinary justice and humanity, were completely despised. The capital of the Parthian monarchy was Hecatompylos ('the city of the hundred gates'), now Damgan. The Parthian dominion rapidly extended to the Euphrates on the west and the Indus on the east, and became a most powerful and flourishing empire; Seleucia, Ctesiphon—the capital of the Persian emperors of the Sassanids—and other celebrated cities date their rise from this period, and soon eclipsed, in size and splendour, the ancient Hecatompylos. In spite of repeated attacks on the part of the Romans, the Parthians maintained their independence (see CRASSUS, SURENA); and though Trajan, in 115–116 A.D., seized certain portions of the country, the Romans were soon compelled to abandon them. In 214 A.D., during the reign of Artabanus IV., the last of the Arsacids, a revolt, headed by Ardshir, son of Babegan, broke out in Persia, and the Parthian monarch, beaten in three engagements, lost his throne and life, while the victor substituted the Persian dynasty of the *SASSANIDS* (q. v.) for that of the *Arsacids*. Some scions of the Parthian royal family continued for several centuries to rule over the mountainous district of Armenia, under the protection of the Romans, and made frequent descents upon Assyria and Babylonia; but their history is obscure and of little importance.

PARTIAL LOSS, in the law of Marine Insurance, is a loss which is not total; and therefore the insurer is not entitled to abandon or give up the remains of the ship or cargo, and claim the entire insurance money; but he is bound to keep his ship or goods, and claim only in proportion to his actual loss or damage.

PÂRTRICIPLE (Lat. *participium*, part-taking) the name of a class of words which have the meaning of a verb with the form of an adjective. The name is said to have been given from their partaking of the nature both of a verb and of an adjective.

PARTIC - PARTNERSHIP.

PARTIC (pronounced *partice*) makes the participle a distinct part of speech, but it is more commonly classed as a sort of the conjugation of the verb. There are in English three participles now in use, usually called the present, but properly the imperfect, because it expresses continued, continued action, e.g., *loving, weeping*; and the other expressing past action, and called either in *ed* or in *en*, e.g., *loved, written*. In Anglo-Saxon and Old English, the imperfect participle ended in *ing*, e.g., *lofend, dancend*, corresponding to the modern *love, dance*. The perfect participle, on the other hand, was *loved, written*. In the sentence, 'He is writing a letter,' *writing* is the imperfect participle; in 'the writing of the letter occupies him,' or 'writing is a difficult art,' it is a substantive, and had a different origin. In the latter case, *ing* corresponds to the Anglo-Saxon termination *-ung*, used in forming substantives from a large class of verbs; thus, Anglo-Saxon *lofend* (*loving*) is equivalent to *loving* and *lovingness* for last, *lovedness*; similarly, modern *loving*, *lovingness*, *amplification*, from *amplify*, in substantives. Such a phrase as, 'while the letter is written,' seems to be a shortened form of the now antiquated, 'in *writing*,' which was originally, 'in *the writing*.' Although this mode of expression is little in vogue now to signify, it is briefer and more idiomatic than the circumlocution of, 'as being written,' which is often substituted for it. The verbal substantive in *-ing* is often exactly equivalent to the substantive; thus, 'standing long in one position is painful' = 'to stand, for.' It has this advantage, that while it can be construed as a noun, e.g., with a possessive case, it can remain at the same time the usual adjunct of a verb; as, 'What are we to infer from the king's dismissing his minister?' The use of this form contributes not a little to the peculiar brevity and strength of the English language.

PARTHUR, a town of Scotland, in the county of Dumfriesshire, situated, chiefly on a rising ground at the bottom, immediately above its junction with the Clyde, and about three miles west-north-west of the town of Glasgow, of which city it now forms a suburb. Nine-tenths of the workmen of P. are employed in ship-building, and there are numerous ship-building yards, flour-mills, cotton factories, and glass-works. A large proportion of the inhabitants are engaged in business in Glasgow, and for their accommodation extensive ranges of handsome villas have been built here. Pop. 1851, 3131; 1861, 3112.

PARTINICO, MATA DI, a port-town of Sicily, in the province of Palermo, and 19 miles south-west of the city of that name. At the foot of a grand precipitous red limestone. The plain in the vicinity is of surpassing fertility; corn, wine, oil, fruit, and flowers are produced in rich abundance; and linen and woollen goods are manufactured. Pop. 15,658. Ruined vestiges of ancient habitations are still to be seen on the summit of the heights above the town, and are said to be the ruins of the ancient *Partinico* mentioned in the *Itinerary* of Antonine and there only.

PARTISAN is a name for a halberd or pike, or for a mounted legion. The name is also given to the leader of a detached body of light troops, who make war by harassing the enemy, rather than going to direct fighting, by cutting off stragglers, intercepting his supplies, and confusing him by some stratagem. The action of such a corps is known as *Partisan warfare*.

PARTITION, a thin interior wall dividing one room from another. It is usually of brick-work 4½ or 3 inches thick, or of timber with sheathing plane 4½ inches thick covered with lath

and plaster. Wooden partitions are used when there is no sufficient support for brick. When there have to carry joists or any other weight, they ought to be constructed in the form of a truss (q. v.).

PARTITION, or **PARTITION**, in Music. See **SCORE**.

PARTITION LINES, in Heraldry, those dividing the shield in directions corresponding to the ordinaries. According to the direction of the partition lines, a shield is said to be party or parted per fess, per pale, per bend, per chevron, per saltire;

Partition Lines in Heraldry.

a shield divided by lines in the direction of a cross is said to be quartered, and a shield parted at once per cross and per saltire, is said to Girouche (q. v.) of eight. The partition lines are not always plain; they may be signified, inverted, embattled, wavy, notched, dancette or raguly—forms which will be found explained under separate articles.

PARTNERSHIP, in the law of England, is the union of two or more individuals acting under a contract, whereby they mutually contribute their property or labour for the purpose of making profits jointly. When a partnership is confined to a particular transaction or speculation, it is usually called a joint-adventure, and the parties are joint-adventurers. The usual criterion by which a partnership is ascertained to exist, as distinguished from other arrangements, is that there is a community of profit; it is not essential that both should suffer losses equally or proportionably, for one partner may stipulate that he shall not be liable to loss. This stipulation is binding between the partners, but of course is insufficient to prevent the partners from being all liable to third parties. So one partner may contribute all the capital or all the labour. A dormant partner is one whose name does not generally appear to the world as a partner, but who nevertheless is to all intents and purposes a partner, with equal rights and liabilities to the rest. In order to constitute that kind of community of profit which is the chief ingredient in a partnership, it is necessary that the partner share in the profits as a partner; for in many cases, clerks, servants, or agents receive a commission or remuneration proportioned to profits, and yet are not partners, for this is merely one mode of ascertaining the salary which they are to receive. In all such cases, therefore, the distinction as to whether there is a partnership or not turns on the consideration whether the alleged partner receives a share of the profits, as such, or merely receives a salary proportioned to profits, without having a specific interest in the firm. The contract of partnership may be entered into either by word of mouth or in writing. If no specified term be agreed upon, it is a partnership at will, and may be dissolved by either of the parties at pleasure. Sometimes, also, the Court of Chancery will interfere to dissolve the partnership before the

time appointed; but this only happens when some unforeseen and urgent reason exists, as that one of the partners has become a lunatic, or has proved grossly dishonest, or the object of the partnership cannot be carried out. Mere differences of opinion on minor matters are no ground for seeking a dissolution. The partners may make any kind of arrangement between themselves that they think proper; but if these are unusual and special stipulations, there is no certainty of securing the same being adhered to, without a formal deed or indenture of partnership being executed. Thus, it is common to stipulate as to the capital each is to contribute, and as to the proportion of profits he is to receive, as to what is to be done in case of the death of a partner, &c. Unless a stipulation is made to the contrary, the rule is, that the death of one of the partners dissolves the partnership. So does his bankruptcy. It is also a rule that no new partner can be introduced without the consent of the rest. There is also a peculiarity in the law of England as to the form of remedy—the rule being, that partners cannot sue each other in a court of law in respect of partnership transactions, but the only remedy is by a bill in Chancery. As against third parties, whatever may be the secret arrangements between themselves, the rule is, that any partner can bind the firm in all matters which are within the scope of the partnership, each being by the nature of the contract made the agent of all the rest for business purposes. Thus, any one may accept a bill in the name of the firm, provided such be one of the modes of doing business. It is, however, to be borne in mind, that the firm is only bound by one of the partners in those matters which are strictly within the proper business of the firm, which is an important qualification of the general power. Within the above limits, each partner can bind the rest of his copartners, however imprudent or foolish may be his act, for it is one of the implied conditions, that all have full confidence in each other. It follows from this principle, that the firm is liable for the dealings of each partner on its behalf within the scope of the partnership, that each is liable to the full extent for all the debts of the firm; in short, each is liable to his last shilling for the solvency of the firm. Hence, it is often of importance for a partner, on leaving the firm, to know how to terminate this liability. The rule is, that as regards all strangers, a notice in the *Gazette* is good notice: but as between the firm and those who have had dealings with it, the *Gazette* notice is of no use, unless it can be proved that the party had actual notice given to him—and hence a circular notice sent to customers announcing the fact of retirement, is the only course effectual.

The practice of individuals entering into large associations, now called joint-stock companies, which were originally only extended partnerships, has led to a separate code as to these being framed for the United Kingdom. See JOINT-STOCK COMPANIES. The practice of limiting the liability of partners or shareholders in joint-stock companies had of late years led to the belief, that a similar restriction might well be extended to ordinary partnerships, and accordingly a bill was introduced into parliament in 1864 to enable this to be done. By that bill—which, however, did not extend to Scotland—any person may place a specific sum of money in a firm, and become a partner, with liability limited to such sum. Such limited partner, however, is to refrain from all participation in the conduct of the business, otherwise he will become a general partner. Nor is his name to appear in the title of the firm. But for his own security and satisfaction, he is entitled to examine the books, so as to ascertain

the profits. In this kind of partnership, certain particulars are to be registered with the registrar of joint-stock companies, such as the name and place of business of each partner, describing whether he be a general or limited partner, the nature of the business, and the place of carrying it on, the name of the firm, the amount lent by each limited partner, and the time at which it is to be repaid. This kind of partnership may be renewed from time to time on fresh registration. Any clerk or servant may be allowed to share profits without incurring the liability of partner. The register-books of this class of partnerships are to be open to the registrar. These partnerships may sue in the name of the firm. This step may be considered at present in the light of an experiment, but it is expected to take firm root in modern business, as it enables capitalists and traders to unite on a more rational basis, and combine their several interests and capacities much more effectually than could be done heretofore.

In Scotland, the law of partnership, though in its essential features the same with the law of England, differs in one or two particulars. The partnership is treated as a distinct person in law, the partners being only its sureties or cautioners; and the consequence of this is, that in actions by or against the firm, the individual partners need not be named, though in practice one or two of them generally are named. Each partner may also sue the firm as if it were a distinct person; and the firm may be made bankrupt without any of the partners being sequestrated. See Paterson's *Comp. of E. & S. Law*, p. 214.

PARTRIDGE (*Perdix*), a genus of gallinaceous birds, of the family *Tetraonidae*, having a short, strong bill, naked at the base; the upper mandible convex, bent down at the tip; the wings and tail short, the tarsi as well as the toes naked, the tarsi not spurred.—The COMMON P., or GRAY P. (*P. cinerea*), is the most plentiful of all game-birds in Britain, and becomes increasingly plentiful as cultivation is extended, whilst the range of the moorfowl is restricted. It is not found in the Outer Hebrides. On the continent of Europe, it is abundant in almost all districts suitable to its habits, from Scandinavia to the Mediterranean, and is found also in the north of Africa, and in some parts of the west of Asia. It varies considerably in size; those found in rich lowlands being generally the largest, and about 12½ inches in entire length; whilst those which inhabit poorer and more upland districts are rather smaller. The female is rather smaller than the male. The upper parts of both are ash-gray, finely varied with brown and black; the male has a deep chestnut crescent-shaped spot on the breast, which is almost or altogether wanting in the female. The male has also the throat and sides of the face bright rust-colour, of which there is less in the female. A variety called the Mountain P. has the plumage brown. The P. is seldom found far from cultivated land. It feeds on grain and other seeds, insects and their larvae and pupæ, and the pupæ of ants are very generally the food sought at first for the young. It pairs early in spring, at which time fierce conflicts take place among the males. The nest is usually on the ground, among brushwood and long grass, or in fields of clover or corn, and generally contains from twelve to twenty eggs. The young run as soon as they are hatched. Both parents shew a very strong attachment to their young, and great courage in repelling assailants; they have also recourse, like many other birds, to stratagem, to draw off the most powerful and dangerous enemies, such as dogs, in another direction, fluttering close before them as if broken-winged, whilst the brood escape. Until the end of autumn, the parent birds and their brood

keep together in a covey; but in the season several coveys often unite into a flock, when it becomes much more difficult for the sportsman to approach them. The flight of the P. is strong and rapid for a short distance, but it does not seem to be capable of a long sustained flight. The eggs of partridge are often hatched, and the young birds reared, by duck-owners here; the chief requisite being plentiful supply of ants when the birds are very young. Partridges thus reared become very tame, but they seldom breed in the aviary.—The *Turnstone* (*P. P. rubra*, or *Colymbus rubra*, the genus or sub-genus *Colymbus* being distinguished by a rudimentary blunt spine at the base) is a native of the north of Europe and of the Channel Islands, and is now also plentiful in some parts of England, particularly Norfolk and Essex, two words it has been introduced. It is native here, then, the Common P., stranger on this coast and less easily approached by the sportsman, which it is also less esteemed for the table. The eggs here are of a reddish-brown color; the throat and cheeks white, bounded by a collar of black, with spots or black spots on the breast, and below without trace of black. The plumage is smooth.—Two other species, nearly allied to this, are found in some of the southern parts of Europe; one has a number of spines. The habits of all the species much resemble those of the Common Turnstone. The name P. is sometimes extended so as to include the species of *Oryzopsis* (see *VIRGINIAN WOOD*), and in North America it sometimes given to the *Turnstone*.

PARTURIDGE BERRY. See *GAVLHERIA*.

PARTURIDGE PIGEON (*Columba*), an Australian genus of *Columbidae*, approaching more than most of the pigeons in character and habits, to the true gallinaceous birds, and particularly to partridges. Their plumage is beautiful, and generally with a brown tinge and luster on the wings, which causes them to be sometimes called *Bronze-wings*. There are several species. They live mostly on the ground, and rise with a whirring sound like the pheasant, when disturbed. They are highly esteemed for the table.—*Streptopelia capensis*, known as another genus of *Columbidae*, bears the name of *PARTRIDGE DOVE* in the West Indies. It also feeds on the food chiefly on the ground, although it is often with wooded districts.

PARTURIDGE, in Artillery, were very large cannons formerly in use at siege and in defensive wars. They are mentioned in Frobert.

PARTURIDGE WOOD, a very pretty hard-wood from the West Indies and Brazil; it is usually of a yellow colour, in various shades from light to dark, the shade being changed in thin streaks; but in some dense sorts they are varied upon one another so as to resemble the feathers of the partridge, whence its name. One variety occurs in which the colors are remarkably bright, and it is consequently called *Partridge wood*. In Brazil, this beautiful wood is so plentiful that it is employed in ship-building, and it is said to be used in our navy-yard under the name of *Lightwood*, but this is incorrect; more woods are known as partridge, and several as *lightwood*. Among the Brazilian, it is called *Amorim*, and they describe four sorts—*Amorim de agua* (the Water Amorim), *Amorim de terra* (the Land Amorim), *Amorim de fogo* (the Fire Amorim), and *Amorim de vento* (the Wind Amorim). Its chief use in the navy is in the masts and spars. Partridge-wood, however, and other small matters for wood in country communities it. It is said to be killed by the leguminous tree (*Andira inermis*), which is found not only in the Brazil, but in other parts of South America and the West Indies.

PARTS OF SPEECH are the several kinds or classes into which the words of a language are divided. There is nothing in the outward form of words that would enable us to divide them into classes. The distinction lies in the office that the several words perform in a Sentence (q. v.). All words performing the same office in sentences belong to the same class. The essential parts of speech are the Noun, Adjective, Pronoun, Verb, Adverb, Preposition, Conjunction (see these several heads). The Articles (q. v.) are not distinct parts of speech, being essentially pronouns; and Interjections (q. v.) hardly belong to articulated speech. To name the class or part of speech to which each word of a sentence belongs, is called to parse it.

PARTURITION. See *MIDWINTER*.

PARTY, in Heraldry. See *PARTYING LINES*.

PARTY-WALL is the wall dividing two houses or tenements, and which is, in a certain sense, one and indivisible, though the property of two or more parties. The question as to what is the owner of any particular part of the party-wall, is solved by ascertaining who is the owner of the soil on which it is built. In the absence of evidence to the contrary, it is presumed that half of the soil belongs to the owner on one side, and the other half to the owner of the other side; and unless the wall has stood twenty years and upwards, each owner can do what he likes with his own half, and can pare it away if he likes. But in general, mutual interest prevents each party from resorting to his strict legal rights. A practice exists for one who builds a house adjoining the wall of a neighbor to pay for half the expense. In Scotland, a party building close to the wall of another's house, can compel the owner of the first house to give him half of the wall or gable, on paying half the expense; while in England there is no such compulsion. In Scotland, where the practice exists of building houses in flats (tying each upon the other, the law is not clearly settled, and requires to be cleared up as to what is the nature of the property or interest which each proprietor of a flat has in that part of the gable bounding his own flat. The better opinion is, that each is the entire owner of his half of the gable, the others having merely cross servitudes; and hence it follows, that if the flats on both sides of a gable belong to one owner, he can make a communication through the gable, provided he do not injure the chimney-flues of the lower flats, or the stability of the structure.

PÁRVATI (from the Sanscrit *parvata*, mountain, literally, mountain-born) is one of the names by which Durga, the consort of Siva, is usually called, she being the daughter of the mountain Himalaya.

PARVISE, a porch or open space in front of the door of a church.

PASCAGOULA, a river, and bay at its mouth, in Mississippi, U.S. The river, formed by the junction of the Leaf, the Chickahay, with numerous branches, drains the south-eastern portion of the state, and flows into Mississippi Sound through two mouths which form the bay. It is navigable 100 miles through a sandy region of pine-forests, supplying turpentine. The villages on the bay are summer resorts from Mobile and New Orleans; and on the shores at night are heard sounds like the *Solian* harp, supposed to be caused by some kind of shell-fish.

PASCAL, BLAISE, one of the most distinguished philosophers and scholars of the 17th c., was born at Clermont, in Auvergne, France, June 19, 1623. His father, Etienne Pascal, was president of the *Cours des Aides* at Clermont. His mother, Antoinette

Bezon, died while he was little beyond infancy. He had two sisters—the elder, Gilberte, Madame Perier, afterwards his biographer; the younger, Jacqueline, who became a nun of Port Royal, under the celebrated Mère Angelique, sister of Antoine Arnauld. From childhood, Blaise gave evidence of extraordinary abilities; and when he reached his eighth year, his father resigned his office at Clermont, and came to Paris, in order personally to direct the boy's education. For the purpose of concentrating all the boy's efforts upon languages, his father kept out of his reach all books treating the subject of mathematics, for which he had early evinced a decided taste; and it is recorded that by his own unaided speculations, drawing the diagrams with charcoal upon the floor, he made some progress in geometry. One account represents him as having thus mastered the first thirty-two propositions of the first book of Euclid's *Elements*—a statement which carries its own refutation with it. Thenceforward, he was permitted freely to follow the bent of his genius. In his sixteenth year, he produced a treatise on Conic Sections, which extorted the almost incredulous admiration of Descartes. In his nineteenth year, he invented a calculating-machine; and turning his attention to the novel questions as to the nature of fluids, which Torricelli's theories had raised, he produced two essays, which, although not published till after his death, have established his reputation as an experimental physicist. His father having accepted an office at Rouen, P. was there brought much into intercourse with a distinguished preacher, Abbé Guillebert, a member of the Jansenists, but a man of great eloquence, a great master of ascetic theology, from whom and from other members of the same rigid sect, as well as from the writings of Arnauld, St Cyran, and Nicole, P.'s mind received a deeply religious turn; and his health having suffered much from excessive study, he gave himself up in great measure to retirement and theological reading, and to the practice of asceticism. The death of his father, and his sister Jacqueline's withdrawal to Port Royal, confirmed these habits; and it is to this period that we owe his magnificent though unfinished *Pensées*, which have extorted the admiration even of his unbelieving, and therefore unsympathising critics. Having fully identified himself with the Jansenist party, he was induced (1655) to take up his residence at Port Royal, although not as a member of the body, where he resided till his death, entirely given up to prayer and practices of mortification, among which practices may be mentioned that of wearing an iron girdle, studded with sharp points, which he forced into his flesh whenever he felt himself assailed by sinful thoughts. In the controversy to which the condemnation of Arnauld by the Sorbonne (1655) gave rise, P. took a lively interest; and it was to this controversy that he contributed the memorable *Lettres Provinciales*, published under the pseudonym of Louis de Montalt. These famous Letters (eighteen in number, not reckoning the nineteenth, which is a fragment, and the twentieth, which is by Lemaistre), are written, as if to a provincial friend, on the absorbing controversial topic of the day. The first three are devoted to the vindication of Arnauld, and the demonstration of the identity of his doctrine with that of St Augustine. But it was to the later letters that the collection owed both its contemporary popularity and its abiding fame. In these P. addresses himself to the casuistry and to the directorial system of Arnauld's great antagonists, the Jesuits; and in a strain of humorous irony which has seldom been surpassed, he holds up to ridicule their imputed laxity of principle on the obligation of restitution, on simony, on probable opinions, on

directing the intention, on equivocation and mental reservation, &c. In all this, he professes to produce the authorities of their own authors. Of the extraordinary ability displayed in these celebrated Letters, no question can be entertained; but the Jesuits and their friends loudly complain of their unfairness, and represent them as in great part the work of a special pleader. The quotations, with the exception of those from Escobar, were confessedly supplied by P.'s friends. It is complained that many of the authors cited are not Jesuits at all; that many of the opinions ridiculed and reprobated as opinions of the Jesuit order, had been in reality formally repudiated and condemned in the Society; that many of the extracts are garbled and distorted; that it treats as though they had been designed for the pulpit and as manuals for teaching, works which in reality were but meant as private directions of the judgment of the confessor; and that in almost all cases, statements, facts, and circumstances are withheld, which would modify, if not entirely remove, their objectionable tendency. See JESUITS. To all which the enemies of the Jesuits reply by arguments intended thoroughly to vindicate Pascal. P. himself entertained no compunctious feeling for the production of these Letters, but even at the approach of death declared his full satisfaction with the work, such as it was. His later years were made very wretched by continued, or at least frequently recurring hypochondria, under the influence of which he suffered from very painful fantasies, which he was unable to control. His strength was completely worn out by these and other infirmities, and, prematurely old, he died at the early age of thirty-nine in Paris, in the year 1662. His *Pensées sur la Religion, et sur quelques autres Sujets*, being unfinished, were published with suppressions and modifications in 1669; but their full value was only learned from the complete edition which was published at the instance of M. Cousin (2 vols., 8vo, Paris, 1844). Of all his works, the *Lettres Provinciales* have been the most frequently reprinted. They were translated into Latin in the lifetime of P. by Nicole, under the pseudonym of a German professor, 'Wilhelm Wundt'; and an edition in four languages appeared at Cologne, in 1684.

PASCO, or CERRO DE PASCO, an important mining city in Peru, in the department of Juno, stands at an elevation of upwards of 13,000 feet above sea-level, 80 miles north-east of Lima in a direct line, but upwards of 130 miles by the winding mountain road. It consists of a collection of huts spread over an area that has been hollowed out and perforated in all directions by mines. The number of the inhabitants varies according to the state of the mines; being sometimes considerably more than 12,000, and often much less. The Cerro, or 'mountain knot,' of Pasco rises in Sacshuansta, 16,000 feet above the level of the sea. Coal is found in the vicinity.

PAS-DE-CALAIS (Fr. for Strait of Dover), a department in the north of France, bounded on the N. by the department of Nord and the Strait of Dover, and on the W. by the Strait of Dover and the English Channel. Area, 1,631,590 acres, of which 883,300 acres are cultivated, and 236,707 in meadows. Pop. (1862) 724,338. The surface is level, with the exception of a ridge of hills running from the south-east to the north-west, ending in Gris-nez Cape (q. v.), and forming the water-shed between the North Sea and the English Channel. The rivers, which are of no considerable length, are the Scarpe and Lys in the basin of the North Sea and the Authie and Canche belonging to the basin

PASERO—PASQUE FLOWER.

of the English Channel. The rivers are navigable within the department, and are connected by canals. The coast line is 50 miles in length, and the shores are in certain parts low and sandy; while the several miles on either side of Havre, still similar to those at Dover from the sea. The climate is mild, but exceedingly insalubrious. The soil is very fertile—all the usual cereal and leguminous crops are produced in abundance—and the country is very productive both as regards agriculture and manufactures. Fishing is actively carried on, on the coast, particularly in the neighbourhood of Boulogne. Out of an indifferent quality is raised, the excellent species of the department are worked, and considerable quantities of wool are sent. The industrial establishments are numerous and important, as iron-forges, glass-works, potteries, tanneries, and numerous black-smiths, and mills and factories of various kinds. Boulogne and Calais are the principal harbours. There are six arrondissements—Arras, Bethune, St. Omer, St. Pol, Boulogne, and Montreuil. The capital is Arras.

PASERO, See GOST.

PASIKWALK, a town of Prussia, in the government of Berlin, 65 miles west-north-west of the city of that name, on the Oder. It contains two churches, two hospitals, and several woollen cloth and leather factories, and carries on an active general trade. Pop. exclusive of military, 6500.

PASHA, or PACHA, a title used in the Ottoman empire, and applied to governors of provinces, of military and naval commanders of high rank. The name is said to be derived from two Persian words—*pas*, *lord* or *support*, and *shah*, *rule*—and signifies 'the support of the ruler.' The title was limited to the early period of the Ottoman empire to the princes of the blood, but was subsequently extended to the grand-vizier, the members of the divan, the eunuchs, captain-pasas, the higher judges, and other civil and military authorities. The distinctive badge of a pasha is a horse's tail, waving from the end of a staff, crossed with a gilt ball; in war, this badge is always carried before him when he goes abroad, and is at other times planted in front of his tent. The three grades of pashas are distinguished by the number of the horse-tails on their standards; three of the highest rank are pashas of three tails, and include, in general, the highest functionaries, civil and military. All pashas of this class have the title of *emir*; and the grand-vizier is, *par excellence*, a pasha of three tails. The pashas of two tails are the governors of provinces, who generally are called by the humble title 'pasha.' The lowest rank of pasha is the pasha of one tail, the *reis-pasha*, or lowest class of provincial governors, are of this rank. The pasha of a province has authority over the military force, the revenues, and the administration of justice. His authority was formerly absolute, but recently a check was imposed on him by the appointment of *kadis* *generals*. The pasha is in his own person the *military leader* and administrator of justice for the province under his charge, and holds office during the pleasure of the sultan—a most precarious tenure, as the sultan can at any moment, in the exercise of his despotic power, exile, imprison, or put him to death; and this has frequently been accomplished where his pasha's power has excited the apprehensions, or his wealth the avarice of his royal master.

PASKEVITCH, IVAN FEODOROVICH, Count of Russia, Prince of Warsaw, and a Russian field-marshal, was born at Poltava, May 10, 1782. He was descended from a Polish family, and was at first a page to the Czar Paul, but entered the army,

and served in the campaign in 1805, which was ended by the arrest of Austria; and then against the Turks. He took a prominent part in the campaign of 1812, and several times defeated the French under Eugene, Ney, and St. Cyr; he was also present at Leipzig and the conflicts under the walls of Paris. In 1825 he was appointed commander-in-chief against the Persians, whom he completely defeated, conquering Persian Armenia, taking Erivan, and ending the war by the peace of Turkamanchi (q. v.), a peace exceedingly favourable to Russia. In recompense for these services, he was created Count of Erivan, and received a grant of 1,000,000 rubles (2105,000). In 1828 and 1829, he made two campaigns against the Turks in Asia, signified by the taking of Kars, Erzerum, and other important provinces, and terminated by the treaty of Adrianople in 1829. In 1831, P., now a field-marshal, was appointed viceroy of Poland, put an end to the revolt within three months after his appointment, and reconstructed the administration on the basis of a complete incorporation with Russia. Such was the vigour and severity of his rule, that the eventful year 1848 passed over without any attempt at revolution. When Russian intervention in Hungary had been resolved upon, P., though now 67 years of age, marched into that country at the head of 200,000 men, and, after a junction with the Austrians, defeated the Hungarians in several battles, and by mere force of numbers crushed out the last spark of insurrection. The 50th anniversary of his military service was celebrated at Warsaw, in 1855, with the utmost rejoicings, and on this occasion the sovereigns of Austria and Prussia conferred on him the rank of field-marshal in their respective armies. In 1856, he unwillingly took the command of the Russian army on the Danube; but fortune, which had hitherto invariably smiled upon him, deserted him at Silistria; and after undergoing a succession of sanguinary reverses, and being himself grievously wounded, he withdrew his army, and resigning the command, retired to Warsaw, where he fell into a state of profound melancholy, and died January 29, 1856.

PASPALUM, a genus of grasses, with spikes either solitary or variously grouped, one-flowered spikelets, and awnless palea. The species are numerous, natives of warm climates.—*P. aridum* is cultivated as a cereal in India, where it is called Koda. See MILLER. It will grow in very barren soils, and delights in a dry loose soil. *P. aridum* is cultivated in like manner in the west of Africa, where it is called Fandi (q. v.) or Fandou. Other species are valuable as fodder-grasses. *P. purpureum* is a very important fodder-grass in the coast districts of Peru, during the dry months of February and March. *P. dolens*, also a Peruvian species, has been introduced into France; but is apt to be injured by frosts, and seldom ripens its seeds in the neighbourhood of Paris.

PASQUE FLOWER (*Pulsatilla*), a genus of plants of the natural order *Primulaceae*, by many botanists still included in *Anemone*, the chief distinctive characteristic being the long feathery awns of the fruit. The species are perennial, silky, herbaceous plants, with doubly pinnatifid or doubly trifid leaves, and a single one-flowered scape. They are narcotic, acid, and poisonous. The Common P. (*Pulsatilla vulgaris* or *Anemone pulsatilla*) is a native of many parts of Europe, and of chalky pastures in several parts of England. It has widely bell-shaped bluish-purple flowers. Another species, *P. or A. pratensis*, a native of the continent of Europe, not of Britain, has smaller and more perfectly

ball-shaped blackish-purple flowers.—These plants emit, when bruised, a pungent smell; and contain, as their principal constituent, a peculiar pungent essential oil, which, in combination with *Anemonic Acid*, forms an acrid and very inflammable substance called *Anemone*, or *Pulsatilla Camphor*, and

Pasque Flower (*Anemone pulsatilla*).

is sometimes used in medicine. *Pulsatilla* is a favourite medicine of the homœopaths. *Easter Eggs* are coloured purple in some places by the petals of the pasque flower.—More acrid than any of the species just named is *Pulsatilla patens*, which occasionally even blisters the skin.

PASQUINADE, an anonymous or pseudonymous publication of small size, sometimes printed, sometimes only posted up or circulated in manuscript, and having for its object the defamation of a character, or at least the turning of a person to ridicule. The name is derived from *Pasquino*, a tailor remarkable for his wit and sarcastic humour, who lived in Rome towards the close of the 16th c., and attracted many to his shop by his sharp and lively sayings. Some time after his death, a mutilated fragment of an ancient statue, considered to represent Menelaus supporting the dead body of Patroclus, was dug up opposite his shop, and placed at the end of the Braschi Palace, near the Piazza Navoni. It was named after the defunct tailor, and thus the practice originated of affixing to it placards containing satires and jests relative to the affairs of the day—the pope and the cardinals being favourite victims of the invisible satirists. It was, and still continues to be, the only outlet which the Roman has for his opinions and feelings. One or two may be quoted as specimens of the mordant style of the Pasquin statue. 'Great sums,' said the satirist one day, in an epigram addressed to Pope Paul III., 'were formerly given to poets for singing; how much will you give me, O Paul, to be silent?'—On the marriage of a young Roman called Cesare to a girl called Roma, the statue gave the following advice: 'Cave, Cesare, ne tua Roma republica fiat.' Next day the rival statue of Marforio, in the Capitol, replied: 'Cæsar imperat; to which Pasquin with exquisite malice retorted: 'Ergo coronabitur.'

PA'SSAGE, WEST, a seaport town upon the western shore of the estuary of the river Lee, in the

county of Cork, Ireland, which has risen into importance chiefly as a watering-place, and as the shipping-port and marine suburb of the city of Cork, from which it is distant, by the Cork and Passage Railway, about 6 miles. As the river above P. is not navigable for ships above 400 or 500 tons burden, ships of higher tonnage discharge their cargoes at Passage. It is also a ship-building station. Pop. in 1861, 2287; of whom 1879 were Catholics; 375, Protestants of the Established Church, and the rest of other religious denominations.—There is another small town of the same name, EAST PASSAGE, near the mouth of the Suir, in the county of Waterford, Ireland.

PASSAGLIA, CARLO, a Roman Catholic theologian of great eminence, who has attained much notoriety in connection with the recent movement for the unity of Italy, is a native of the duchy of Lucca, where he was born May 2, 1812. His origin is very humble, and he entered extremely young as a scholar of the Jesuit Society, of which he was enrolled a member in the year 1827. Having obtained much distinction in the schools of the order, and having, as is usual with its members, taught for some time in the lower schools, he completed his theological studies in the Roman College, and was appointed Professor of Canon Law, and eventually of Dogmatical Theology. His reputation for learning stood in the very first rank of Roman Catholic theology, and his lectures were exceedingly admired for their eloquence and erudition, but were considered in some respects too diffuse for the class of pupils who frequented his school. During the temporary withdrawal of the Jesuits from Rome in 1848—1851, P. with some of his brethren came to England, where he taught theology to the young brethren of his order, and on the re-establishment of the Jesuits in the Roman College, he resumed possession of his chair. During the discussions which preceded the definition of the doctrine of the Immaculate Conception of the blessed Virgin Mary (q. v.), P. prepared an elaborate treatise as well on the doctrine as on the history of that question, which was published at the cost of the Roman government. Soon afterwards, however, the dissatisfaction which was felt at the unsuitable character and method of his lectures, led to some remonstrance on the part of the authorities of the order, and ultimately to his resignation of the professorship of theology. Still, however, he continued a member of the Society; and the pope, who felt a warm friendship for him, established in the Roman university a special chair of Philosophy for him, of which he took possession, but which he did not long retain. In the end of 1858, or early in 1859, he left the Society of the Jesuits, and soon afterwards he began to take an active part in the discussions as to the temporal power of the pope; and with a view to an accommodation of the difficulties in which it was involved, he undertook a voluntary mission to Turin, which, however, led to no results. Having fallen under suspicion in Rome, and his house having been invaded by a domiciliary visit of the police, he withdrew from Rome, and settled at Turin, where he established a journal, entitled *Il Mediatore*, which in 1864 was still in course of publication. He was elected a member of the Turin parliament, in which career, however, his success hitherto has fallen far short of his reputation.

P.'s principal works are the treatise on the Immaculate Conception already referred to (4 vols. 4to); a treatise (Latin) on the Primacy of St Peter (8vo, 1850); a scholastic treatise entitled *Commentarius Theologicus de Partitione Divinae Voluntatis* (8vo, Rome, 1851); an apology for the cause of Italian unity, entitled *Pro Causa Italica; ad*

PASSATIC—PASSENGER PIGEON.

PASSENGER PIGEON (Florence, 1861), in which he recommends the students to make poems with the same, several essays on various subjects, and quite mostly a history to Rome & l'air de Rome (Italian).

PASSATIC, a river of New Jersey, U. S., rises in Morris County, and after a circuitous south-westerly course of 80 miles, empties into Newark Bay. It is navigable for ships for a short distance; and its fall of 72 feet at Paterson furnishes water-power to numerous factories, and are an attraction to tourists.

PASSAMAQUIDDY BAY opens east of the Bay of Fundy, between Maine and New Brunswick, North America. It is 12 miles long by 8 wide, and shut in by a cluster of islands so as to form an excellent harbour. It receives the St. Croix, Digby, and other rivers, and forms the harbour of the fishing towns of Musquod. The bay abounds in fish, and has tides of 25 feet.

PASSANT, a heraldic term used to express the attitude of an animal in a walking position, with

its head straight before him (fig. 1); fig. 2 represents the attitude, *Passant gardant*; fig. 3, *Passant regardant*.

PASSA DOWITZ, a well-built town of European Turkey, in the province of Konia, 5 miles south of the Danube, and 16 miles east of Semendria. Its streets are wide and unpaved, its houses detached, and surrounded with palisades. Pop. 5000. The town is chiefly noteworthy for the treaty which was signed here by Prince Eugene and the grand vizir, July 21, 1719. By this treaty, which put an end to the war undertaken by the Turks against Vienna in 1714 for the conquest of the Morea, a truce of 25 years was established, and the Banat of Temeswar, the western portion of Wallachia and Serbia, the town and territory of Belgrade, and a part of Bosnia, were secured to the House of Austria.

PASSAU, a picturesque, fortified, frontier town of Bavaria, at the confluence of the Inn and the Danube, 80 miles east-north-east of Munich. It consists of P. Proper (triangular in shape, and occupying an eminence on the tongue of land between the right bank of the Danube and the left bank of the Inn), and the suburbs, Innstadt, on the right bank of the Inn; Anger and Fort Oberhaus, between the Danube and the Inn; and Innstadt, on the left bank of the Inn. At the point of junction, the Inn is both wider and has a lower course than the Danube, the former being 324 feet, while the latter is only 600 feet wide. A wooden bridge over the Inn, resting on eight piers of granite, connects Innstadt with P., and the Danube is crossed by a fine bridge resting on seven piers, also of granite. Fort Oberhaus, on the left bank of the Danube, stands on steep, wooded cliffs at an elevation of upwards of 400 feet, and commands the passage both of the Inn and Danube, leaving which the town is further defended by the castle of Niederhaus, and by ten detached forts. The appearance of P., situated at the confluence of two great rivers, and rising like an amphitheatre to the great beautiful spot of the Danube, is strikingly picturesque and picturesque. Among the chief buildings are the cathedral, the bishop's palace, the

post-office, where the treaty of P. was signed in 1661; the Jesuits' College, a large building now used as a school; and the Church of St. Michael's. In the cathedral square (Domplatz) is a bronze statue of King Maximilian Joseph, a recent erection. P. contains also numerous picture-galleries, collections of antiquities, and benevolent and charitable institutions. The women of P. are famous for their beauty. Pop. 11,300.

The natural advantages of this site, in a military point of view, were appreciated at an early period by the Romans, who erected a strong camp here, garrisoned it with Batavian troops, and from this circumstance named it *Batava Castra*. P. was long the see of a bishopric founded in the 7th c., but secularized in 1805. By the treaty of P., signed here in 1552 by the emperor Charles V. on the one side, and the Protestant princes of Germany on the other, public recognition of the Lutheran faith among the institutions of the empire was granted. The cathedral of P. and great part of the town were consumed by fire in 1682.

PASSEUAILLE and **PASSEPIED**, two old French dances, the music of the former being in 3, the latter in 4 time. Compositions under these names, suggestive of the dances in question, though not meant for dancing, occur among the 'Saites,' or collections of short pieces for the harpsichord or claviered by Sebastian Bach and Handel.

PASSENGER PIGEON (*Colaptes migratorius*), a species of pigeon, native of North America, and particularly interesting from the myriads of which its flocks are often composed. The genus to which it belongs has, like the turtle doves, a bill more slender than the ordinary pigeons, notched, and with a tumid fleshy covering above at the base; the head is small in proportion to the body, the legs are short and strong, the feet naked, the tail either rounded or wedge shaped, the wings long and pointed. The P. P., generally known in North America as the Wild Pigeon, has a long wedge-shaped tail; the whole length being from 15 to 17 inches, of which the tail occupies nearly

Passenger Pigeon (*Colaptes migratorius*).

one half. It is a beautiful bird, of very graceful form and finely-coloured plumage. The plumage of the female is duller than that of the male. The P. P. is found in almost all parts of North America, from the Gulf of Mexico to the Arctic regions. D

is not, properly speaking, a bird of passage; its migrations being apparently altogether consequent on the failure of the supplies of food in one locality, and the necessity of seeking it in another, and not connected with the breeding season or the season of the year. Its power of flight is very great, and it is supposed to be able to sustain a long flight at the rate of sixty miles an hour. Passenger pigeons have been killed in the neighbourhood of New York, with their crops full of rice, which they must have collected in the fields of Carolina or Georgia not many hours before. It is not, therefore, very wonderful that wanderers of this species should occasionally appear in Britain and in other regions far from their native abode. The nest of the P. P. in the American forests generally consists of a few dry twigs placed in a fork of the branches of a tree, and containing two eggs, sometimes only one egg. They breed two or three times in a season. In the backwoods, vast numbers of pigeons building in one breeding-place, many nests, sometimes 100 or more, are often to be seen in one tree. These great breeding-places extend over a vast tract of forest, sometimes not less than forty miles in length; but in the more cultivated parts of the United States the P. P. builds singly and not in communities. The numbers of birds forming the communities of the western forests surpass calculation. Flocks of them are to be seen flying at a great height in dense columns, eight or ten miles long; and there is reason to suppose, from the rapidity of their flight, and the number of hours taken by a column in passing a particular spot, that in some of their great migrations the column, a mile broad, is more than 150 miles long. Their roosting-places, as well as their breeding-places, are of prodigious magnitude. The graphic descriptions of Wilson and Audubon are too long to be quoted; but there is perhaps nothing of the kind so wonderful in relation to any species of bird. The noise of wings and of cooing voices is as loud as thunder, and is heard at the distance of miles. It drowns the report of guns. The multitudes which settle on trees, break down great branches by their weight, so that it is dangerous to pass beneath. They crowd together, alighting one upon another, till they form solid masses like hogsheads, and great numbers are killed when the branches break. The inhabitants of the neighbouring country assemble, shoot them, knock them down with poles, stifle them by means of pots of burning sulphur, cut down trees in order to bring them in great numbers to the ground, eat them, salt them, and bring their hogs to fatten on them. Wolves, foxes, lynxes, cougars, bears, raccoons, opossums, polecats, eagles, hawks, and vultures all congregate to share the spoil. The flesh of the P. P. is of a dark colour, but tolerably pleasant. That of young birds is much esteemed. The nestlings are in general extremely fat, and are sometimes melted down for the sake of their fat alone. The food of the P. P. consists chiefly of beech-mast and acorns, but it readily eats almost any kind of nut, berry, or seed.

PASSENGERS BY LAND AND SEA. The law affecting passengers by land, in a carriage or public conveyance, may be stated as follows: The owners of the railway or other carriage do not contract to carry the passenger with perfect safety; they do not warrant that he will not be injured; but they merely contract to carry him without any negligence on their part. Hence, in case of accident, though it is not strictly correct in point of law to assume that the accident arose from some negligence of the carrier, unless there is evidence to support it, this presumption is in point of fact always made,

110

and it lies on the carrier to shew that it was from no fault or negligence on his part that the accident happened. As questions of negligence must almost always be decided by a jury, and their prepossessions are against admitting the idea that accidents arise from any cause except negligence of the carrier—which is a wholesome doctrine—it seldom ever happens that a railway or public company attempt to dispute their responsibility on that ground. The rule is that a railway company is responsible for the negligence of any of their servants; and hence, in case of accidents, all passengers injured, and in case of death, the parent, husband, wife, or children of the deceased passenger, invariably make a claim of compensation, except when the accident was caused by the passenger's own personal negligence. For while a carrier is bound to use due care to carry the passenger with safety, it is equally true that the passenger is at the same time bound to take ordinary care of himself, and not act in a rash or foolish way, so as to lead to an accident. Before railways and canals were in use, it was sometimes doubted whether it was not the duty of carriers by coach to carry all persons who presented themselves and offered to pay their fare; but this notion is exploded, and even railway companies are not bound to carry everybody who comes, but merely to give reasonable accommodation to the ordinary number, otherwise their liability would be enormous on particular occasions where crowds assemble. Their interest is usually a sufficient inducement on such occasions to provide the accommodation required. A passenger has a right to carry along with him Luggage (q. v.).

In the case of passengers by sea, a peculiar code has been constructed, owing to the peculiarity of their situation. The fundamental rule of the common law is the same as on land carriage—that the carrier by sea does not engage to carry with absolute safety, but merely to omit nothing in his power, and to use due care. The legislature, however, has passed statutes to regulate the duties of carriers by sea, the latest being 18 and 19 Vict. c. 119. The act, however, only applies to voyages from the United Kingdom to places out of Europe, and not to the Mediterranean Sea. Payment of the passage money must be made before commencing the voyage, and the owners are not bound to forward steerage passengers by the very ship contracted for, if an equally eligible ship be offered, provided, however, that families are not to be separated. If the ship is disabled on the voyage, the owners are bound to repair the ship in six weeks, or send on the passengers. If the passengers exceed 300, a medical practitioner must be on board, and the provisions must be according to a certain scale of diet. The Emigration Commissioners require to inspect emigrant ships, and to give a certificate as to fitness. As to passenger steamers in this country, a certificate is required from the Board of Trade, specifying the voyage and number of passengers allowed to be carried.

PASSERINE BIRDS. See INSECTORES.

PASSING-BELL, a bell tolled during the death agony of a dying person, at the moment of the soul's 'passing' from earth to its eternal abode. Its use in Catholic countries is to invite the hearers to join in the prayers which are ordered 'for the dying in their hour of agony,' and which the priest with his attendants recite in the death chamber. See BELL.

PASSING-NOTES, in Music. In passing from one chord to another, an intervening note, not belonging to either chord, may be used to assist the progression. Such a note is called a passing-note or

side of the stem, as the notes D and F in the upper part of the following example:

PASSION'S CROSS, a cross of the form on which our Saviour suffered, with a long stem and a short transverse arm; thus:

Passion Cross.

It is of occasional occurrence as a heraldic charge, though less frequent than many other symbols of arms. A cross, armed, when divided on three sides by the stem, which have been said by heralds to represent the virtues of Faith, Hope, and Charity, is called a *Three Calvary*.

PASSIONFLOWER (*Passiflora*), a genus of plants almost exclusively natives of the warm parts of America, and belonging to the natural order *Passifloraceae*, an order of sanguineous plants, of which more than 200 species are known, mostly twining, having tendrils which spring from the axils of the leaves, herbaceous or half shrubby, natives of tropical and subtropical countries, but also Asia and Africa. The leaves of the *Passiflora* are alternate, simple, and variously lobed. The flowers are generally hermaphrodite, with a

Passionflower (*Passiflora corollata*).

coloured calyx, generally of five segments; the segments of the corolla equal in number to those of the calyx or absent, and several rows of filamentous processes springing from within the tube of the corolla; the ovary free, generally elevated on a long stalk, unlobed; three thick styles with united stigmas; ovules numerous. The fruit is either fleshy or capsular. In the *Passionflower* it is fleshy. This genus has received its name from the first Spanish settlers in America, imagining that they saw in its flowers a representation of our Lord's passion; the filamentous process being taken to represent the crown of

thorns, the pad-shaped styles the nails in the cross, and the five anthers the marks of the wounds. The species are mostly half shrubby evergreen climbers, of rapid growth, and most of them have lobed leaves, with from two to seven lobes. The flowers of many are large and beautiful, in which account they are often cultivated in botanica. Some of the species are also cultivated in tropical countries for their fruit, particularly those of which the fruit is known by the name *Granadilla* (q.v.). The fruit of *P. whitei* is also somewhat acid and of a pleasant flavour, and one flavoured with it are delicious. The fruit is about two inches long, and an inch and a half in diameter, of a livid purple colour, with orange pulp. The fruit of some species of *P.*, however, is not only unpalatable, but fatal, and the roots, leaves, and flowers of some, as well as of other *Passifloraceae*, have medicinal properties, narcotic, emmenagogue, antispasmodic, febrifugal, &c. *P. rubra* is called *Hutchinson's leadenism in Jamaica*, because a tincture of the flowers is used as a substitute for leadenism. The most hardy species of *P.* is the fruit *P. (P. corollata)*, which grows well enough in some parts of France, and even in the south of England. Where the climate is suitable, passionflowers form an admirable covering for arbours and trellises.

PASSIONISTS, a religious congregation of priests of the Roman Catholic Church, the object of whose institute, indicated by their name, is to preach 'Jesus Christ and his crucifixion.' The founder, Paul Francis, surnamed Paul of the Cross, was born in 1604 at Ovada, in the diocese of Aquis in the kingdom of Savoy. Having commenced his career as a hermit, he formed the design of enlisting others in the missionary life, and being ordained priest in 1737, he associated himself with ten others, and obtained for his plan the approbation of successive popes, together with the consent of the Cellan Hill, at Rome, which still forms the mother-house of the congregation. The special object of the institute was to instil into men's minds by preaching, by example, and by devotional practices, a sense of the mercy and love of God as manifested in the passion of Christ. Hence the cross appears everywhere as their emblem, in their churches, in their halls, and in the courts and public places of their monasteries. A large crucifix, moreover, forms part of their very striking costume. They go bareheaded, and practice many other personal austerities, rising at midnight to recite the canonical hours in the church; and their ministerial work consists chiefly in holding what are called 'missions,' wherever they are invited by the local clergy, in which sermons on the passion of Christ, on sin, and on repentance, together with the hearing of confessions, hold the principal places. Paul of the Cross died in 1775. For a time his congregation remained in obscurity; but it has risen into much notice within the last 30 years, now known having been founded in England, Ireland, Belgium, America, and Australia.

PASSION-WEEK, the name commonly given in England to the week immediately preceding Easter, and otherwise called *Holy Week* (q.v.). But by the proper rubrical usage, *Passion Week* is that which precedes Holy Week, commencing on *Passion Sunday*, the fifth Sunday of Lent. In the Roman calendar, the whole of the last fortnight of Lent is known by the name of *Passion-time*, and all the services of that time differ in many respects from those, not some of the year, but even of the rest of Lent. The verse *Gloria Patri* is disavantaged both in the mass and in the Breviary, and all pictures,

crucifixes, statues, and other sacred representations are veiled during the whole of Passion-tide.

PASSIVE TITLE, in the Law of Scotland, is the liability of an heir, or one who represents and interferes with the estate of a deceased person, to pay all the debts of the deceased. It was considered that so great an opportunity of fraud in secreting the goods of a deceased person existed, that the heir was presumed to be liable for all the debts of the deceased, unless he took good care to give up an inventory, and so shew what property there was. The barbarous doctrine of holding an heir universally liable has latterly been much restricted; but the explanation is entirely technical.

PASSOVER (*Pesach, Pascha*), the first and greatest of the three annual feasts (*Regalim*) instituted by Moses, at which it was incumbent upon every male Israelite to make a pilgrimage to the house of the Lord. It was celebrated on the anniversary of the Exodus from Egypt—i.e., on the 14th day of Nisan, otherwise called Abib, the period of the first full moon in the spring—and lasted eight days. In commemoration of the incidents connected with the great event of the liberation of the people, it was ordained that unleavened bread only should be eaten during this festive period, whence it also bore the name *Chag hamazzoth* (Feast of Unleavened Bread); and, further, that a lamb one year old, and free from all blemish, roasted whole, together with bitter herbs, should form the meal in every house on the eve of the feast. Prayers and thanksgivings, all with a reference to the redemption from bondage, accompanied the repast, at which the members of the family or families who had joined in the purchase of the lamb had to appear in travelling garb. At a later period, a certain number of cups of red wine were superadded to this meal, to which, as its special ceremonies and the order of its benedictions were fixed, the name *Seder* (arrangement) was given. The name P. was more strictly limited to the first day, in which the paschal lamb was entirely consumed, the reserving of any part of it to the next day being expressly forbidden (Ex. xii. 10); and the name Feast of Unleavened Bread belonged rather to the remaining days, on which other animal food was eaten; but the names were often used indiscriminately.

The P. is generally regarded by Christian theologians as at once a sacrifice and a sacrament, and in the former character as an eminent type of the sacrifice of Christ. The death of Christ at the very time of the P. is regarded as corroborative of this view, which is indeed plainly adopted in certain passages of the New Testament, as John xix. 36, and 1 Cor. v. 7, in which last place our Saviour is designated 'Christ our Passover.' The P. is regarded as typical of Christ, in its connection with the deliverance of Israel from the bondage of Egypt, held to typify our salvation from the bondage of sin; in its being a sacrifice, and that of a lamb without blemish—the perfection of the paschal lamb, as of the other sacrificial victims, being supposed to signify the perfection of the great sacrifice; and in many other minor particulars, of which one is that referred to in John xix. 36, that no bone of the paschal lamb was to be broken.

The Paschal meal, as at present celebrated among the Jews, has more the character of a hallowed family-feast, with reference, however, to the great national event. The greater part of those—it may be added here—who live out of the Holy Land celebrate it on the two first evenings, as, owing to the uncertainty prevalent at one time with respect to the fixing of the new moon by the Sanhedrim at

Jerusalem, it was ordained that the 'Exiles' should celebrate all their festivals—except the Day of Atonement—on two successive days, a law still in force among the orthodox. The regulations of the 'lamb for each house,' the travelling garb, &c., are abrogated, but many further symbolical tokens have been superadded; reminiscences, as it were, both of the liberation from Egypt, and the subsequent downfall of the sanctuary and empire. The order of prayers and songs to be recited on these evenings has also received many additions, and even mediæval German songs have crept in, as supposed to contain a symbolical reference to the ultimate fate of Israel. See *HAGGADA* (*shel Pesach*), *FESTIVALS, EASTER, LORD'S SUPPER*.

PASSPORT, a warrant of protection and permission to travel, granted by the proper authority, to persons moving from place to place. Every independent state has the right to exclude whom it pleases from its territory, and may require that all strangers entering it be furnished with properly authenticated documents, shewing who they are, and for what purpose they are visiting the country. Passports are sometimes issued by the ministers and consuls of the country which the traveller intends to visit, which cannot, however, be done without the consent or connivance of the state of which the holder of the instrument is a subject; they properly proceed from the authorities of the state to which the traveller belongs, and ought to bear the *visa* or countersignature of the minister or consul of the country which he is about to visit. In many European states no one is allowed to go abroad without a passport from his government authorising him to leave the country—a provision used as a means of detaining persons charged with crime. In some states, passports are even required by the natives to enable them to go from place to place in their own country. The regulations of different states have varied much regarding the use of passports; and of late years the general tendency has been to relax the stringency of the regulations connected with them. Since the facilities of travelling have so greatly increased, it seems to have become the prevalent opinion that the passport system tends to obstruct the free intercourse that is desirable between citizens of different countries; while it is ineffectual to prevent the entrance of dangerous or suspicious characters, who can obtain passports on false pretences, or make their way in without them. Within the United Kingdom no passports are required; but for a British subject travelling in many parts of the continent, they are requisite. Till of late years, the greater part of British subjects travelling abroad used to be furnished with passports from the ministers or consuls of the countries which they purposed to visit; the lord provost of Edinburgh was also in the way of issuing passports to Scotchmen. Of late years the passport most used by British subjects is that of the British Secretary of State for Foreign Affairs, which is now granted to any British subject on application of a banking company in the United Kingdom, or on the recommendation of the chief magistrate of any corporate town in the United Kingdom, or of any magistrate or justice of the peace, physician, surgeon, solicitor, notary, or minister of religion, who shall certify that the applicant is the person that he professes to be. If the applicant be a naturalised British subject, he must be known to the Foreign Secretary, or recommended to him by some person known to him, and his certificate of naturalisation must be forwarded to the Foreign Office. A Foreign Office passport must, as a general rule, be countersigned by the minister or consul of each country which the

holder comes to visit. The passport is good for five, the visa only for a year. Since January 1861, British subjects have been admitted from Holland like France, and allowed to travel in that country without passport, on merely declaring their nationality; but that exemption does not seem to apply when France is entered from another side than the Channel. In Holland, Holland, Norway, Sweden, Italy, and, according to the most recent regulations, also in Prussia, passports are not asked for. In Austria, the passport has to be shown and counter-signed by the police authorities at the frontier; but except in the garrison towns of Vienna, it is hardly ever asked for in the interior. In many of the smaller German states, any person remaining in a town above 24 hours must send his passport to the police-office, and obtain a permission to remain. Till lately, throughout the greater part of Europe, a traveller was liable to be called on to produce his passport, not only at every frontier town, but at every garrison town through which he passed, the ceremony of counter-signature by the police being repeated each time. This was more especially the case in Italy, where the visas were stamped with perpetual delays, annoyances, and demands on the traveller's purse. Foreign Office passports cannot be sent to British subjects residing abroad, who must apply for a passport to the nearest British mission or consulate.

In time of war, passports or safe-conducts are granted by the supreme authority on the spot—i. e., the officer in command—to insure safety to the soldier when passing from spot to spot, or while engaged in the performance of some act specified in and permitted by the passport. Passports may be granted for people as well as individuals; and, in time of war, the passport of a ship is the formal voucher of its neutral character. It purports to be a regulation on the part of the government of a state to allow the vessel to pass freely with her company, passengers, goods, and merchandise, without hindrance, seizure, or molestation, as being owned by citizens or subjects of such state.

PASSY, a town of France, in the department of Seine, a suburb of Paris, and included within the walls of that city. See **PARIS**.

PASTA, *GIUSEPPE* (*Junior*), one of the most distinguished opera singers of modern times, was born near Milan in Italy in 1798, and received her musical education partly at Como, under the direction of the cathedral there, and partly in the conservatory at Milan. After 1811 she appeared at various theatres of the second rank in Northern Italy, and obtained a respectable success, but did not give her particular indication of possessing more than average ability. Her first great triumph was achieved at Vienna in 1822. The year following she was engaged at the Paris Italian Opera, where her singing created great admiration. From her moment she laboured incessantly to reach the ideal perfection she had set before her mind. From 1823 to 1826 was the period of her most splendid triumphs, which were won principally in London and Paris. Vienna, where she accepted an engagement in 1822, witnessed the last. Some time afterwards she withdrew from the stage, and purchased a villa on the banks of Lake Como, where, and at Milan, she has ever since resided. For her last days had a magnificent voice, which easily passed from clear shrill soprano notes to the lowest contralto tones. In addition she had a fine dramatic energy and stateliness of manner, that suited lofty and imposing characters. Her principal roles were *Maria*, *Desdemona*, *Semiramide*, *La Sonnambula*; the opera of this name was written for her by Bellini, and *Gratia* in *Rossini's Giulio*.

PASTE, a term applied to various compositions in which there is just sufficient moisture to soften without lignifying the mass.

Common or adhesive paste is made by mixing selected flour with cold water in the proportion of about two pounds to a gallon. The water is added by degrees, and well stirred in, so as to prevent lumps. About an ounce of powdered alum is sometimes added to increase its adhesiveness, and for shoemakers and bookbinders about an ounce and a half of finely-powdered rosin is substituted for the alum, which thickens it much and renders it much more tenacious. When the ingredients are thoroughly mixed, they are heated, great care being taken to stir them thoroughly whilst boiling to prevent burning. This paste is used for a great variety of purposes, more especially by paper-hangers, bill stickers, bookbinders, paste-board makers, &c. An adhesive paste, called *Chinese Paste*, is made by reducing to perfect dryness bullock's blood. It is then powdered and mixed with one tenth of its weight of finely-powdered quicklime. When used, it is mixed with water sufficient to form a paste, which is a strong cement for pottery, wood, stone, &c.

Fruit Paste is made by taking the juice of any fruit and dissolving in it an ounce to a pint of gum-arabic, or gum-mastic, which many prefer; then evaporate by a gentle heat until the liquid is as thick as syrup, and add to every pound of it a pound of finely-powdered refined sugar; continue the heat, and stir it until the sugar and juice are thoroughly incorporated, after which it is poured out on a marble slab slightly oiled. When cooled, it may be formed into lozenges for use. An imitation of this is made very generally by mixing three parts of citric acid, twenty-four parts of gum, and forty-eight parts of refined sugar, and dissolving the whole in water, and gently heating it to insure complete solution and mixture. It is then variously coloured and flavoured with any of the fruit essences. This paste is often sold under the name of *jupules*, which were formerly lozenges of fruit paste prepared from the juice of the jupule fruit, *Staphis jupule*.

Polishing Pastes vary according to the materials upon which they are to be employed. For brass, the best kind is a mixture of two parts of soft soap with four parts of rotten-stone in very fine powder. Another sort is eight parts of fine rotten-stone powder, two parts of oxalic acid powdered, three parts olive oil, and enough of turpentine to make them into a paste. For iron, a mixture of emery powder and lard is used; and for pewter a mixture of finely-powdered both brick and soft soap. For wood, a paste called *furniture paste* is made by adding spirit of turpentine to beeswax sufficient to form it into a soft paste, which is rubbed on thinly with a brush and woollen rag, and afterwards polished with a dry woollen cloth and soft brush.

Staving pastes are very numerous, but the best of all is soap. The best of all is the true Naples soap (see **SOAP**), but it is often mixed with other ingredients according to the fancy of the vendor. For other applications of the word *Paste*, see **GUM** (**IMITATION**), and **MACARONI**.

PASTEL, chalk mixed with other materials and various colours, and formed into pencils or crayons (q. v.).

PASTEL. See **WUAD**.

PASTILE, **PASTIL**, or **PASTILLE**, a diminutive of *paste*. This term was originally applied to lozenges as little portions of confectionary paste, but it has been of late chiefly confined to a mixture of odorous materials, as in the case of the *flamingo* 313

pastiles, which are burned either as incense or as a means of diffusing an agreeable odour. They are composed of charcoal powder, with such aromatic gums as benzoin, labdanum, &c.; and powders of sweet-scented woods and barks, as sandal-wood, cinnamon, and especially cascarilla barks. Essential oils are also added, and the whole are worked into a paste with a little gum-mucilage, and formed into small sharp-pointed cones about an inch and a half high, and half an inch broad at the base. When perfectly dry, they are used by lighting at the point, and as they burn down an agreeable odour is given out with the smoke. Very tasteful vessels, called *pastille burners*, usually of porcelain, are made for using them. Another kind of *pastille*, usually in the form of a small pill covered with gold or silver leaf, is used for perfuming the breath; it is made of the same kind of ingredients, excepting the charcoal.

PASTO, a town of the United States of Colombia, on a high plateau between two ridges of the Andes, 148 miles north-east of Quito. Height above sea-level upwards of 8500 feet. It is in the direct route from the Popayan Pass to Quito. Pop. about 7000.

PASTOR, a genus of birds of the Starling family (*Sturnidae*), differing from starlings in the compressed and slightly-curved bill. In habits, as in characters, they are very nearly allied to starlings. The name *P.* is supposed to be derived from their

Rose-coloured Pastor (*Pastor roseus*).

being frequently seen with flocks of sheep. The only European species is the ROSE-COLOURED P., or Rose-coloured Ouzel (*P. roseus*), a rare visitant of Britain and of the northern parts of Europe, and more common in the north of Africa, Syria, and India than in any part of Europe.

PASTORAL LETTER, a letter addressed either at certain stated times, or on the occurrence of some notable occasion, by a 'pastor,' but especially by a bishop to the clergy under his jurisdiction, to the laity of his flock, or to both. Of the former class, in the Church of Rome, are the so-called *Lenten Mandates*, or *Instructions*, issued before the commencement of Lent, and making known the regulations enacted for the observance of the *Lenten fast*, the dispensations granted, and the devotions and other pious works prescribed. Such also are the letters issued by a bishop on many of the chief festivals of the year. It is usual for bishops, besides their stated letters, to address to their clergy or people instructions suited to any particular emergency which may arise, and sometimes to take occasion from the issuing of the stated pastoral letter to offer instruction on some topic of importance which may engage public attention at the time, on some prevalent abuse or

scandal, or some apprehended danger to the faith or to morals. To this class belong many of the remains of the early fathers, especially in the Western Church. In some countries the government, as formerly in Austria, claimed a right to exercise a censorship over the pastoral letters to be issued by the bishops. This right, however, is regarded by churchmen as a usurpation, and although submitted to, is admitted only under protest. See *PLACETUM REGIUM*, *FEBRONIANISM*.

PASTORAL POETRY is that kind of poetry which professes to delineate the scenery, sentiment, and incidents of shepherd-life. It is highly probable that the first attempts to give a rhythmic expression to human feeling were to some extent of this character. Men were originally shepherds, and their festal songs and hymns would derive at least substance and imagery from their primitive occupations; but as a distinct branch of poetic art, pastoral poetry was not cultivated till a comparatively late period; for although critics are fond of pointing to the lives of the Hebrew patriarchs, and to the story of Ruth, as specimens of the antiquity of the pastoral in the East, yet, as these profess to be history, and not fiction, they can be instanced only to prove that the *material* for this kind of poetry existed from the earliest ages. In point of fact, it was only after innocence and simplicity had passed away, or were thought to have passed away, from real life, that men began, half from fancy, and half from memory, to paint the manners of the past as artless, and the lives of their ancestors as constantly happy. It was thus the *Brass Age* that made the *Golden*. The oldest specimens of the classic pastoral are the *Idylls* of Theocritus (q. v.), which appeared about 275 B. C.—long after Greece had produced her masterpieces in epic narrative, in the war ode, and almost all other kinds of the lyric, in tragedy, comedy, history, philosophy, and rhetoric. Theocritus was imitated by Bion and Moschus, whose pastorals approximate in form to the drama. Among the Latins, the refined and courtly Virgil, in the reign of Augustus, wrote his *Bucolica* or *Ecloques*, on the model of his Greek predecessors; but, however beautiful and melodious the verses of these urban writers are, we cannot suppose for a moment that the rude shepherds and shepherdesses of Italy or Sicily indulged in such refined sentiments, or spent their time so poetically as there they are made to do. Virgil, we may rest assured, is as far from giving a genuine picture of pastoral life in his verse, as any modern poet who prates of Chloë and Phyllis.

During the middle ages, pastoral poetry in this artistic, and therefore conventional sense of the term, was almost unknown; but with the first glimpse of reviving classicism, the pastoral reappears. The earliest specimens are afforded by Boccaccio (q. v.), about the first modern Italian who studied Greek. It is to the countrymen of Boccaccio that we owe the creation of the pastoral drama, of which there is no trace in ancient literature. The *Favola di Orfeo* of Politian (q. v.), performed at the court of Mantua in 1483, is the first dramatic poem which pretends to represent the sentiments, incidents, and forms of pastoral life. Critics have forgotten this work when they make Tansillo the inventor of the *favola pastorale*, or *boscareccia*, on account of his *I due Pellegrini* (1539), or Agostino Beccari, whose pastoral comedy, *Il Sacrificio*, was played at Ferrara in 1554. However, it is true that the extraordinary popularity of Beccari's piece originated a crowd of *favole boscareccie*, the finest and most poetical of which is the *Aminta* of Tasso, represented at the court of Ferrara in 1572. A later, but hardly less famous production

in the *Pastor Fido* of Guarini (q.v.), published at Venice in 1689; and in the 18th c. the good shepherd (q.v.) received for a moment the interest in the general and picturesque, but unreal, towards clergymen. In Spain, during the first part of the 16th c., a abundantly florid. The first who wrote pastoral dialogue was Juan del Eslava (q.v. *ibid.*), he was followed by Garcilaso de la Vega, and others. During the reign of the Emperor Charles V., one may say that Spanish imaginative literature was almost wholly of a bucolic character; but in Spain, as elsewhere, it took largely the form of pseudo-romance (see *Proverbs*) rather than of poetry, deriving its inspiration from the *Idylls* and *Élégies* of Longus, the *Idylls* of Theocritus, and from the bucolic strains of the Mantuan verse. English, however, can boast of Spenser's *Shepherd's Calendar*, which is at least full of charming poetry, and is appropriately dedicated to Sir Philip Sidney, whose pastoral romance of *Arcadia* contains in point of beauty nearly all other fictions of that class. The *Idylls* of Spenser (Spenser's *Idylls* as you like it) in the list of pastoral discourses; but its right to be so classified is by no means clear, although we may admit that it betrays the influence of the pastoral poetry and romance that had just ceased to be the main strain of the scholarly genius of Europe. A source of influence is visible in the writings of other Englishmen, dramatists, as, for example, in the *Idylls* of Shakespeare (q.v.). In France, pastoral poetry is perhaps older than in any of the western nations. The comedy of Alain de Lulabelle, entitled *Le Roman d'Arrou* (The Hunchback of Arrou), entitled *Le Jeu de Robin et Marion* (and which seems to be in the *Idylls* of Spenser), belongs to the middle of the 13th century. During the next years in the latter half of the 16th c., the poem was turned in pastoral mood. In the following century, it continued for some time to be popular, or rather, let us say, fashionable. Even the great Racine alleviated the cares of office with the composition of *La Grande Pastorale*; but here, too, the poem soon gave way to the prose-romance, which was hardly less unreal, and far more so.

Perhaps the best pastoral, ancient or modern, is the *Good Shepherd* of Allan Ramsay (q.v.), published in 1725. 'It is,' says Mr. Campbell (Campbell's *Cyclopaedia of English Literature*, vol. 1, p. 601), 'a genuine picture of Scottish life, but of life passed in simple rural employments, apart from the guile and fever of large towns, and reflecting only the pure and unadorned emotions of our nature. The affected sentimentalism and feigned distresses of the *Coridon* and *Delia* find no place in Ramsay's clear and sunny pages. He drew his shepherds from the life, showed them in scenes which he actually saw, and made them speak the language which he every day heard—the free idiomatic speech of his native vales.' The English contemporaries, Pope, Ambrose Philips, Gay, and others, who form the 'Angustan,' or Queen Jane school of poets, also admitted themselves to the composition of pastoral poetry; but though there is much fine description in the verses, they are, in general, purely conventional performances, in imitation of the classic poets, who, as we have said, did not themselves imitate nature. From this source, however, must be excepted the six pastorals of Gay, entitled the *Shepherd's Week*, which are full of honest country humour, and contain charming pictures of English country life. Since the early part of the 18th c., however, pastoral poetry, strictly so called, has ceased to be cultivated in England and almost everywhere else. In the pages of Wordsworth, who lived all his days among the

Cumbrian shepherds, we indeed find many English glances of pastoral life, as it presented itself to the poet's and tender imagination of that great poet of nature, and few direct imitations of pastoral manners. Germany imitated abundantly the French and Italian models during the greater part of the 18th century. The last and best of the German series is the *Kreis und Elise* of Goethe's youth. The general impression appears to be that the age of pastoral poetry has passed away forever, and that Denmark and China will never respond to it.

PASTORAL STAFF. Sometimes also, although not properly, called *Crosier* (q.v.) (Lat. *crucis pastoralis*), one of the insignia of the episcopal office, sometimes also borne by an abbot. It is a tall staff of metal, or of wood, ornamented with metal, having, at least in the Western Church, the head curved in the form of a shepherd's crook, as a symbol of the pastoral office. The head of the pastoral staff of an archbishop, instead of the crook, has a double cross, from which its name of *crucis* is derived. In the Greek Church the staff is much shorter, and the head is either a plain Greek cross of the form of the letter Tau, or it is a double-headed crook, which sometimes appears in the shape of the symbol, τ . It is difficult to determine the time at which the pastoral staff first came into use. The first distinct allusion to it is in St. Augustine's commentary on the 12th psalm. Gregory of Tours, in his life of St. Martin, mentions the pastoral staff of St. Severinus, who was bishop of Cologne in the end of the 4th century. From an early time, the pastoral staff was connected with the actual possession of the jurisdiction which it symbolises. The giving of it was one of the ceremonies of investiture; its withdrawal was part of the form of deprivation; its voluntary abandonment accompanied the act of resignation; its being broken was the most solemn form of degradation. So also the veiling of the crook of an abbot's pastoral staff, during the episcopal visitation, signified the temporary suspension of his authority to that of the bishop. An abbot being required to carry his pastoral staff with the crook turned inward, showed that his authority was purely domestic. The pope alone does not use a pastoral staff. In the later medieval period the pastoral was often extremely costly, and, referring to the relaxation of the times, it was said: 'that formerly the church had wooden pastoral staves and golden bishops, but that now the staves are of gold and the bishops of wood.' The workmanship was sometimes extremely beautiful. We annex as a specimen of the highest art the pastoral staff of William of Wykeham, now in New College, Oxford. This is a sample of the Norman pastoral staff. The Saxons were by no means so tall. The Irish pastoral staff is of a type quite peculiar, and some of the sculptured specimens preserved in the British Museum, at the Royal Irish Academy, and elsewhere, are very interesting as illustrating the ecclesiastical costume of the period.

PASTORAL THEOLOGY. That branch of theological science which regards the duties and obligations of pastors in relation to the care of souls. It comprises two parts; first, that which treats of

Pastoral Staff.

the obligations of the pastors themselves, and which is therefore designed for the training and preparation of the candidates for the pastoral office. The other part of pastoral theology, which might perhaps better be called Popular Theology, comprises the objective teaching which is to be employed in the instruction and direction of the flock committed to the pastor's charge. This branch of theology has long formed a leading portion of the training of candidates in the Evangelical Churches of France and Germany; and a valuable manual for Catholic studies has recently appeared in Vienna, *Lehrbuch der Katholischen Pastoral*, von Dr A. Kerschhammer, 8vo, Wien. 1863.

PASTRY, articles of food in which the chief part consists of a paste made of flour. This would of course apply to bread, but it has been limited by custom to such lighter articles as are made by the pastry-cook, and chiefly to those in which the paste is made to assume a light flaky character by the addition of butter, &c., and by the mode of working it up. The commonest kind is made of a dough of flour and water, into which butter or lard is worked by hand, in the proportion of six ounces to the pound. The finest kind is usually termed *puff paste*, and considerable skill is required to make it well, for it depends, next to the goodness of the materials, upon lightness of hand in kneading the ingredients together. These ingredients consist of fine wheaten flour and butter in the proportion of four ounces of butter to a pound of flour, with cold water just sufficient to make a good stiff elastic dough; this is rolled out with a *rolling-pin*, and double the previous quantity of butter is then spread over it. It is then rolled up and lightly kneaded, so as to work the butter in thoroughly. Coolness is very important in making pastry; a marble slab is therefore most desirable for making it upon. The thinner it is rolled out before the butter is then spread the better, because when it is put in the oven the laminae which have been formed by folding or rolling up the butter with the dough, separate by the disengagement of the watery vapour, and the thinner and lighter the flakes are the better is the puff paste. Another kind is called *short paste*; in this the flour is made warm, and the butter or lard used is often melted, and a little sugar and an egg or two are added. This, when baked, has none of the flaky character of puff paste, but it is better adapted for meat and some other kinds of pies which require to be baked without a dish. Game pies, with elaborately-decorated crusts, are made of this pastry.

PASTURAGE, in English Law called Common of Pasture, is classed among rights of common or profits *à prendre*, and is the right of one who is not the owner of land to put his sheep or cattle on such land to feed there. In Scotland it is called a servitude of pasturage. In both countries the right can be established by prescription, in England of thirty years, and in Scotland of forty years. Where the parties entitled to pasturage dispute as to their respective proportions of cattle, the suit to redress the matter is called in Scotland an action of 'sowing and rowning.'

PASTURES (Lat. *pasco*, to feed) are fields or tracts of land devoted to the feeding of oxen, sheep, and other herbivorous animals, which eat the grass and other herbage as it grows. Grass is grown sometimes in the rotation with grain and other crops, when it remains on the ground for one or more years, is frequently mown during the first summer, and grazed afterwards, but is again ploughed up to be succeeded usually by oats or wheat. For such purposes, rye-grass, red, white, yellow, and alsike clovers, are used either alone or mixed in

varying proportions. On the uplands of Great Britain, wherever from any cause grain crops cannot profitably be grown, and throughout many of the richest plains and valleys, especially of England and Ireland, there are thousands of acres of land which have been under grass from time immemorial. Such permanent pastures are estimated to occupy fully 14,000,000 acres in England, nearly 8,000,000 in Scotland, and about 9,000,000 in Ireland. Sometimes they have been self-sown, occasionally they have been laid down with care, seldom are they as highly cultivated and liberally managed as they should be. The best of them are used for feeding heavy bullocks; those of somewhat poorer description are often grazed by dairy stock; whilst the down or upland pastures are especially profitable for sheep. It has now become a common practice, and is every year becoming more and more general, to give additional food of various kinds to animals fed on pastures. Even cattle grazing on the richest pastures are supplied with linseed cake, &c., to hasten the process of fattening, and to improve their quality; roots are given to sheep when fattening for the market, and hay to those which are to be kept as stock; whilst when oats or beans are cheap, many sheep-farmers find it advantageous to give them even to the hardy stock of exposed hill-pastures. All pastures are much improved by thorough drainage. The application of farmyard dung, soil, lime, and almost every sort of top-dressing is beneficial. Irrigation is sometimes profitable, and in some other countries is far more common and far more requisite than in Britain. Rich pastures on which oxen are fed are injured by sheep, which reject the coarsest grass, and pick out the finest; but a few horses turned into them during the autumn or winter help to consume the coarser tufts. The coarsest and rankest grass may once or twice a year be cut over by the scythe; and either made into rough hay, or if left on the ground, the cattle, when it has partially dried, will readily eat it up. A dressing of lime and salt scattered over the rougher parts of the fields in autumn will sweeten the herbage, and induce the stock to eat it down regularly. Moss, which is a great pest in many pastures, may be got rid of by penning sheep, well fed with swedes, cake, or corn, regularly over the field; or by harrowing the surface in several different directions during January or February, applying then a top-dressing of soil or dung, and in March or April sowing some clover or other seeds, which will be firmed down by the bush harrow, clod-crusher, or heavy roller. The droppings of the cattle ought to be broken up and scattered over the ground. Rich pastures intended for the fattening of cattle ought not to be used during winter, but allowed to become luxuriant before the cattle are turned upon them in spring. Very lean animals, whether oxen or sheep, cannot with advantage be at once placed on very rich pasture, but must be gradually fitted for it. In some of the hill districts of Scotland, devoted to sheep-farming, increased productiveness has resulted from breaking up portions of the pasture, and after two or three crops have been taken, laying them down as pastures again. All good pastures produce a very mixed herbage, not consisting merely of one kind of grass, but of several or many, with clovers and other plants. Different species of Meadow-grass (*Poa*), Fescue (*Festuca*), Foxtail (*Alopecurus*), Oat-grass (*Avena*), Cock's-foot (*Dactylis glomerata*), Rye-grass (*Lolium*), Hair-grass (*Aira*), Vernal-grass (*Anthoxanthum*), and Timothy or Cat's-tail (*Phleum*), are among the most common grasses of British pastures. Yarrow (*Achillea millefolium*) is very abundant in some

PATAGONIA

pasture, and is sometimes sown with grass, clover, &c., in land reserved for permanent pasture. Different kinds of grass are adapted to different soils and situations. The presence of rushes is very indicative of the want of drainage. Thistles and docks are injurious, and are to be anticipated as much as possible. Some of the plants naturally abundant on high hill-pastures, as *Nardus stricta* and *Juncus bryonia*, are very unattractive; and the substitution of others in their stead, is one of the benefits derived from the breaking up of such lands.

PATAGONIA, the most southern country of South America, bounded on the N. by the Argentine Republic, and the Rio Negro, which separates it from the Campos (q. v.); on the N.W. by the Chilean territories; on the W. by the Pacific; on the E. by the Strait of Magellan, which separates it from Terra del Fuego; and on the E. by the Atlantic. It lies in lat. 35°–55° S.; and in long. 60° 40'–75° 40' W. Length upwards of 1000 miles, greatest breadth about 450 miles; area about 250,000 square miles; pop. estimated at 125,000. In this estimate is comprised P., must be one of the most sparsely-peopled regions of the globe. The coast of the Atlantic is much broken by extensive bays and inlets, some of which, however, are of much importance or advantage, in a commercial point of view. Along the eastern coast, and stretching from 42° S. to the Strait of Magellan, are numerous islands, with precipitous shores, belonging apparently to the system of the Cordillera. The principal islands are Chiloé, the Chonos Archipelago (q. v.), Wellington Island, the Archipelago of Madre de Dios, Quena Adulá's Archipelago, and Desolation Island. These islands—which, together with several peninsulas, form a coast almost as ragged as that of Norway—are mountainous; but in none of them, except in Desolation Island, do the mountains rise to the surface.

Physical Aspects.—The country of P. divides itself into two regions, very unequal in size and very different in character. These are Eastern and Western P., which are divided by the great mountain range of the Andes. Western P., comprising this range, the coast districts, and the islands, is rugged and mountainous. Opposite the island of Chiloé are two active volcanoes, one of which, Minchinmavie, is 9900 feet high. The slope of the country from the Andes to the Pacific is so steep, and the strip of shore so narrow, that the largest river of this district has its origin only about 13 miles from its mouth on the coast. In the island of Chiloé, to the north of Western P., the mean temperature of winter is about 40°, that of summer rather above 50°, while at Port Famine, in the extreme south of this region, and 800 miles south of the latitude than Chiloé, the mean temperature is not much lower, being in winter about 27°, and in summer about 50°. This unusually small difference in the mean temperature of the extremes of Western P., which extends over about 14° of lat., is due to the great dampness of the atmosphere all along the coast. The prevailing winds of this region blow from the west; and, heavily recharged with the moisture they have drawn from the immense waters of the Pacific Ocean, they strike against the Andes, are thoroughly condensed by the cold high mountains, and fall in rains that are almost perpetual from Chiloé to the Strait of Magellan. South of 47° S. lat., hardly a day passes without a fall of rain, snow, or sleet. This continual dampness has produced forests of almost tropical luxuriance. A kind of deer wanders on the east side of the mountains; pumas and water-fowl are met with; and, along the coast, seals, otters, sea-elephants, fish, and shell-fish are found.

Eastern P., often called the plains, comprises by far the larger portion of P., and extends outward from the Andes to the Atlantic. Its surface has not yet been thoroughly explored, and is described only in the most general terms. According to all accounts written previously to the present year (1854), Eastern P., from its northern to its southern limits, is an immense, stony, shingly waste, generally level, but gradually rising in tiered steps from the Atlantic to the Cordillera. The elevation of the highest of these terraces is about 3000 feet. The surface is covered with stones and pebbles, mixed with earth of a whitish colour, overlying great masses of porphyry, and strewn with immense boulders. Thorny brushwood, tufts of coarse brown grass, and toward the west, basaltic ridges, break the dead level of the dreary landscape. The soil is strongly impregnated with saltpetre. Salt lakes of every variety of extent and level abound. Many of these lakes are surrounded by a brilliant snow-white crust; the waters of some of them are cold in summer and hot in winter, while in others the waters are poisonous. Extending along the south coast for several hundred miles, there is a great deposit of tertiary strata, underlying a stratum of a white pumaceous substance, a tenth part of which is marine infusoria. Sea-shells are scattered everywhere across the country, and soil is everywhere abundant, from which circumstances it has been inferred that this tract was once a sea-bottom. The air of Eastern P. is generally dry and hot, deriving no moisture from the prevailing west winds, which pass over the plains after having been drained by the Andes. Hurricanes, however, cutting and frigid, sweep over the plains with great fury, stripping the hides from the roofs of the *ranchos* or huts; and paralysing the inhabitants with cold and with fear. The above account, though in general correct, must be supplemented as well as modified by a few facts as to the surface from one who recently lived for three years in P. and its vicinity. According to M. Guinnard, the country along the banks of the Rio Negro is for the most part mountainous, and is intersected by deep ravines; but it is not as has hitherto been believed, completely sterile. For, on the contrary, the scarped banks of the river are sometimes abundantly fertile. The same traveller further estimates that one-third of the entire area of this country—which has hitherto been described as barren—is of great fertility, especially the regions on the east coast and on the Strait of Magellan to the south. Along the eastern base of the Andes also, the great tract of territory called *Los Serranos* is astonishingly pectoreous and fertile. Here great forests abound, to which the Indians retire for shelter from the freezing winds of winter. There are also deep valleys furrowed by mountain torrents; and numerous lakes, the haunts of wild-ducks and other water-fowl which would delight the European sportsman, but which are never disturbed by the Indians, and are almost as tame as town-yard fowls. Except pasture, Eastern P. has no productions. However fertile the soil in some places may be, it is nowhere cultivated. The Indians live upon the produce of the chase alone, and seem to desire no better sustenance. The principal rivers are the Rio Negro (q. v.), the Chupat, which flows through a good soil, producing excellent pasture and good fire-wood; and the Santa Cruz, which flows through a barren district, in a valley from one to five miles wide, and 1400 feet below the level of the plains. All these rivers rise in the Andes; the Chupat flows east, and the others south-east. Herds of horses are reared, dogs abound, and in the more favoured regions, cattle are bred; pumas and felines are met with as well as condors, hawks

partridges, and water-fowl in Los Serranos. But by far the most important animals are the guanaco (wild llama), the nandou (Patagonian ostrich), and the gama, a kind of deer.

Inhabitants.—The Patagonians have been hitherto described only in the most general terms, and in many cases very inaccurately. Little was known of their appearance, habits, and employments. Recent information, however, enables us definitively to class the Patagonian monster of the early voyagers with Gulliver's giants. The tallest of the tribes are composed of men who, on an average, are nearly six feet in height; while in other tribes the average height is an inch or two less. There is reason to believe, however, that instances of unusual height are as rare in P. as in Europe. The peculiar costume of the Patagonians, which in most instances consists of a long mantle of hide, drooping with unbroken outline from their shoulders almost to the ground, gives them the appearance of extraordinary height. Many of the tribes also are large in body, while they have comparatively short extremities; and these, when seen on horseback, covered with their long mantles, seem almost gigantic in stature. Their colour is a reddish brown. Their shoulders are large, and well thrown back; the chest is well expanded; the head large, the forehead open and prominent; the mouth large; the eyes black, and generally large; the nose frequently hooked, long, and thin, though among some tribes it is, as a rule, broad at the nostrils; the ears are large, and elongated by the heavy ornaments of their own manufacture which they wear in them, and which are so large that they often rest on the shoulders. The hair, generally black, coarse, and lank, is sometimes rolled together on the top of the head. Their houses, called *roukaks*, are formed of three rows of stakes driven into the ground. The middle row is higher than the others, and the three rows are tied together with strings of hide, and so kept in their place. This frail framework is covered with hides which reach the ground on all sides, and are fastened to it by small stakes of bone. At nightfall, guanaco hides are spread on the ground within the tents, and the men and women laying aside their mantle, their only garment, and which sometimes serves as a blanket, go to sleep under the same roof and in the same apartment. Bathing in cold water every morning, throughout the whole year, is a custom to which men, women, and children conform; and although the morning bath may not free them from vermin—a national characteristic—yet it has the effect of preventing disease, and of enabling them the more easily to endure the severities of winter. The men, when out on the hunt, shew wonderful courage and adroitness; when not so engaged, they live in perfect idleness. They are incredibly greedy and voracious. They deck their heads, and ornament them into the perfection of ugliness, greasing their hair with the grease of the horse. They pull out the hair of the eyebrows and beard, and paint their bodies with black, red, and other colours. The Patagonians are nomads; some of the tribes, however, as the *Puelches*, are nomads from choice, not from necessity, for their district or headquarters is abundantly fertile. The more important tribes are nine in number; and each tribe is led and governed by a cacique, whose power extends also to numerous sub-tribes. Each family and each man, however, is entirely free, and can remain attached to a certain tribe or separate from it at pleasure. The Patagonians form themselves into these communities for the purpose of self-defence. Wars are so frequent that security is found only in union. The chiefs are considered as the fathers, the leaders, and the rulers of the tribe; and are selected

chiefly on account of their bravery in battle. The more powerful tribes frequently make raids upon settlements, and carry off great numbers of horses and cattle. They subsist upon the flesh of horses, nandous, gamas, and guanacos; the flesh they eat is generally raw. Their choice morsels are the liver, the lungs, and the raw kidneys, which they prefer to eat dished in the warm blood of the animal, or in curdled milk seasoned with salt. Roots and fishes are also eaten, but raw flesh is the staple. They are hospitable among themselves, though bitterly hostile to Christians. Their only manufactures are mantles of guanaco hide, and saddles, bridles, stirrups, and lassos. The lassos and the articles of harness are chiefly plaited, and evince wonderful ingenuity and nicety of execution. The mantles are made for the most part by a tribe called the *Techeuelches*. They are mainly made by women, who first in a rude and primitive manner tan the leather, then put the hides together, and sew them with the small sinews of the animal itself. Afterwards the men rub them with a stone for the purpose of suppling them and flattening the seams, and then ornament them with capricious designs in red and black paint. The Indians obtain a few cattle and horses in exchange for these mantles, which are no less prized by neighbouring tribes than they are by the Hispano-Americans. Clothed in one of them, the natives expose themselves to the most intense cold without receiving any injury.

The religion of the Patagonians is dualistic. They believe in two gods or superior beings—the God of Good and the God of Evil; or, in their own language, *Vita Ouëndrou*—the Great Man, and *Honacowou* or *Gualetchou*—the Cause of Evils. The former they consider the creator of all things, and they believe that he sends the sun to them as his representative, as much to examine what takes place among them, as to warm their bodies and renew the brief spring verdure. The moon is another representative, whose office it is to watch them and give them light. Believing that they themselves require a great deal of 'watching,' they further believe that every country on the globe has its own sun and moon, or special watchers. They have no idols. Their faith is transmitted from father to son, and its observances are strictly attended to. They are full of strange superstitions. They dread the north and the south, believing that from the south come evil spirits, who take possession of the souls of the dying, and bear them off to the north. They consider that the best means of ensuring a long life is to go to sleep with the head lying either to the east or to the west. They also believe that all natural phenomena have their causes in their own conduct, and that all misfortunes are sent as punishments due to moral delinquencies. Thus, the fearful tempests that sweep over their plains inspire them with the greatest dread. During the prevalence of the hurricane, they crouch together in their huts; fear makes them inactive, and they do not stir from their grovelling position even to cover themselves with the hides which the tempest strips from their huts. The Patagonian never eats or drinks without turning to the sun, and throwing down before him a scrap of meat or a few drops of water, and using a form of invocation. This form of invocation is not fixed, but it hardly ever varies, and is to the following effect: 'O Father, Great Man, king of this earth! give me favour, dear friend, day by day; good food, good drink, good sleep; I am poor myself, are you hungry? Here is a poor scrap; eat if you wish.' The Patagonians observe two great religious fêtes—one in summer, in honour of the Benevolent Deity; and another in autumn, in honour of the God

at Tell. On the occasion of these rites, the Indians assemble in hundreds, dressed in the most enormous manner, with their hair curly, grizzled, and their bodies freshly painted. On such occasions, it is customary to wear whatever ornaments they may have obtained either in war or by stealth from civilized men; and a Patagonian chief may be seen wearing slippers, his mantle of hide the skirt of the European, or pacing his step in a pair of pantaloons. The Patagonians are much given to gambling and to drinking. They make interesting beverages from the *l-coca* which they find in their woods, and they obtain liquor from the Mexican-Americans, in exchange for manillas.—*Trois Ans d'Enfouage chez les Patagons*, par A. Guillard.

PĀTALA (*does not fall*), is Hindu Mythology, the name of those interior regions which have seven, or, according to some, eight divisions, each containing downwards ten thousand *yojanas*, or miles. The soil of these regions, as the *Pāṇini* defines, is severally white, black, purple, yellow, sandy, stony, and of gold; they are embellished with magnificent palaces, in which dwell enormous Daityas, Daityas, Yakshas, and great ashyokas, decorated with brilliant jewels, and happy in the enjoyment of delicious viands and strong wines. There are in these regions beautiful rivers, and streams and lakes; where the lotus flows, and the skies are resplendent with the *hukita*'s rays. They are, in short, so delightful, that the great Narada, after his return from them to heaven, declared among the celestials that P. was much more delightful than Indra's heaven. Professor Wilson, in his *Vishnu Purāṇa*, says 'that there is a very curious description of Pātala in any of the Purāṇas; that the most circumstantial are those of the *Viṣṇu* and *Bhagavata Purāṇas*; and that the *Mahābhārata* and these two *Purāṇas* assign different names to the *Draupadi*, *Daityas*, and *Nagas*. . . . The regions of the Pātala and their inhabitants are about the subjects of profane than of sacred belief, in consequence of the frequent intercourse between mortal heroes and the serpent-raids. A considerable portion of the *Prithak-kāṇḍa* consists of adventures and events in this subterranean world.' For various regions of a different description, see *SATYAKA*.

PATANGJALI is the name of two celebrated authors of ancient India, who are generally looked upon as the same personage, but apparently for no other reason than that they bear the same name. One is the author of the system of philosophy called *Yoga* (q. v.), the other the great critic of *Kātyāyana* (q. v.) and *Pāṇini* (q. v.). Of the former, nothing is known beyond his work—for which see the article *YOGA*. The few historical facts relating to the latter, as at present ascertained, may be gathered from his great work, the *Mahābhāṣya*, or 'the great commentary.' The name of his mother was *Ushāhā*; his birthplace was Gonarda, situated in the east of India, and he resided temporarily in Kashmir, where his work was especially patronised. From circumstantial evidence, Professor Goldstücker has, however, proved that he wrote between 140 and 150 A. D. *Pāṇini, his Place in Sanskrit Literature*, p. 125, ff.). The *Mahābhāṣya* of P. is not a full commentary on *Pāṇini*, but, with a few exceptions, only a commentary on the *Vārtikas*, or official remarks of *Kātyāyana* on *Pāṇini*. 'Its method is analogous to that of other classical commentaries; it establishes, usually by repetition, the correct reading of the text, in explaining every doubtful or doubtful word, in showing the connection of the principal parts of the sentence, and in adding such observations as may be required for a

latter understanding of the author.' Not frequently *Patanjali* also attaches his own original remarks to the explanations of *Kātyāyana*, often in support of the views of the latter, but not seldom, too, in order to refute his criticisms, and to defend *Pāṇini*; while, again, at other times, he completes the statement of one of them by his own additional rules. P. being the third of the grammatical triad of India (see *PĀṆINI*), and his work, therefore, having the advantage of profiting by the scholarship of his predecessors, he is looked upon as a permanent authority in all matters relating to classical Sanskrit grammar; and very justly so, for as to learning, industry, and conscientiousness, there is no grammatical author of India who can be held superior to him. The *Mahābhāṣya* has been commented upon by *Kātyāyana* in a work called the *Uddhaya-Nidāna*; and the latter has been annotated by *Nagabhūta*, in a work called the *Uddhaya-pratipadika*. No much of these three latter works as relates to the first chapter of P.' first book of *Pāṇini*, together with the *Vārtikas* connected with them, has been edited at Mirapore, 1856, by the late Dr J. H. Ballantyne, who also gave a valuable literal translation of the first forty pages of the text.

PATASCO, a river of Maryland, U.S., rises on the northern boundary of the state, and flows westerly 50 miles to the Chesapeake Bay, 14 miles south of Baltimore, to which city it is navigable. Its falls furnish water-power to numerous factories.

PATCHOULI. This very interesting material is the dried branches of *Pogostemon Patchouli* (natural order *Labiata*), which was first introduced to this country as an article of merchandise in 1844. The plant is a native of Sikkim, the Malay coast, Ceylon, Java, the neighbourhood of Bombay, and probably also of China; but owing to the hardness of Asiatic for the perfume which it yields, it is difficult to say where it is native or cultivated. Every part of the plant is odoriferous, but the younger portions of the branches with the leaves are chosen; they are usually about a foot long. The odour is peculiar and difficult to define, but it has a slight resemblance to sandal-wood; it is very powerful, and to many persons is extremely disagreeable. The odour of patchouli was known in Europe before the material itself was introduced, in consequence of its use in Cashmere to scent the shawls with a view of keeping out moths, which are averse to it; hence the genuine Cashmere shawls were known by their scent, until the French found the secret, and imported the herb for use in the same way. Its name in India is *Pachot*, and it is there used as an ingredient in fancy toilet-soaps, and as a perfume for the hair. It is also much prized for keeping insects from linen and woollen articles. The essence of patchouli is a peculiar heavy brown oil, with a disagreeably powerful odour; it is obtained by distillation, and requires extreme dilution for perfumery purposes.

PATELLA, or *KNEE-CAP*, is a Scissoid Bone (q. v.), developed in the single tendon of the *extensor externus*, and *extensor internus* muscles—the greater extensor muscles of the leg. It is heart-shaped in form, the broad end being directed upwards, and the apex downwards. The anterior or external surface is convex, perforated by small apertures for the entrance of vessels, and marked by rough longitudinal striae, while the posterior or internal surface is smooth and divided into two bands by a vertical ridge, which corresponds and fits into the groove on the lower articulating surface of the femur or thigh-bone, while the two facets (of

which the outer is the broader and deeper) correspond to the articular surface of the two condyles.

This bone is liable both to dislocation and fracture.

Fig. 1.—Posterior surface of right Patella.

1, outer facet; 2, inner facet; 3, surface to which the ligamentum patellæ is attached.

except in one rare variety, the dislocation is capable of being reduced without any difficulty. Fracture of the patella may (like dislocation) be caused either by muscular action or by mechanical violence.

Fracture by muscular action is the more common of the two forms, and occurs thus: A person in danger of falling forwards,

Fig. 2.

a, rectus muscle; b, vastus externus muscle; c, ligamentum patellæ; d, external condyle of right femur; e, head of tibia; f, head of fibula.

reunion of the parts, and the case generally results either in mere ligamentous union or in no true union at all.

PATELLA and PATELLIDÆ. See **LIMPER.**

PAT'EN (Lat. *patina*, a dish), the plate employed for the elements of bread in the Eucharistic service. Anciently it was of considerable size; and while the practice of the **OFFERTORY** (q. v.) continued, there was a special paten for the bread-offering. In the Roman Catholic Church, in which the unleavened wafer-bread is used, and the communion is distributed from a distinct vessel called **PYX** (q. v.), the paten is a small circular plate, always of the same material with the chalice. It is often richly chased or carved, and studded with precious stones. It is used only in the mass.

PA'TENT is an exclusive right granted by the crown (in letters *patent* or open, whence the name) to an individual to manufacture and sell a chattel

or article of commerce of his own invention. The policy of the present law of patents has latterly been much canvassed, and it has been suggested that, instead of the present monopoly, with the drawback of litigation to which it uniformly gives rise, the use of all inventions should be dedicated to the public at once, and the inventor rewarded by a pension from the state, according to the merits and utility of the invention. The present law allows the inventor to have a monopoly of his invention for fourteen years, with a further privilege at the end of that time, provided he has not been sufficiently remunerated, to have the patent renewed for a further term of fourteen years. That some mode of rewarding the individual whose perseverance and ingenuity have enabled him to discover a new invention should be established, is universally admitted, but whether it should be at the expense of that part of the public who are purchasers, and therefore benefited by his discovery, or by the public at large in the shape of a pension, is a matter still undecided. The evils of the present law are that there is a great deal of uncertainty in the mode of ascertaining what is a new invention. Hence, when a patent has been granted, if it is of such a nature as to lead to competition, infringements are almost matters of course, and the only mode of discovering and checking the infringement is so tedious, costly, and ineffective, that inventors generally pass their lives in constant litigation, fighting in detail a succession of imitators who often have nothing to lose by defeat, and therefore entail all the greater burden on the legitimate manufacturer. It has been said that not more than three patents per cent. are remunerative. A royal commission has latterly been engaged in inquiries as to the best mode of remunerating inventors, and improving the law in reference to infringements; but it is doubtful how far the subject is capable of being put on a better footing, so many difficulties being inherent in it. The crown seems always to have enjoyed the prerogative right to grant monopolies, and this had been so greatly perverted in the time of Elizabeth, that the popular clamour led to a statute in the following reign, having for its object to prevent the crown in future making any grants of that kind which should be prejudicial to the interests of trade. By that act an exception was expressly made in favour of new inventions. At first the judges construed grants of monopoly to inventors very strictly; but afterwards it was seen that they were for the benefit of trade, and were dealt with more liberally. An important modification of the law was introduced by a statute of Queen Anne, which required every inventor to describe in detail the nature of the invention in an instrument called a specification. Another statute of 5 and 6 Will. IV. c. 83, further altered the law by allowing parties who had a difficulty in separating what was new from what was old in their invention to enter an express disclaimer of that part which was not new. But the most important alteration was made in 1852, by the statute of 15 and 16 Vict. c. 83, which reduced the fees, and otherwise improved the practice attending the obtaining of patents for the United Kingdom. Before stating shortly the substance of this act, it may be observed that there has always been a difficulty in defining what is an invention that is patentable—a difficulty which no act of parliament can get rid of, for it is inherent in the subject-matter. It has been held that a patent must be not merely a discovery of a new substance or article of food, but it must be a combination of processes producing some new result, or an old result by different means. It is of the essence of the patent that it be entirely new, that is,

that it should not have been described in a published book, or well known in the business of the world, was publicly used before. What amounts to a public use is necessarily difficult of definition, but the thing must have been so used that others may lawfully know, and need it besides the inventor. The specification must be so drawn, as to give a full disclosure of the novel, and describe it so that an intelligent person could from the description make or produce the article itself.

There is a patent-office in London, in Edinburgh, and in Dublin. All the business connected with patents is now transacted at the office in London, the Scotch and Irish offices being used only as places for depositing copies of patents, specifications, and drawings. The commissioners of patents are the Lord Chancellor, Master of the Rolls, Attorney and Solicitor General of England and Ireland, and the Lord Advocate and Solicitor General of Scotland. The mode in which an invention proceeds is, first to present a petition for a grant of letters-patent, accompanied by a statement in writing of the specification, a copy of which must be left at the patent-office. These papers, as also drawings must be in a certain prescribed form. The application is referred, as a matter of course, to one of the law officers of the crown, who may call to him and a certain person to be paid by the applicant. A provisional patent may be applied for in the first instance, and the complete patent deferred for six months—an arrangement which gives the inventor a security to the applicant of time to prepare and test the specification, and of paying the expenses more gradually; but the effect is the same in the end, the patent dating from the first application. After a patent has been granted, and been in existence for three years, a fee of £20 must be paid; and, at the end of the seven years, a fee of £100. The letters-patent extend to the whole of the United Kingdom. The petition with reference to patents, especially as to the drawing of the specification, is too minute to justify an inventor in stopping to take out a patent without professional aid, and a class of persons called patent agents is known for, which no qualifications are at present required by any constitutional authority, devolve themselves to the branch of business. But great caution is required in selecting those only who are respectable and honourable. Their charges are generally maintained by estimate beforehand, and are usually made in a round sum. The fees payable to the law officers are as follows: On being petitioned for grant of letters-patent, £5; on notice of intention to proceed with application, £5; on warrant of law officer for letters-patent, £5; on granting of letters-patent, £5; on drawing specifications, £5; at or before expiration of third year, £20; at or before expiration of seventh year, £100.

Beside these fees, if opposition is entered to the grant, additional law are incurred, both by the party opposing and the party opposing.

A patent obtained in this country does not extend to the colonies, but several of the colonies have authority for granting patents for a like period to the United States, patents are also granted here for 14 years. In France, the term is 5, 10, or 15 years, at the option of the applicant; in Prussia for 10 years; in Russia, for 5, 10, or 15 years; in Austria for 5, 10, or 15 years; in Belgium, for 10 years; in Holland, for 5, 10, or 15 years; in London, not more than 10 years; in Saxony, 5 years. In all cases, fees are exigible from the inventor.

PATERA (Lat.), a round dish, imitations of which were carried by the Romans in the pouch

of their collings, &c. The name is also applied

Patera.

to the foliated ornaments used in the same position.

PATERCULUS, C. VESPAZIUS, a Roman historian, descended from an ancient and wealthy Campanian family, is thought to have been born about 19 a. c. He entered the army at an early age, and from 4 to 13 a. c. served under Tibertius as prefect or legate in Germany, Pannonia, and Dalmatia. He was a great favourite with Tibertius, and when the latter became emperor, 14 a. c. P. was appointed praetor. He was alive in 30 a. c., as his history comes down to that year; but it is conjectured that in the following year he was probably put to death as one of the friends of Sejanus, of whom he speaks highly in his work. P.'s claim to remembrance is his *Historia Romana*, a compendium of universal, but more particularly of Roman history, in two books. The work, as we have it, is not complete; the beginning, and a portion following the 8th chapter, being wanting. It seems to have commenced with the fall of Troy, and describes only the most prominent historical incidents, but these, fortunately, with considerable fulness of detail. Scholars are satisfied that it is the work of a man who is, on the whole, impartial and discriminating. The style is based on that of Kallias. The *ultima princeps* of the *Historia Romana* appeared at Basel in 1591, the most valuable is Hinrichsen's, on account of its excellent notes (Leipz. Bat. 1759); reprinted by Frotscher (Leipz. 1835-1836); but Orelli's (Leipz. 1835) has the least corrupt text.

PATEREROS, were small pieces of ordnance, now obsolete, worked on screws; most commonly used on board ships, where they were mounted on the gunwale, and discharged showers of old nails, &c., into hostile boats. The French called them *Pierriers*, from loading them with stones.

PATER-NOSTER (Lat. 'Our Father') called also **THE LORD'S PRAYER**, a short form of prayer approved or prescribed by our Lord to his disciples (Matt. vi. 9-13, Luke xi. 1-4) as the model according to which, in contrast with the prayers of the Pharisees, their petitions ought to be composed. From the earliest times the Pater-Noster has been accepted as, by excellence, the form of Christian prayer. It formed part of all the ancient liturgies. So sacred, indeed, was its use, that, strange as the provision may now appear, it was comprehended among the things which were reserved from heathen and catechisms under the well-known Discipline of the Secret (q. v.). The early fathers—Origen, Tertullian, Cyprian—refer to it in terms which show that even then it was a recognized form of private prayer. It was solemnly recited at the administration of baptism, and one of the privileges of the baptized was the use of the Pater-Noster. More than one of the fathers, and very many later writers of every form of Christian belief, have devoted special treatises to the explication of this prayer, which is regarded as embracing in its few but comprehensive clauses all the fitting and legitimate objects of the prayer of a Christian. The Catechism of the Council of Trent contains a

detailed exposition and commentary of it, and in all the services not only of the Roman Missal, Breviary, Ritual, Processional, and Ordinal, but in all the occasional services prescribed from time to time, it is invariably introduced. In the Rosary (q. v.) of the Virgin Mary it is combined with the Hail Mary, the prayer addressed to the Virgin (whence the larger beads of the 'Rosary' are sometimes called *Pater-Nosters*), and perhaps the most usual of all the formal shorter devotions among Roman Catholics is the recitation a stated number of times of the 'Pater,' with one or more 'Ave Marias,' generally concluding with the Doxology. The form of this prayer as commonly used by Protestants concludes with the clause, 'for Thine is the kingdom, and the power, and the glory for ever. Amen.' This clause is not used by Roman Catholics. Of the two gospels—that of Matthew and that of Luke—in which the delivery of the prayer by our Lord is related, that of Luke has not this clause; and even in the Gospel of Matthew it is found only in the later MSS., in which it cannot be doubted that it is a modern interpolation. It was retained, however, in Luther's German translation, and in the Authorised Version, whence its use became common among Protestants.

PATERSON, a city of New Jersey, U.S., at the falls of the Passaic River, on the Morris Canal, and New York and Erie Railway, 17 miles north-west of New York, a well-built city, with 8 cotton factories, 10 machine factories, extensive paper-mills, and factories of cotton, duck, flax, hemp, &c., to which the falls of the Passaic furnish abundant water-power. The half of the locomotives made in the United States are manufactured here. The city contains county buildings, an academy, bank, 2 newspapers, and 16 churches. Pop. in 1860, 19,588.

PATERSON, WILLIAM, the most celebrated, after John Law (q. v.), of the commercial schemers of the 17th c., was, like Law, a Scotchman, and is said to have been born in the parish of Tinwald, Dumfriesshire, about 1660. Of his early history nothing is known beyond the fact, established by conclusive evidence, that he possessed himself of an extensive and minute knowledge respecting the institutions and commerce of foreign countries. His first appearance in history is at the time when he laid before the merchants and capitalists of London the complete draught of his scheme of banking. The scheme was favourably, nay even eagerly, adopted by them, and after being modified so as to render it practically serviceable, became the basis of an institution which, in 1690, was incorporated under the name of the 'Bank of England.' P., however, soon became, for reasons now unknown, disconnected with the Bank. His next project was the renowned Darien Scheme (q. v.), which received the royal sanction in 1695, and came to ruin in 1701. Its disastrous failure so affected P. as to produce temporary lunacy, and after his recovery he lived in retirement. Nothing further is known concerning him.

PATHOLOGICAL ANATOMY, or the anatomy of diseased organs, is included in, but must not be confounded with pathology, as until comparatively lately was often the case. It is merely a section—although a most important section—of pathology, contributing (as Professor Vogel has well remarked) 'to practical medicine the solid materials from which to construct a basement, without having the power to erect a perfect edifice.' Pathological anatomy enables the surgeon to decide whether a suspicious tumour is malignant or of a comparatively harmless nature, and

in many other ways is of the greatest importance to surgery; and although at first sight it might appear to be of small importance in relation to Therapeutics, this is not in reality the case. Scientific treatment necessarily demands an accurate knowledge of the material changes which lie at the foundation of the various morbid symptoms. Hence pathological anatomy not only forms a portion of the positive basis of Therapeutics, but it also points out the processes by which the different altered parts may be gradually restored to their normal condition. It not merely indicates what requires healing, but in many cases also the course that must be adopted in order to aid the curative tendency of nature. It likewise serves as a check on therapeutics, exposing, in a most conclusive manner, the absurdity of many pretended methods of cure. It points out, for example, that in a certain stage of inflammation of the lungs (Pneumonia) a fibrinous fluid separates from the blood, and by its coagulation renders a portion of the tissue of the lung impermeable to air; and further that it requires several days for this coagulated matter to resume the fluid condition and to be removed. If any one should assert—and such assertions have often been made—that in this stage of the disease he could apply a remedy which would cure the patient in a few hours, a very slight knowledge of pathological anatomy would shew the folly of such an assertion. The best English works on this subject are Vogel's *Pathological Anatomy of the Human Body*, and Jones and Sieveking's *Manual of Pathological Anatomy*.

PATHOLOGY (from the Gr. *pathos*, disease, and *logos*, a discourse) is that department of medicine which treats of the doctrine of morbid actions or diseases. In this country the term is so far restricted as not to include the causes, treatment, &c., of diseases, but the most eminent French and German writers regard it as equivalent to 'the Theory and Practice of Medicine,' and consider it as treating not only of the classification, causes, symptoms, and physical signs of diseases, but as also including their seat, the phenomena which precede and follow them, their progress, their duration, their modes of termination, the different forms in which they occur, their complications, the changes to which they give rise in the solids and fluids of the body, and their treatment.

PATMOS, a bare and rocky island in the Egean Sea, about 45 miles in circumference. It belongs to the group called the Sporades, lies to the south of Samos, and is now called Patino, but in the middle ages *Palmosa*, although there is now only one palm-tree in the whole island. It is celebrated as the place to which the apostle John was exiled, and where he saw the visions recorded in the Book of Revelation. On the top of a mountain stands the famous monastery of 'John the Divine,' half way up to which a cave is pointed out to the traveller in which, according to tradition, the apostle received his revelations. See Ross's *Reisen auf den Griechischen Inseln des Agäischen Meeres*, and Guérin's *Description de l'île de Patmos*, &c. (Paris, 1856).

PATNA, or more correctly, PATTANA (i.e., the town), an important trading town of Hindustan, capital of a British district of the same name, stands on the right bank of the Ganges, 10 miles east of Dinapur, and 377 miles by land, and 464 miles by water, north-west of Calcutta. The city proper, forming a quadrangle, extends a mile and a half along the river-side, and is half that extent in breadth. P. is generally supposed, however, to include the suburbs, which stretch on each side

of it, on the south bank of the Ganges. The European quarter is in the west of the town proper; farther toward the river are neither numerous nor of imposing appearance. In this quarter is a large school, in which the English language and literature form important branches of study. It is not a pleasant part of residence; its streets are covered with mud and close in winter, and the air is thickly impregnated with smoking dust in summer. Its temperature runs unusually high during the hot season, being increased by the heat reflected and radiated from a bare tract of sand on a neighbouring island in the Ganges. Pop. about 254,000.

P., under the former name of *Endanacott*, is supposed to have been the capital of Bihar, A.D. 1000, &c. Here, at an early period, the English established factories, and traded in opium, rice, &c. — But disputes about transgressions across between the company's servants and the native government, &c. were common, the result of which was that the British drove out the native forces, and took possession of the district.

PATOU (of uncertain derivation), the French has applied to corrupt dialects of a language spoken by the uneducated. See *DRACON*.

PATON, James Nairn, R.S.A., one of the most distinguished living Scottish artists, was born in Aberdeen in 1833. It is understood that in early life he employed himself in making designs for the various manufacturers of his native place, and for the mills and lace-manufacturers of Paisley. He, however, soon turned his attention to the work of an artist, and his cartoon sketch 'The Spirit of Liberty' gained one of the three premiums at the Association Hall competition in 1845. Two years later, his oil picture of 'Christ leaving the Cross' and his 'Desecration of Oberon and Titania' jointly gained the prize of £300. He subsequently executed a composite picture to the Association, entitled the 'Quarrel of Oberon and Titania,' and sold now upon the Royal Scottish Academy's galleries in Edinburgh. These pictures won the artist's reputation. Although somewhat low and dry in colour, and without any reticence or shadowy depths, they are full of brilliant fancy; and the beauties of Algeria, and the variety of the incident, attract the spectator much in the way that the fanciful sparkle of Gogarty or Sheridan attracts the reader. He has since painted much more serious and powerfully. 'Dante Meditating the Death of Francesca' was exhibited in Edinburgh in 1857; and his 'Dead Lady,' a work of great and warm pathos, in 1854. In 1858, his great picture 'The Banquet of Cleopatra' was exhibited in that city. It was much criticised and much admired. He had since painted 'Home from the Crimea,' a picture of which is in the possession of Her Majesty; and 'A Moorland,' a scene from the Indian war, and for the Association for the Promotion of the Fine Arts in Scotland, a series of picture-illustrations of the 'Drama of Yarrow.' The two works referred to have been engraved, and are deservedly popular. His last picture of importance, 'Cathar at Erfurt,' was exhibited in London in 1862, and subsequently in Edinburgh. When not occupied himself to painting alone. In connection with his brother, he illustrated Professor Layton's *Legs of the Scottish Cavaliers*, published Christmas 1863; and for the London Art Union, 1864, he executed twenty illustrations of the *Journal of Robinson*.

P. has worked with the pen as well as with the pencil. In 1861 appeared his volume of verse, entitled *Patos* by a Painter, full of grace, beauty, and originality.

PATONCE, *Charme*, in Heraldry (*Lat. patens*, expanding), a cross with its terminations expanding like early vegetation or an opening blossom.

PATOS, *LAGOS* 1885. See *EVIL*, Rio Grande do.

PATRAS (ancient *Patras*, Turk. *Balabakir*), a fortified seaport, and the most important trading town in the west of Greece, in the government of Achaia and Elis, stands on the eastern shore of the gulf of the same name, 12 miles south-south-west of Lepanto. It is overlooked by the strong citadel — on the site of the ancient *Asterion* — crowning a ridge, on the southern slopes of which the ancient city, as well as the modern one before the revolution, was built. The P. of today stands on a level upon which the sea. The place of P. is exceedingly valuable for the currents given, and which are the most important export of the town. Its harbour, though protected by a mole, is unsafe, and exposed to heavy seas. *Castagnettes* frequently come, and most of the houses are on that account only of one story. *Cappotes*, made of mixed wool and goat's hair, are manufactured; and besides currants, silk, cotton, wool, and hides are exported. P. is a thriving town, and has almost entirely recovered from the injury it sustained during the Greek revolution. Pop. about 20,000.

Patras is the only one of the 'twelve cities' of Achaia which still exists as a town; but most of its relics have been swept away by earthquake and revolution.

PATRIA POTESTAS is the term used to express the power which the civil law gave to the Roman father over his children, and which has been the foundation of the greatly modified paternal authority recognised in modern systems of jurisprudence. The right of a parent to control his child not come to years of discretion is a part of natural law, but the more extensive *patria potestas* of the Romans was probably a relic of those early times in which families, or tribes, considered as families, led a wandering pastoral life in dread of each other, under the guidance of a chief, whom it was necessary to invest with an almost unlimited authority.

By the Roman law, the *patria potestas* was acquired naturally, by the birth of a child in wedlock, or civilly, by legitimation or adoption. An emancipated son or daughter, a grandchild by a son, or any other descendants by males, was viewed as a part of the parent's property. In early times a father had the power of life and death over his children: by the Laws of the Twelve Tables he could sell them as slaves or could transfer them to another family by adoption. Under the republic, the despotic authority exercised by fathers over their offspring was practically limited to a considerable extent by the censors, and several emperors issued constitutions to restrain the excessive abuses perpetrated by fathers towards their children. First the right of sale, and then that of life and death was taken away. Alexander Severus restricted the right of the father to moderate chastisement, and Constantine declared that the father who should kill his son was to be held guilty of murder. By the early Roman law, the son, being in his father's power, could not acquire property for himself; his acquisitions all belonged to his father; hence he was incapable of making a testament. There were, however, particularly in later times, modes by which he could acquire *pecunia*, or property which should be independent of his father. A father might give

Patonce

his son property to trade on, which would be his own; and latterly a son acquired for himself whatever he gained in military service, or by the discharge of certain civil functions. In all matters belonging to the *jus publicum* a son was independent of his father; he could vote at the elections, hold the most important offices of state, or command the army. He could also be a tutor, tutory being considered a *munus publicum*. In later times, a son promoted to the consular dignity ceased to be under the restraints of paternal control, but, unlike an emancipated son, he retained his rights of succession. Lawful children were entitled to aliment from their parents; an obligation attached in the first instance to the father and mother, and, failing them, to the grandfather. Until the time of Justinian, illegitimate children had only a claim for support against their mother; that emperor gave them a right to demand aliment from their father.

In no modern system has the paternal power been carried so far as under the Roman law. According to the French 'Code Civile,' a child is under the authority of his parents till majority or emancipation; up to that time he cannot quit the paternal residence without leave of his father, except for enrolment in the army at 18 years of age. Majority is attained at the age of 21, but a minor is emancipated by marriage. At 15, a minor may be emancipated by his father, or, if his father be dead, by his mother, by a simple declaration before a magistrate. The father possesses somewhat extensive powers of chastisement. He may obtain a warrant to arrest his child under 16, and detain him in prison for a month; and an order may be obtained for the incarceration for six months of a child above 16, on cause shewn to the satisfaction of the magistrate. Parents are entitled to the usufruct of their children's property till the age of 18 or emancipation, subject to the burdens of maintenance and education; but this right does not extend to property acquired by the industry of the children, or bequeathed by a stranger under the condition of an exclusion of parental interference.

By the law of England, a father is guardian to his lawful children in minority, though this right ceases to some extent at 14. He has the power of moderate chastisement. As guardian, he receives the rents of any real estate which the child may possess, which he must account for when majority is attained. The paternal power never extends beyond majority, and, to some effect, marriage acts as an emancipation. A father may by deed appoint a guardian to such of his children as are unmarried at his death till they attain majority.

In Scotland a father has a general control over the persons of his children during pupilarity; that is, till the age of 14 in the case of sons, and 12 in the case of daughters. He may fix their place of residence, direct their education, and inflict reasonable chastisement. The limits of the *patria potestas* as regards children who have attained puberty, but are under 21 years of age, are not very exactly defined; but it seems to be understood that in ordinary circumstances minors are not entitled to choose their own place of residence in defiance of paternal authority. The father is administrator-in-law, and tutor and curator of his children, unless in the case of an estate left by a stranger and placed under separate management. This guardianship ceases on majority, or on the marriage of a daughter.

PATRIARCH (Gr. *patriarches*, the head of a tribe) is the name given to the heads of the families in the antediluvian period of Scripture history, and is still more familiar as the designation in Jewish history of the three progenitors of the Jewish people, Abraham, Isaac, and Jacob. In the

later history of the Jews, too, after the destruction of Jerusalem, the name was used to designate the heads of the Sanhedrim, one of whom, the patriarch of the west, resided at Tiberias, in Galilee, and the other, the patriarch of the Eastern Jews, at Babylon. The most familiar use of the word, however, is in the history of the Christian church. It is the name given to the bishops of certain great Metropolitan (q. v.) Sees, who not only held rank beyond other metropolitans, but also enjoyed a jurisdiction almost identical with that of the metropolitan in his own province over all the metropolitans themselves (with their provinces) included in their district, which was called a **PATRIARCHATE**. The name patriarch originally seems to have been given commonly to bishops, or at least was certainly given in a less special sense than what it eventually assumed; nor can the date at which the title first assumed its now received use be exactly determined. It is certain, however, that the name and the office were both recognised before the Council of Nice, at which time, as we learn from the sixth canon, the patriarchal sees, acknowledged by 'ancient custom' were three in number, Rome, Antioch, and Alexandria. After the translation of the seat of empire to Byzantium, thenceforward called Constantinople, that see, originally subject to the metropolitan of Heraclea, obtained, first metropolitan, and afterwards patriarchal rank; and eventually established a precedence over the patriarchs of Antioch and Alexandria, being second only to Rome. The contests between the patriarchs of Rome and Constantinople were among the chief causes of the GREEK SCHISM (q. v.). To these four patriarchates was added a fifth, in the year 451, that of Jerusalem, which was formed out of the ancient patriarchate of Antioch. The limits of these five patriarchates can only be loosely assigned. The authority of a patriarch was, in the main, that of a metropolitan, but extended over the metropolitans themselves. He had a right to consecrate the metropolitans, and to preside over the councils of his patriarchate. After the Greek Schism, and particularly after the establishment of the Latin Kingdom of Jerusalem, Latin prelates were appointed with the title and rank of patriarch in the four great Eastern sees. It was hoped that the union of the churches, effected at the Council of Florence, would have put an end to the contest thus created; but that union proved transitory, and the double series of patriarchs has been continued to the present day. The Nestorian and Eutychian sections of the Eastern Churches, too, have each their own patriarch, and the head of that portion of the former, which in the 16th c. was reconciled with the Roman see, although known by the title of *Catholicos*, has the rank and authority of patriarch. After the separation of the Russian Church from that of Constantinople, the name and authority of the metropolitan in the end was transformed into that of patriarch. But the office was suppressed by Peter the Great.

Besides these, which are called the Greater Patriarchates, there have been others in the Western Church known by the name of Minor Patriarchates. Of these the most ancient were those of Aquileia and Grado. The latter was transferred to Venice in 1451; the former was suppressed by Benedict XIV. France also had a patriarch of Bourges; Spain, for her colonial missions, a patriarch of the Indies; and Portugal a patriarch of Lisbon. These titles, however, are little more than honorary.

In the non-united Greek Church, the ancient system of the three patriarchates of Constantinople, Antioch, and Jerusalem is nominally maintained, and the authority of the patriarchs is recognised by their own communion. But the jurisdiction-limits

PATNAICHAT CROSS—PATRICK ST. ORDER OF

The patriarch of Constantinople, who is acknowledged as the head, have been much afflicted. The Armenian Church withdrew from him partially in the 17th, and finally in the 18th century. That Armenians have been gradually separated from the independence of the kingdom of Armenia; and some years since it formally declared its independence. The patriarchs of Jerusalem and Antioch are few in numbers of their own rite.

PATRIARCHAL CROSS, a cross which, like the patriarchal cross, has its upright part crossed by two horizontal bars, the upper shorter than the lower. A cross so described is mentioned in verse 4 of the Benedictus in the Mass.

PATRICIAN (Lat. *patricius*, from *pater*, father), a name given to the members of Roman families of whose line the *papirius* *famulus* consisted, and to their descendants by blood and adoption. *Patres* and *plebs* were in the early days of Rome synonymous, they were so named from the *patrum* *curia*, and they extended over the whole state, and at first of whom it was composed. Niebuhr's theories have established that, until the plebs were a distinct order, the *patricians* were the only citizens in possession of Rome; a select number of them were senators, and the original magistrates, based in a small circle of families, were known by the name of *clan* or *gens*. The distinction of the three tribes of *Romuli*, *Tities*, and *Lavinia*, was but a distinction between *patres* *patrum* *gentium* and *patres* *plebis* *gentium*—the latter not being applied to families recently elevated to equality with the old *patrician* ones. On the establishment of the plebs as a distinct order, more certain rights with the *patricians*, the *plebs* became an aristocracy of birth, in the sense possessed of a number of important privileges. A long struggle between the two orders led to the statement by the *plebs* of a *patrician* *tribune*, and the establishment of a new aristocracy of wealth based on wealth and office. Under constant the dignity of *patricius* became a social title, and hereditary, but conferring very few immunities and certain privileges. It was hereditary, transmissible, and not confined to Roman citizens of the same, but sometimes bestowed on foreign princes. These *patricians*, unlike the Roman ones, were distinguished in dress and arms from the ordinary citizens. The *pater* in the times concerned the same title on children and grandsons, including many of the Germanic people. In several of the Germanic kingdoms the title of *patrician* was bestowed on distinguished persons, and in some parts of Italy the hereditary *patres* are still styled *patricians*.

[illegible]

PATRICK, St. George, of a national order of knighthood for Ireland, established by George III. on the 3d of February 1783, and enlarged in 1833. As originally constituted, it consisted of the Sovereign, the Grand-master (who was always the Lord-Lieutenant of Ireland for the time being), and 16 Knights. By the statutes of 1833 the number of knights was increased to 24.

The *Dollar* of the order (of gold) is composed of rows alternating with large, tied together with a

knot of gold, the roses being enamelled alternately white within red, and red within white, and in the centre is an imperial crown surmounting a harp of gold, from which the badge is suspended. The *Badge* or *Jewel* is of gold, and oval; surrounding it is a wreath of shamrock proper on a gold field; within this is a band of sky-blue enamel charged with the motto of the order, *QUIS SEPARABIT MDCLXXXIII.* in gold letters; and within this band a saltire gules (the cross of St Patrick), surmounted by a shamrock or trefoil slipped vert, having on each of its leaves an imperial crown or. The field of the cross is either argent, or pierced and left open.

Order of St Patrick.

A sky-blue *Ribbon*, worn over the right shoulder, sustains the badge when the collar is not worn. The *STAR*, worn on the left side, differs from the badge only in being circular in place of oval, and in substituting for the exterior wreath of shamrocks eight rays of silver, four of which are larger than the other four. The *MANTLE* is of rich sky-blue tabinet, lined with white silk, and fastened by a cordon of blue silk and gold with tassels. On the right shoulder is the *HOOD*, of the same materials as the mantle.

The order is indicated by the initials K. P.

PATRIPASSIANS (Lat. *pater*, father, and *passus*, suffered), the name of one of the earliest classes of anti-Trinitarian sectaries, who, in maintaining the oneness of the Godhead, held that all that is ascribed in the Scriptures, according to the Trinitarian exposition, to any of the Three Persons, is in reality true of the one Principle, whom alone these sectaries admitted, being in consequence called 'Monarchians' (Gr. *monos*, one, and *arche*, principle). The leader of this sect was Praxeas, a native of Phrygia, who lived in the end of the 2d century. The name P., for which the Greek equivalent was *Patropaschite*, was in some sense a sobriquet, being founded on what their antagonists regarded as the absurd consequence derivable from their doctrine—viz., that as it was true to say that Jesus, in whom dwelt the Logos, or the Son, suffered, therefore it

would be true on their principles to say that the Father suffered. The sect in this particular form was chiefly known in Rome; but their principles are in the main the same with those of the Sabellians. In Rome, Praxeas was succeeded by Noetus, but the party does not appear to have been numerous or influential.

PATRO'CLUS. See **ACHILLES**.

PATRO'L is a detachment of five or six soldiers, fully armed, sent out, under a sergeant, from the main guard or picket to traverse the streets of a garrison town, &c., and arrest disorderly persons or soldiers out of barrack without proper pass-*s*. Prisoners are taken to the guard-house, and brought before the town-major. In a besieged fortress, *patrols* are strong bodies of men employed to promenade the lines of defence, and watch against any assaults on the part of the enemy.

PATRON (Lat. *patronus*, from *pater*, father), among the Romans originally signified a citizen who had dependents, who were called *clientes*, attached to him. Before the time of the Laws of the Twelve Tables, the most frequent use of the term *patronus* was in opposition to *libertus*, these two words being used to signify persons who stood to one another in the relation of master and manumitted slave. The Roman was not denuded of all right in his slave when he freed him; a tie remained somewhat like that of parent and child, and the law recognised important obligations on the part of the *libertus* towards his patron, the neglect of which involved severe punishment. In some cases the patron could claim a right to the whole or part of the property of his freed man. The original idea of a patron apart from the manumitter of slaves continued to exist. A Roman citizen, desirous of a protector, might attach himself to a patron, whose client he thenceforward became; and distinguished Romans were sometimes patrons of dependent states or cities, particularly where they had been the means of bringing them into subjection. Thus the Marcelli were patrons of the Sicilians, because Claudius Marcellus had conquered Syracuse and Sicily. The patron was the guardian of his client's interests, public and private; as his legal adviser, he vindicated his rights before the courts of law. The client was bound, on various occasions, to assist the patron with money, as by paying the costs of his suits, contributing to the marriage portions of his daughters, and defraying in part the expenses incurred in the discharge of public functions. Patron and client were under an obligation never to accuse one another; to violate this law amounted to the crime of treason, and any one was at liberty to slay the offender with impunity. One obvious effect of the institution of *clientela* was the introduction of an element of union between classes of citizens who were otherwise continually brought into opposition to each other. As the patron was in the habit of appearing in support of his clients in courts of justice, the word *patronus* acquired, in course of time, the signification of advocate or legal adviser and defender, the client being the party defended; hence the modern relation between counsel and client.—*Patron*, in after times, became a common designation of every protector or powerful promoter of the interests of another; and the saints, who were believed to watch over the interests of particular persons, places, trades, &c., acquired in the middle ages the designation of their *patro* saints. The saint in whose name a church is founded is considered its patron saint.

The term Patron has also been applied to those who endowed or supported churches and convents. See **PATRONAGE**, **ECCLESIASTICAL**.

PATRONAGE, ECCLESIASTICAL, the right of presenting a lay person to a vacant ecclesiastical benefice. The custom, in the original and more strict sense, was the person who created or endowed the church. In the early ages of Christianity, the churches where the new religion had been adopted were parcelled out into large districts or dioceses, under the superintendence of a bishop, who usually resided in the neighbourhood of one of the religious houses. Within each district the bishop had the nomination of the persons who supplied religious instruction to the people. The priests were paid out of the episcopal treasury, and travelled about in the exercise of their duties, having their residences with the bishop, and forming that *synodus obsequii*, constituted the notion of cathedral churches and monasteries in their simplest form. Occasionally a bishop endowed a church in his diocese, and attached a priest permanently to it; and in time, in the first case, a bishop who founded a church in a new Christian district was allowed to appoint as incumbent of his church. As Christianity became more universal, and the population increased, the means of worship supplied by the bishopric, the monasteries, and occasional apostolically endowed churches, became inadequate for the demands of the people, and the prospect of lands began to hold and under churches in their own possessions. In such cases the chaplain or priest was not paid by the bishop, but allowed to receive for his maintenance, and for the use of his church, the whole or a part of the profits of the lands with which the founder had endowed it, and the offerings of those who frequented the church for worship. A district was divided by the founder, within which the functions of the officiating priest were to be executed, and here the houses and the advantages of his ministry were limited to the inhabitants of that district. As these private foundations tended both to the advancement of religion and to the relief of the episcopal treasury, they were encouraged by the bishops, who readily consecrated the churches thus established, and consented that the incumbent should be considered as the church, and receive the tithes and offerings of the inhabitants and what emolument the benefice had annexed to the church. Eventually, it came also to be understood by the bishop that the founder and his heirs should have a share in the administration of the property, and have the right to nominate a person in holy orders to be the officiating minister whenever a vacancy occurred. It also became a not unusual arrangement that when revenues of estates rebelt such churches as were dependent on the cathedral or undertook to pay the incumbent, to the relief of the cathedral, the right of presentation was transferred from the bishop to those persons, who thenceforward stood in the same relation to these churches as if they had been the original founders. Out of these private endowments arose the parochial divisions of a later time, which thus were their origin rather to accidental and private donation than to any legislative scheme for the ecclesiastical subdivision of the country. The founders of a parish were at first generally commoners with those of a manor, and the lord of the manor was the hereditary patron. The person enjoying the privileges of a founder was called *patronus* and *advocatus*. He had a pre-emptive seat and a special place in the church; he enjoyed a precedence among the clergy in processions; his name and arms were engraved on the church and on the church bells, and he was specially named in the public prayers. He had the right to a certain portion of the church funds, called *patronage*, and enjoyed the fruits of the benefice during a vacancy. In the course of time it sometimes happened that,

with the accumulation of all parties interested, the patronage, and the church with its revenues and appointments, were made over to a religious house, which thus became both patron and perpetual incumbent of the parish, while the immediate duties of the cure were devolved on a vicar or stipendiary priest. In France, the right of patronage was often extended to churches and originally private foundations by the nomination of the sovereign, which led them to take possession of church property, and bestow it in fee on laymen, who appropriated the greater part of the revenues, and took the appointment of the clergy into their own hands. For a length of time, not merely the nomination but the investiture of the clergy came to be exercised by lay patrons, a state of matters which caused the indignation of successive popes and councils: until it was at last ruled by the third and fourth Lateran Councils (1179 and 1215 A.D.) that the presentation of the patron should not of itself suffice to create any ecclesiastical benefice, even when qualified by the discretionary power of rejection given to the bishop, when the presenter was a layman. It was declared necessary that the presenter should not merely have the recommendation of the laity conferred on him by induction, but also be invested with the spiritualities by institution. When the bishop was patron of the benefice, the ceremonies of induction and institution were united in that of collation. With the growth of the papal power, however, a practice arose by which the right of presentation or induction, which had originally been left to the patron, became in some degree obligatory. Towards the close of the 12th c., letters of request, called *mandates* or *expedatives*, began to be issued by the pope to patrons, praying that benefices should be bestowed on particular persons. What had at first been requested as a favour was soon demanded as a right, and a code of rules was laid down with regard to grants and revocations of expedatives. In the 13th c. the patronage of all living whose incumbents had died at the court of Rome (*curia in curia*) was claimed by the pope; and as ecclesiastics of all ranks from every part of Europe frequently visited Rome, the number of benefices *curiales in curia* was always very great. Clement V. went so far as brazenly to declare that the pope possessed the full and free disposal of all ecclesiastical benefices. The practice next arose of the pope making revocatory grants, called *provisors* of benefices, during the lifetime of the incumbent, and reserving what benefices he thought fit for his private patronage. By means of permissions to hold benefices in *commendam*, and dispensations for non-residence and holding of pluralities, upwards of fifty benefices were often held by one person; and throughout all Europe the principal benefices were filled by Italian priests, nominees of the popes, who were often ignorant of the very language of the people among whom they ministered. In the 14th c. these claims encountered much opposition. England took the lead in an organised resistance, which was in the end successful. A series of English statutes was passed, beginning with the Statute of Provisors, 25 Edw. III. c. 6, solemnly vindicating the rights of ecclesiastical patronage, and subjecting to severe penalties (see *PROVISORS*) all persons who should attempt to enforce the authority of papal provisions in England. The principles adopted by the third and fourth Lateran Councils have since been substantially the law of patronage in Roman Catholic countries. A lay patron is, by the canon law, bound to exercise his right of presentation within four, and an ecclesiastical patron within six months, failing which the right to present *vacante jure devolvit* to the

bishop of the diocese. Patronage has always been more or less subject to alienation, transmission, and the changes incident to other kinds of property. The modern practice of patronage in the Roman Catholic church is detailed under the head *PROVISION* (q. v.).

In England, where the modified canon law, which was in use before the Reformation, is still in force, the rights of patrons do not materially differ from those which they possess in Roman Catholic countries. For some details regarding the right of presentation in England, see *ADVOWSON*.

In Scotland, at the Reformation, the rights of patrons were reserved, and presbyteries were bound by several statutes to admit any qualified person presented by the patron. The principle of these statutes was retained in the enactments introducing Episcopacy. On the establishment of Presbytery under favour of the civil war, patronage was abolished by act 1649, c. 23, and the election of the clergy was committed to the kirk-session. At the Restoration, this statute fell under the act rescissory, and patronage was replaced on its former footing. On the reintroduction of Presbytery at the Revolution, patronage was again cancelled, and the right to present conferred on the Protestant heritors and the elders of the parish, subject to the approval or rejection of the whole congregation. In consideration of being deprived of the right of presentation, patrons were to receive from the parish a compensation of 600 merks (£33, 6s. sterling), on payment of which they were to execute a formal renunciation of their rights. Only three parishes effected this arrangement with the patron, and patronage was permanently restored in all the parishes where no renunciation had been granted by 10 Anne, c. 12. This act, with modifications introduced by 6 and 7 Vict. c. 61, is now law. Should a patron fail to present for six months after the occurrence of a vacancy, the right to present falls to the presbytery *jure devoluto*. The presentee, before he acquires a right to the emoluments of the benefice, must be admitted to it by the presbytery of the bounds. He is first appointed to preach certain trial sermons, after which a day is fixed within six weeks for moderating in his call. On that day the people are invited to sign a written call to the presentee to be their minister, and however few the signatures to the call may be, the presbytery are in use to pronounce a formal judgment sustaining it. They then proceed to examine into the qualifications of the presentee, and provided the result be satisfactory, the ordination follows (if he have not been previously ordained), and he is formally admitted minister of the parish by the presiding minister. Soon after the above-mentioned act of Queen Anne, a feeling which had sprung up in favour of popular election, in opposition to patronage, led to various acts of resistance to the settlement of presentees, and brought about two considerable secessions from the Church of Scotland. It continued for a length of time to be a subject of dispute how far the right of the church to judge of the fitness of presentees could entitle her to make rules tending to disqualify them, and in particular whether she could legally make the dissatisfaction of the congregation a disqualification. For a long time prior to 1834, there had been no attempt to give effect to any dissent on the part of the congregation. In that year the law of patronage again became a ground of contention, when a majority of the General Assembly embodied their views on the subject in the so-called Veto Act, which declared that no minister was to be imposed on a congregation when a majority of heads of families and communicants should dissent from

his admission. The decision of the Court of Session, confirmed by the House of Lords, finding this act to be *ultra vires* of the General Assembly, led to the secession of 1843 and formation of the *Free Church* (q. v.). After that event, an act, 6 and 7 Vict. c. 71, commonly called Lord Aberdeen's Act, was passed to fix by a legislative provision the effect which the church courts were in future to be entitled to give to the dissent of the congregation in the collation of ministers. It is there enacted, that after the trial sermons, the presbytery shall give to the parishioners, being members of the congregation, an opportunity to state objections which do not infer matter of charge to be proceeded against according to the discipline of the church. The presbytery are either to dispose of the objections, or to refer them to the superior church judicatory; and if the objections be considered well founded, the presbytery may reject the presentee. No power is, however, given to reject him on the ground of mere dislike as such on the part of any portion of the congregation. In Scotland, patronage is in all cases a heritable right; it is transferable by disposition without infettment, but capable of being feudalised, after which it can be completely conveyed only by infettment.

In the Protestant churches of Germany, Sweden, and Denmark, patronage exists to some extent, subject to restrictions, which differ much in different localities. The right to present is sometimes divided between the patron and the consistory. The parishioners have in many instances a voice: the appointment may be entirely in their hands, or they may have merely a right to reject the presentee after he has been subjected to the ordeal of a trial sermon; and in either case this right may be exercised, according to local usage, either by the parishioners at large, by a committee of their number, or by the *bürgermeister*. When there is no patron, the choice generally rests with the consistory in East, and with the parishioners in West Germany. Induction by the superintendent completes the right of the presentee.

In the Greek Church the right to present is generally in the hands of the bishops, excepting in Russia, where lay patronage exists to a limited extent.

PATRONYMIC (Gr. *pater*, father, and *onoma*, name), properly a name taken from one's father, but generally applied to such names as express descent from a parent or ancestor. In Sanskrit, Greek, and Latin, patronymics are very numerous. They may be derived from the name of a father, mother, grandfather, or remoter ancestor, as *Atrides*, i.e., (Agamemnon), son of Atreus; *Philyrides*, i.e., (Chiron), son of Philyra; *Æacides*, i.e., (Achilles), grandson of Æacus. The names of the founders of nations have also been used to form a sort of patronymic, as when the Romans are called *Romulidæ*. In Greek and Latin the commonest terminations of patronymics are *ides* and *is*. Patronymics have no fewer than thirteen recognised terminations in Sanskrit. A number of the surnames in use in modern times are patronymics, as Johnson, the son of John; Thomson, the son of Thomas. Originally these names fluctuated from generation to generation, as still is, or very recently was, the case in Shetland, where Magnus Johnson's son calls himself John Magnusson or Manson. In the course of time, it was generally found more convenient to take a surname from one well-known ancestor, which should descend unchanged to the children of the bearer of it. The termination *s* is sometimes used as equivalent to son, as in Jones, Rodgers. To patronymics belong Norman, Highland, Irish, and Welsh surnames with the prefixes *Fitz*, *Mac*, *O'*, and *Ap*, respectively. In many cases the *Mac* of

the Highlands of Scotland seemed to have a Scottish character only a few generations ago. In 1801, when the parliament of Ireland was dissolved, the use of patronymics. Every Irishman "dangling between or among Englishmen in the streets of Dublin, Myrtle Field, or Kildare," was ordered "to take to him an English surname of a town, as Burton, Chester, Trym, Mayne, Clarke, Kinney, or others, as White, Black, or any in common, as Smith or Carpenter; or calling, as Clarke or Butler; and that he and his issue should use the same." At Water it was long the practice to use a stream of ancestral names, such with the syllable *de* prefixed to B. Cousin relates that "in the time of King Henry VIII. an ancient overlaided gentleman of Water being called at the parson of a day by the name of Thomas Ap William Ap Thomas Ap Richard Ap Most Ap Evan Vaughan, &c., was driven by the judge to leave that old manner; whereas he afterwards called himself Moston, pointing to the name of his principal house, and his last surname to his posterity." See NAME.

PATHE, Emma, nee Howdley (fl. 16th century), also called Emma Pender, a countess with its arms expanding towards the ends, and that at their outer edges.

PATUXENT, a river of Maryland, U.S., rises 20 miles west of Frederick City, and after a south-westerly course of 50 miles, empties by a broad estuary into Chesapeake Bay; navigable for small vessels for 30 miles.

PAT, a flourishing town of France, capital of the department of Puy-de-Dôme, on the right bank of the Garonne, 105 miles south-south-east of Bordeaux. It occupies a rocky height, some miles from the river, through which a canal flows into the Garonne, and united by a high bridge. Toward the south it commands some magnificent views of the Western Pyrenees; toward the north where its situation is hardly surpassed by that of any town in France. As soon as one leaves the distant Pyrenees rise in peaks, cones, and snow-capped villages, and present an outline as weird as it is strikingly beautiful. The town contains a palace of justice, a promenade, Royal Academy, with a bronze statue of Henri IV., beautiful theatre, university, academy, museum, and library of 25,000 vols. Linen and cloth manufacturers in the great branches of industry; in the vicinity, however, some good but through is grown. Many houses are built in the vicinity, and from the park the famous *Fontaine de la Reine* are made. Pat is a beautiful resort of the English, especially during winter, and is a general rendezvous for those who wish to explore the Pyrenees. Pop. 17,800.

The principal building, however, of Pat, and that to which it owes its existence, is the old castle which stands on the ridge overlooking the river, and being both the most conspicuous and most commanding feature of the town. It has five towers, raised by an outer wall, and is supposed to have been founded by Gaster in 1017 about the year 1017. Pat was the capital of the kingdom of Lorraine, and its castle was the birthplace of the famous Duke 10.

PAUL, the great apostle of the Gentiles, was born at Tarsus, parents at Tarsus, in Cilicia, and received from them the rights of Roman citizenship. His original name was Saul. He was educated first in his native city, then in the school of its reputation for the schools of literature and philosophy, where he doubtless learned to speak and write Greek; and afterwards, to be perfected "in the law of his father," was sent to Jerusalem, where he

studied under Gamaliel, a great Jewish doctor, and became one of the strictest, most zealous, and most ardent Pharisees. Whether it was here or at Tarsus that he acquired his knowledge—which we have no reason to believe was ever very deep—of the philosophy and literature of Greece, cannot be ascertained. According to the unanimous rule observed among the Jews, that every person should learn some trade, Saul became a tent-maker; and at this trade he afterwards laboured (Acts xviii. 3) for his support. A few years after the death of Jesus, he became, as might have been expected from his training and temperament, a fervent adversary of the new sect of Christians. We are told (Acts vi. 9) that the Jews of the Christian synagogue at Jerusalem were among those who disputed with Stephen, and it is natural to suppose that the young and brilliant scholar, eager for disputation, was conspicuous among the crowd of Jewish students who poured out of their synagogues (of which, according to the Talmud, there were 400 in the holy city), to the houses of their youth and scholarship, to crush the growing followers of the Nazarene. This supposition is rendered highly probable by the fact, that he was present at the martyrdom of Stephen, which followed almost immediately, having charge of the removal of them that slew him. He now became a prominent actor in the great persecution of the Christians that broke out at Jerusalem. The mysterious circumstances that led to and attended his conversion are familiar to all readers of the Acts of the Apostles, and need not be recapitulated here. After a solitary sojourn in Arabia—perhaps to calm his perturbed spirit in communion with God, and to solemnly prepare himself for his new mode of life—on his return to Damascus, he changed his name to Paul, and remained or began (it is not quite clear which) his apostolic labours. Naturally, he became an object of intense hostility to the neighbouring Jews in that city. They resolved to kill him; but his friends contrived a way of escape, and he fled to Jerusalem, where at first he was received with suspicion by the disciples, but afterwards, through the kind offices of Barnabas, with great cordiality. He now spoke boldly in the name of Christ, directing also against the "Greeks" (i. e., the Hellenistic Jews—with dangerous success, for his opponents sought to take his life. Again he was obliged to flee, and betook himself to his birthplace, Tarsus, where he seems to have remained till Barnabas brought him to Antioch (not far off), to assist in the great work of evangelization going on in that city. After a short visit to Jerusalem in the year of the famine, A.D. 47, they were set apart by the prophets and elders of the church at Antioch for the evangelization of the more distant Jews. From Seleucia they proceeded on their first missionary expedition to the southern districts of Asia Minor, Pamphylia, Pisidia, and Lyconia, where they met, especially in some places, with considerable success, in preaching the gospel. It is very interesting to notice how gradually the light of Christianity dawned on the mind of the apostle. He did not grasp all at once its grand design. It was not even by abstract reflection that he arrived at it. Circumstances of quite an outward sort forced him to the sudden conclusion of his creed. It was when the Jews of Pisidian Antioch, enraged at his preaching the gospel indiscriminately to their Gentile fellow-townsmen and themselves, "contradicted and blasphemed" him, that he boldly announced Christ as the universal Redeemer. After the return of P. and Barnabas to Antioch, they continued to labour in that city for a long time, till dissenters having arisen about the circumcision of

Gentile converts, he, along with Barnabas and others, was chosen to go up to Jerusalem, to get the opinion of the apostles and elders there on the question, about 51 A.D. P. and Barnabas now returned to Antioch, where they continued to teach and preach, till a yearning grew up in the heart of the former to revisit his Gentile converts in Asia Minor. In his second expedition, P. was accompanied by Silas instead of Barnabas, and traversed the whole of Asia Minor from south to north, evangelising with great success, after which the two missionaries crossed the *Ægean* and landed in Europe, planting at Philippi, the capital of Thracian Macedonia, the first Christian church in that continent. The details of his visits to Thessalonica, Berea, Athens, and Corinth are, doubtless, familiar to our readers, and need not be given here. We can only notice his appearance at Athens, where, on Mars' Hill, before a crowd of the citizens, among whom were Epicurean and Stoic philosophers, he delivered that magnificent discourse in which he declared to the Athenians the character of the 'unknown' God. On his return to Asia Minor he visited Ephesus, where, as usual, he 'reasoned' with the Jews in their synagogue; sailed thence to Cæsarea, in Palestine, and proceeded to Jerusalem 'to keep the feast'; after which he again returned to Antioch, the centre from which his operations radiated. Thus closed his second evangelistic journey.—The third journey of P. commenced probably about 54 A.D., and extended over much the same district as the previous one. At Ephesus, where he remained for a period of two years and three months, his efforts were powerfully seconded by the eloquence of the great Alexandrian convert, Apollos. Here it is recorded (Acts, xix.) that 'God wrought special miracles by the hand of Paul, so that from his body were brought unto the sick handkerchiefs or aprons, and the diseases departed from them, and the evil spirits went out of them.' In explanation of this very curious procedure, which has a disagreeable resemblance to ordinary legerdemain, it has been suggested, that as Ephesus was a city noted for its exorcisms, spells, and incantations—the famous *Ephesia Grammatu* sold at a high price to the ignorant and superstitious populace—this style of miracle was an accommodation to their belief in magic and dæmonism, and intended to shew them, according to their own way of regarding things, the superiority of Christ's power to that of the evil spirits of heathen worship. From Ephesus, P. went up to Jerusalem with a presentiment that heavy evils were about to fall upon him through the ever-maddening malice of the Jews. The Jewish populace were goaded into the wildest fury by the very sight of Paul. The captain of the Roman guard, Clandius Lysias, had to interfere to save him from being torn to pieces; but as forty Pharisees had sworn neither to eat nor drink till they had taken his life, he was sent by night, under a strong escort, to the Roman governor, Felix, at Cæsarea, where he was unjustly detained a prisoner for two years. Having finally appealed to the Roman emperor, according to the privilege of a Roman citizen, he was sent to Rome. On the voyage thither, he suffered shipwreck at Melita (probably Malta), in the spring of 61 A.D. At Rome, he was treated with respect, being allowed to dwell 'for two whole years in his own hired house.' His first thoughts were, as usual, directed towards his Jewish brethren in the city; but, on the whole, he made little impression on them. Whether he ever left the city or not, cannot be positively demonstrated, but it is believed by many critics, from a variety of considerations, that he did obtain his liberty about 64 A.D., and that he made journeys both to the east

and to the west, revisiting Asia Minor, and carrying out his long-cherished wish of preaching the gospel in Spain, then thought to be the western limit of the world. Meanwhile occurred the great and mysterious burning of Rome, generally attributed to Nero. The latter threw the blame on the Christians, who were, in consequence, subjected to a severe persecution. Among the victims was P., who, according to tradition, suffered 67 A.D.—For an account of P.'s correspondence with the churches, see the articles on the different Epistles.

PAUL, the name of five popes, of whom the following appear to call for special notice—PAUL III., whose pontificate falls upon one of the most critical periods in the history of the church, was originally named Alessandro Farnese, and was born at Carino, in Tuscany, in 1468. Having been created cardinal, he served in several important trusts, and eventually became Bishop of Ostia and Dean of the Sacred College. On the death of Clement VII., in 1534, he was elected pope, just at the crisis when the world was alive with expectation of the general council which was to decide all the controversies at that time agitating the public mind of Europe. After some delays, P. convoked the council to meet at Mantua in 1542; but it did not actually assemble (in Trent) until 1545. These delays are by some charged upon P.; but it can hardly be doubted that much of it was due to the difficulties of the times. The bull of excommunication and deposition which he issued in 1538 against Henry VIII. of England, is one of the last examples of the exercise of the temporal power claimed by the medieval popes. In the contest of Charles V. with the Protestant League in Germany, P. sent a large force to support him, and he opposed the pacification proposed by the emperor upon the basis of the *INTERIM* (q. v.). P.'s conduct in aggrandising the fortune of his son, Pietro Luigi Farnese, has been severely criticised by historians; the more so, that this son was born out of wedlock, in the early youth of his father. P. died November 10, 1549, in his 82d year.—PAUL IV., named John Peter Caraffa, a member of the noble family of that name, was born in Naples in 1476. His early career was distinguished for ascetic rigour. He was appointed Bishop of Chieti, in which see he laboured most earnestly for the reformation of abuses, and for the revival of religion and morality. With this view, he established, in conjunction with several congenial reformers, the congregation of secular clergy called *THEATINES* (q. v.), and was himself the first superior. It was under his influence that Paul III. organised the tribunal of the Inquisition in Rome. On the death of Marcellus II. in 1555, although in his seventy-ninth year, he was elected to succeed. He entered upon the wider career of reformation which his new position opened for him with all the ardour of a young man, and with all the stern enthusiasm which had characterised him during life. He enforced vigorously upon the clergy the observance of all the clerical duties, and enacted laws for the maintenance of public morality. He established a censorship, and completed the organisation of the Roman Inquisition; he took measures for the alleviation of the burdens of the poorer classes, and for the better administration of justice, not sparing even his own nephews, whom he banished from Rome, on account of their corrupt conduct and profligate life. His foreign relations, too, involved him in much labour and perplexity. He was embroiled with the Emperor Ferdinand, with Philip II. of Spain, with Cosmo, Grand Duke of Tuscany. Having condemned the principles of the Peace of Augsburg, he protested against its provisions. Under the weight of so many cares, his great age gave way.

He died August 18, 1833, in his 84th year. At his death, the papalists broke out into an insurrectionary tumult, which lasted till the convalescence for the appointment of his successor. — PAUL V., originally named Camillo Borghese, was born in Rome in 1552. In his early life, he was a distinguished economist and theologian, and after the ordinary prelatical career at Rome, he rose first to the post of nuncio at the French court, and afterwards to the cardinalate under Clement VIII. On the death of Leo XI. in 1605, Cardinal Borghese was elected to succeed him. His pontificate is rendered memorable by the celebrated conflict with the republic of Venice, into which he was plunged at the very outset of his career. The original ground of dispute was the question of the immunity from the jurisdiction of civil tribunals conceded to the clergy, who claimed to be tried by ecclesiastical tribunals alone. This claim the senate resisted, and further causes of dispute were added by a maritime law, and a law prohibiting the establishment of new religious orders or associations unless with the sanction of the senate. Each party remaining inflexible in its determination, it lasted a brief, distressing a sentence of excommunication against the dogs and senate, and placing the republic under an interdict unless submission should be made within twenty-four days. The senate persisted, and an animated conflict, as well of acts as of writings ensued, in the latter of which the celebrated Fra Paolo forged, on the side of the republic, and on the papal side, Bellarmine and Bannier, were the leaders. Preparations were even made for actual hostilities; but, by the intervention of Henry IV. of France, the dispute was accommodated, and peace restored in 1607, although quarrels afterwards arose on the subject of the nomination of a patriarch. A misunderstanding of a similar nature arose between the pope and the senate in France as to the rights of censorship on books, and as to the removing of the disciplinary decrees of the Council of Trent; but it was removed by mutual explanations. His administration was rigorous and enlightened, and he did a great deal for the promotion of useful public works, for the embellishment of the city, the restoration and preservation of antiquities, the improvement of the revenues and libraries, and, above all, for the pious and charitable institutions of Rome. P. died in his 84th year, January 23, 1621.

PAUL, Vincent, one of the most eminent names of the modern Catholic Church, was born of humble parents at Haugues, in the diocese of Troy, in the year 1576. The indications of ability which he exhibited led to his being sent to school at Fontenay. He became an ecclesiastical student, and was admitted to priest's orders in 1600. On a voyage which he was making from Marseille to Fontenay, his ship was captured by corsairs, and he with his companions sold into slavery at Tunis, where he passed through the hands of three different masters. The last of these, who was a renegade monk, yielded to the entreaties of Vincent, consented to return to the Christian faith, and with Vincent, made his escape from Barbary. They landed in France in 1607. Having gone thence to Rome, he was entrusted with an important mission to the French court in 1608, and continued for some time to reside in Paris as the almoner of Marguerite de Valois. The accident of his becoming preceptor of the children of M. de Hurty, the commandant of the galleys at Marseille, led to his being appointed almoner-general of the galleys in 1619. It was at this time that the well-known incident occurred of his offering himself, and being accepted, in the place of one of the convicts, whom he found overwhelmed with guilt and despair at having been obliged to

leave his wife and family in extreme destitution. Meanwhile he had had the foundation of what eventually grew into the great and influential congregation of Priests of the Mission; an association of priests who devote themselves to the work of assisting the parished clergy by preaching and hearing confessions periodically in those districts to which they may be invited by the local pastors. The rules of this congregation were finally approved by Urban VIII. in 1625, and in the following year the Fathers established themselves in the so-called Priory of St. Lazare, in Paris, whence their name of Lazarists is derived. From this date, his life was devoted to the opposition of works of charity and benevolence. To him Paris owes the establishment of the Foundling Hospital, and the first systematic efforts for the preservation of the lyres, and the due attention of a class theretofore neglected, as left to the operation of chance charity. The spirit of the Fatherland of Charity is an emanation of the same spirit, and Vincent was interested by St. Francis of Sales with the direction of the newly founded order of Sisters of the Visitation. Two years, Anne of Austria, warmly received his exertions, and Louis XIII. chose him as his favored assistant in his last illness. He was placed by the queen-regent at the head of the *Congrès de Clermont*, the council chiefly charged with the direction of the crown in ecclesiastical affairs; and the period of his presidency was long looked back to as the golden era of impartial and honest distribution of ecclesiastical patronage in France. Vincent was not, in any sense of the word, a scholar, but his preaching, which like that of the Fathers of his congregation of Lazarists was of the most simple kind, was singularly affecting and impressive. He felt nothing belied him but the *Rules or Constitutions of the Congregation of the Mission*, 1658; *Conférences on these Constitutions*, etc.; and a considerable number of letters, chiefly addressed to the priors of the mission, or to other friends, on spiritual subjects. He died at the advanced age of 53, at St. Lazare, September 27, 1650, and was canonized by Clement XII. in 1737. His festival is held on the 19th July, the day of his canonization.

PAUL (Peterwroten), Emperor of Russia, the second son of the unfortunate Peter III. and the Empress Catharine II., was born in 1754, became heir-apparent on the death of his elder brother in 1763, and succeeded his mother on the imperial throne in 1796. The tragical death of his father when he was still a child, and the neglect and want of confidence with which his mother treated him, exerted a baneful influence on the character of P., who was kept in compulsory seclusion while Catharine shared the administration of the government with her favorites. In 1776, P., on the death of his first wife, a princess of Hesse-Darmstadt, married the Princess Dorothea of Württemberg, by whom he had four sons—the late Emperors Alexander and Nicholas, and the Grand Duke Constantine and Michael, and several daughters. After spending some years in travelling with his wife through Germany, France, and Italy, P. was recalled by his mother, who assigned to him the palace of Gatchina, 30 miles from St. Petersburg, as his settled residence, while she took his children under her own immediate care. The death of the empress in 1796 released him from his unnatural restraint, and he ascended the throne with no practical acquaintance with the mechanism of government, and no knowledge of the people whom he was called to rule over. A determination to change everything that had existed under the previous reign, and to wreak vengeance on the nobles of his father, were the predominating influences that

guided his actions; and his earliest measures, which were the disgrace of his father's murderers, and the pardon of all Polish prisoners, gave hopes of a good reign; but the capricious violence of character and incapacity for business which P. betrayed, soon disappointed the hopes that he had awakened. No department of the state was free from his frivolous interference, and no class of the nation exempt from the effect of his arbitrary legislation. While he irritated the soldiery by vexatious regulations in regard to their dress, he offended the nobles by imperious enactments as to the ceremonials to be observed in his presence. His foreign policy was marked with similar caprice. After having adopted a system of neutrality in the war between France and the rest of Europe, he suddenly declared in favour of the allied powers, and sent an army of 66,000 men under Suwaroff into Italy. The success of his general encouraged him to send a second army of equal strength to co-operate with the Austrians; but their defeat in 1799 induced P. to recall Suwaroff with the Russian troops; and having retired from the allied coalition without having given any reason for his conduct, he quarrelled with England, because she would not comply with his whimsical demand for the surrender of Malta, and his own recognition as Grand Master of the Order of Malta, and entered into a close alliance with Bonaparte, who was then First Consul. The jealousy and hatred of England by which both were actuated, proved a powerful bond of union between them; and in furtherance of their scheme of uniting all the smaller maritime powers into one vast confederation against England, P. concluded a convention with Sweden and Denmark for the purpose of opposing the right insisted on by England of searching neutral vessels. The result was that the English government sent a fleet into the Baltic under Nelson to dissolve the coalition, at the close of March 1801. P. was preparing to give material aid to the Danes, when a conspiracy was formed at St Petersburg to put a stop to the capricious despotism under which all classes of men in Russia were groaning. The conspirators, whose numbers included Count Pahlen, the most influential man at court, General Beningsen, Uwarow, and many other distinguished nobles and officers, appear originally to have intended only to force P. to abdicate, but his obstinate disposition led to a scuffle, in which the emperor was strangled, March 24, 1801.

PAULDING, JAMES KIRKE, an American author, was born at Pleasant Valley, New York, August 22, 1779. His father was a farmer, descended from the early Dutch settlers. Self-educated, and early developing a tendency to literature, he was a friend of Washington Irving, and wrote a portion of *Salmagundi*. During the war of 1812, he published the *Diverting History of John Bull and Brother Jonathan*; in 1813, a parody of the *Lay of the Last Minstrel*, entitled *A Lay of the Scottish Fiddle*; and in 1814, a more serious work, *The United States and England*, a defence against articles in the *Quarterly Review*. This work attracted to him the attention of President Madison, and caused him to be appointed a member of the Board of Naval Commissioners. In 1817, he published a defence of the southern states and of slavery in *Letters from the South, by a Northern Man*; in 1819, a new series of *Salmagundi*; in 1822, *A Sketch of Old England, by a New England Man*; and in 1824, *John Bull in America, or the New Munchausen*, a satire on the writings of certain British tourists. This was followed by *Königsmarke*, a novel (1825); *Merry Tales of the Three Wise Men of Gotham* (1826); *The New Pilgrim's Progress* (1828); *Tales of a Good Woman* (1829); *Book of St Nicholas* (1830). These

works, mostly humorous and satirical, had various degrees of local popularity; but in 1831 he produced *The Dutchman's Fireside*, a novel that was reprinted in England, and translated into French and Dutch; and in 1832, *Westward Ho!* which attained to a similar popularity. These were followed by a *Life of Washington* (1835), *Slavery in the United States* (1836), in which the institution is defended on social, economical, and physiological grounds. He held at this period the lucrative post of Navy Agent at New York, and was by Mr Van Buren appointed Secretary of the Navy, which gave him the position of cabinet minister. At the close of Mr Van Buren's presidency in 1841, Mr P. retired to a country residence at Hyde Park, New York, where he wrote *The Old Continental*, a novel (1846); *The Puritan and his Daughter* (1849); and with his son, a volume of *Plays and Fairy Tales*. He died at Hyde Park, April 6, 1860.

PAULICIANS, an ancient sect of the Eastern Empire, who, by Catholic writers, are reckoned an offshoot of the Manicheans (q. v.). According to Peter of Sicily and Photius, the sect originated in Armenia from two brothers, named Paul (from whom it is alleged to have received its name) and John, who flourished in the 4th century. Others trace it to an Armenian named Paul, who lived under Justinian II. The P. were at all times treated with much suspicion, and repressed with great severity, by the eastern emperors; Constantine, Justinian II., and Leo the Isaurian especially laboured to repress them, and indeed, with the exception of Nicephorus Logotheta (802–811), it may be said that all the emperors, with more or less rigour, persecuted them. Their greatest enemy, however, was Theodora (841–855), who, having ordered that they should be compelled to return to the Greek Church, had all the recusants cruelly put to the sword or driven into exile. A bloody resistance, and finally an emigration into the Saracen territory, was the consequence; and it is from the Paulician settlers in Bulgaria (Catholic historians) that the Manichean doctrines which tinged the opinions of most of the medieval sects, are supposed by Roman Catholic historians to have found their way into the eastern provinces of the Western Empire. Even so late as the 17th c., according to Mosheim (ii. 238), there was a remnant of this sect existing in Bulgaria.

It is proper, however, to notice that a very different view of the character and doctrines of the P. has been advocated by such modern writers on ecclesiastical history as Gieseler and Neander, according to whom they had their origin from one Constantine of Mananalis (near Samosata), an Armenian, who had received a present of two volumes—one containing the four gospels, and the other the epistles of Paul—and who afterwards assumed the name of Paul, in testimony of his great veneration for that apostle. The distinctive characters of his doctrine and that of his followers were the rejection of the worship of the Virgin, the saints, and the cross, the denial of the material presence of Christ in the Eucharist, and the assertion of a right freely to search the Scriptures; and the charge of Manichæism was falsely brought against them by their persecutors.

PAULLINIA. See GUARANA BREAD.

PAUL'S (ST) CATHEDRAL in London is noted from its being the largest and most magnificent Protestant church in the world, and second only to St Peter's in Rome among the religious structures of modern times. The site of the present building was occupied about 610 by a Christian church dedicated to St Paul. This church continued till 1083, when it

was destroyed by fire. From its ruins arose a much more splendid edifice. The immediate precursor of the present edifice. In 1137, the building suffered severely from fire; but, that being the great age for splendid churches, it was soon restored with great magnificence, the bishops and the people contributing most liberally to defray the cost. Old St Paul's was the largest church in the country, being 630 feet in length, 100 in breadth, and about 100 feet high. The total height of the stone tower and the spire, covered with lead, which surmounted it, was 200 feet. The cloister was 90 feet square, with a beautiful chapter-house in the centre. In 1090, the great fire of London completely destroyed the old cathedral, along with a large portion of the city and most of the churches, and Herulfus, Bishop of Exeter, was employed to design about 50 of the new churches, and, among others, the new cathedral. In 1075, he submitted several designs for a new cathedral to the king, who selected one, and ordered a model of it on a large scale to be prepared. This was done by Wren, and the model still exists. The plan is in the form of a Greek cross, having a large dome over the centre, supported on solid arches. This was, however, eventually discarded, and the new design was modelled on that of a Gothic cathedral, with an interior length of 400 feet, width 240 feet across transepts, and a nave 94 feet wide. The dome and the eight supporting arches of the model are preserved; but in the new design the eight arches lead to no massive compartment, but to small dark passages only; while the upper portions of these great arches are filled up with other arches, introduced for constructive purposes, but very destructive of the architectural effect. The plan of supporting the dome on eight arches had the charm of novelty, and also of simplicity of construction, but it made the dome themselves too small in proportion to the rest of the church. The constructive skill displayed by Wren in this building is universally acknowledged and admired, but it is thought that he has allowed the mechanical exigencies of the work to interfere too much with its decorative requirements. The dome, for example, is constructed on a new and most masterly principle, the thrust of the vault being counterbalanced by the weight of a brick wall, which is carried up to support the stone lantern over the exterior dome. But in order to carry this out with the least expenditure, the drum or plain cylindrical wall under the dome, is sloped inwards, so that the interior with which it is decorated appear to the spectator below to be falling inwards, thus producing a painful and disagreeable effect. Great triumph is taken in the fact, that the exterior dome is of wood, and not of stone, and so liable to premature decay, but the dome may be said of the modernists over the ruins of Gothic cathedrals; and by making it of wood, for Christopher was obliged to pass it to a height which makes it one of the noblest buildings of the kind in the world. The design of the nave, from the classic vaulting and what it is covered, is necessarily to a great extent a failure. When domes, or interesting vaults, are used in a classic building, the compartments need be almost square; there can therefore be but a small number of nave piers, as compared with those of a Gothic cathedral, and the perspective effect of the latter is thus entirely wanting. The same is the case at St Peter's. The dome is particularly successful, and is admitted to be the finest in existence; no other being so graceful and varied in effect, and yet so massive in general effect. Its height from the pavement to the top of the cross is 94 feet. The west front, as seen from Ludgate

Hill, is most striking; the two semicircular groups most harmoniously with the dome, and, together with the portico, produce a most pleasing and remarkable effect. This front must, however, be considered, along with the seven walls, if severely criticised. The upper portion appears to indicate an upper story where there is none, and the actual construction and true form of the building are not expressed at all. St Paul's is the burial-place of many heroes and men of distinction, whose tombs are in the crypt, and whose monuments adorn the interior of the cathedral. Amongst these are Nelson and Wellington, Collingwood, Abercromby, Moore, Howe, St Vincent, Paken, Rodney, and many other celebrated soldiers and sailors; Howard, Johnson, Reynolds, Barry, Opie, Wink, Astley, Paken, Sir William Jones, Sir Christopher Wren, and other distinguished civilians. Several of the monuments are by Flaxman, Chantrey, Banno, and Rossi; but it must be confessed that they savour considerably of heathen mythology, to be appropriate in a Christian cathedral.

PAULUS AEGINETA, a celebrated Greek physician, was born in the island of Euboea, and flourished during the conquests of the Calif Omar in the 7th century. Of his life we know almost nothing more than that he pursued his medical studies first at Alexandria, and afterwards in Greece and other countries. His forte lay in surgery and obstetrics, in the latter of which departments of medicine his position was great. He studied the works of Galen, and was deeply read in those of Aetius and Oribasius, while he always exercised an independent judgment in forming his conclusions. His descriptions of diseases are brief and succinct, and also complete and exact. He often grounds his explanation of morbid phenomena on Galen's theory of the cardinal humours; while in surgery his writings abound with novel and ingenious views. His works—the principal of which is commonly called *De Re Medica Libri Septem* (Lond. 1554)—have passed through many editions, of which the best is that completed at Lyon in 1567, and they have also had many translators, of whom the best in English is Dr Francis Adams.

PAULUS DIACONUS (also called PARRIS LEYRA, both surnames being derived from his ecclesiastical office), one of the most learned men of his time, and the greatest Lombard historian, was born of a noble Lombard family at Friuli about 750. His father's name was Warnefrid. He received a superior education at Pavia, at the court of the Lombard king Ratchis, and appears to have continued at court during the reigns of his successors, Aistulf and Desiderius, and to have accompanied Adelgerus, the daughter of Desiderius, whose education he had conducted, to the court of her husband, Duke Arichis of Beneventum. For her he wrote, in 781, after he had become an ecclesiastic, one of his principal works, his *Historia Romana*, a work of no authority, as it is a mere compilation from works which we possess, but which was greatly used during the whole of the middle ages, as the many manuscripts, recensions, and continuations of it, attest. An edition of the genuine text is still wanting, but a great part of it is given in Muratori's *Scriptores Italici*, vol. 1 (Milan, 1729). In 781, P. became a monk of Monte Cassino; but afterwards went to France, and won the esteem of Charlemagne to a high degree by his character and learning. He aided that monarch in his schemes for the promotion of learning, and introduced the study of the Greek language into France. He made a collection of homilies from the best sources, at the emperor's desire, known as the *Homologues*, often

guided his actions; and his earliest measures, which were the disgrace of his father's murderers, and the pardon of all Polish prisoners, gave hopes of a good reign; but the capricious violence of character and incapacity for business which P. betrayed, soon disappointed the hopes that he had awakened. No department of the state was free from his frivolous interference, and no class of the nation exempt from the effect of his arbitrary legislation. While he irritated the soldiery by vexatious regulations in regard to their dress, he offended the nobles by imperious enactments as to the ceremonials to be observed in his presence. His foreign policy was marked with similar caprice. After having adopted a system of neutrality in the war between France and the rest of Europe, he suddenly declared in favour of the allied powers, and sent an army of 56,000 men under Suwaroff into Italy. The success of his general encouraged him to send a second army of equal strength to co-operate with the Austrians; but their defeat in 1799 induced P. to recall Suwaroff with the Russian troops; and having retired from the allied coalition without having given any reason for his conduct, he quarrelled with England, because she would not comply with his whimsical demand for the surrender of Malta, and his own recognition as Grand Master of the Order of Malta, and entered into a close alliance with Bonaparte, who was then First Consul. The jealousy and hatred of England by which both were actuated, proved a powerful bond of union between them; and in furtherance of their scheme of uniting all the smaller maritime powers into one vast confederation against England, P. concluded a convention with Sweden and Denmark for the purpose of opposing the right insisted on by England of searching neutral vessels. The result was that the English government sent a fleet into the Baltic under Nelson to dissolve the coalition, at the close of March 1801. P. was preparing to give material aid to the Danes, when a conspiracy was formed at St Petersburg to put a stop to the capricious despotism under which all classes of men in Russia were groaning. The conspirators, whose numbers included Count Pahlen, the most influential man at court, General Beningsen, Uwarow, and many other distinguished nobles and officers, appear originally to have intended only to force P. to abdicate, but his obstinate disposition led to a scuffle, in which the emperor was strangled, March 24, 1801.

PAULDING, JAMES KIRKE, an American author, was born at Pleasant Valley, New York, August 22, 1779. His father was a farmer, descended from the early Dutch settlers. Self-educated, and early developing a tendency to literature, he was a friend of Washington Irving, and wrote a portion of *Salmagundi*. During the war of 1812, he published the *Disarming History of John Bull and Brother Jonathan*; in 1813, a parody of the *Lay of the Last Minstrel*, entitled *A Lay of the Scottish Fiddle*; and in 1814, a more serious work, *The United States and England*, a defence against articles in the *Quarterly Review*. This work attracted to him the attention of President Madison, and caused him to be appointed a member of the Board of Naval Commissioners. In 1817, he published a defence of the southern states and of slavery in *Letters from the South, by a Northern Man*; in 1819, a new series of *Salmagundi*; in 1822, *A Sketch of Old England*, by a *New England Man*; and in 1824, *John Bull in America, or the New Munchausen*, a satire on the writings of certain British tourists. This was followed by *Kontagmarke*, a novel (1825); *Merry Tales of the Three Wise Men of Gotham* (1826); *The New Pilgrim's Progress* (1828); *Tales of a Ghost Woman* (1829); *Book of St Nicholas* (1830). These

works, mostly humorous and satirical, had various degrees of local popularity; but in 1831 he produced *The Dutchman's Fireside*, a novel that was reprinted in England, and translated into French and Dutch, and in 1832, *Westward Ho!* which attained a similar popularity. These were followed by a *Life of Washington* (1835), *Slavery in the United States* (1836), in which the institution is defended on social, economical, and physiological grounds. He held at this period the lucrative post of Navy Agent at New York, and was by Mr Van Buren appointed Secretary of the Navy, which gave him the position of cabinet minister. At the close of Mr Van Buren's presidency in 1841, Mr P. retired to a country residence at Hyde Park, New York, where he wrote *The Old Continentals*, a novel (1846); *The Puritan and his Daughter* (1849); and with his son, a volume of *Plays and Fairy Tales*. He died at Hyde Park, April 6, 1860.

PAULICIANS, an ancient sect of the Eastern Empire, who, by Catholic writers, are reckoned as offshoot of the Manicheans (q.v.). According to Peter of Sicily and Photius, the sect originated in Armenia from two brothers, named Paul (from whom it is alleged to have received its name) and John, who flourished in the 4th century. Others trace it to an Armenian named Paul, who lived under Justinian II. The P. were at all times treated with much suspicion, and repressed with great severity, by the eastern emperors, Constantine, Justinian II., and Leo the Isaurian especially, who endeavored to repress them, and indeed, with the exception of Nicephorus Logotheta (802—811), it may be said that all the emperors, with more or less success, persecuted them. Their greatest enemy, however, was Theodora (841—855), who, having ordered that they should be compelled to return to the Greek church, had all the recusants cruelly put to the sword or driven into exile. A bloody resistance, and thus an emigration into the Saracen territory, was the consequence; and it is from the Paulician sect in Bulgaria (Catholic historians) that the Manichean doctrines which tinged the opinions of some of the medieval sects, are supposed by Roman Catholic historians to have found their way to the eastern provinces of the Western Empire. Even so late as the 17th c., according to Mehus (ii. 238), there was a remnant of this sect existing in Bulgaria.

It is proper, however, to notice that a very different view of the character and doctrine of the P. has been advocated by such writers on ecclesiastical history as Gieseler and Neander, according to whom they had their origin from one Constantine of Mananalis (near Samaria), an Armenian, who had received a present of two volumes—one containing the four gospels, and the other the epistles of Paul—and who afterwards assumed the name of Paul, in testimony of his veneration for that apostle. The distinctive characters of his doctrine and that of his followers were the rejection of the worship of the Virgin, of saints, and the cross, the denial of the real presence of Christ in the Eucharist, and the assertion of a right freely to search the Scriptures, and the charge of Manichæism was falsely brought against them by their persecutors.

PAULLINIA. See GUARANA BREKAD.

PAUL'S (ST) CATHEDRAL in London is remarkable from its being the largest and most magnificent Protestant church in the world, and second only to Peter's in Rome among the religious structures of modern times. The site of the present building was occupied about 610 by a Christian church dedicated to St Paul. This church continued till 1083, when

was destroyed by fire. From its ruins arose a much more splendid edifice—the immediate precursor of the present cathedral. In 1137, the building suffered severely from fire; but, that being the great age for splendid churches, it was soon restored with great magnificence, the bishops and the people contributing most liberally to defray the cost. Old St Paul's was the largest church in the country, being 690 feet in length, 130 in breadth, and about 160 feet high. The total height of the stone tower and the spire, covered with lead, which surmounted it, was 520 feet. The cloister was 90 feet square, with a beautiful chapter-house in the centre. In 1666, the great fire of London completely destroyed the old cathedral, along with a large portion of the city and most of the churches; and thereafter, Sir Christopher Wren was employed to design about 50 of the new churches, and, among others, the new cathedral. In 1673, he submitted several designs for a new cathedral to the king, who selected one, and ordered a model of it on a large scale to be prepared. This was done by Wren, and the model still exists. Its plan is in the form of a Greek cross, having a large dome over the centre, supported on eight arches. This was, however, eventually departed from; and the new design was modelled on that of a Gothic cathedral, with an interior length of 460 feet, width 240 feet across transepts, and a nave 94 feet wide. The dome, and the eight supporting arches of the model, are preserved; but in the new design the angle arches lead to no spacious compartment, but to small dark passages only: while the upper portions of these great arches are blocked up with other arches, introduced for constructive purposes, but very destructive of the architectural effect. The plan of supporting the dome on eight arches had the charm of novelty, and also of simplicity of construction, but it made the arches themselves too small in proportion to the great span of the dome. The constructive skill displayed by Wren in this building is universally acknowledged and admired, but it is thought that he has allowed the mechanical exigencies of the work to interfere too much with its decorative requirements. The dome, for example, is constructed on a new and most masterly principle, the thrust of the vault being counterbalanced by the weight of a brick cone, which is carried up to support the stone lantern over the exterior dome. But in order to carry this out with the least expenditure possible, the drum, or plain cylindrical wall under the dome, is sloped inwards, so that the columns with which it is decorated appear to the spectator below to be falling inwards, thus producing a painful and disagreeable effect. Great exception is taken to the fact, that the external dome is of wood, and not of stone, and so liable to premature decay; but the same may be said of the wooden roofs over the vaults of Gothic cathedrals; and by making it of wood, Sir Christopher was enabled to raise it to a height which makes it one of the noblest buildings of the kind in the world. The design of the nave, from the classic vaulting with which it is covered, is necessarily to a great extent a failure. When domes, or intersecting vaults, are used in a classic building, the compartments must be about square; there can therefore be but a small number of nave piers, as compared with those of a Gothic cathedral, and the perspective effect of the latter is thus entirely wanting. The same is the case at St Peter's. The dome is particularly successful, and is admitted to be the finest in existence; no other being so graceful and varied in outline and yet so massive in general effect. Its light from the pavement to the top of the cross is 64 feet. The west front, as seen from Ludgate

Hill, is most striking; the two campaniles group most harmoniously with the dome, and, together with the portico, produce a most pleasing and remarkable effect. This front must, however, be condemned, along with the screen-walls, if strictly criticised. The upper portico appears to indicate an upper story where there is none, and the actual construction and true form of the building are not expressed at all. St Paul's is the burial-place of many heroes and men of distinction, whose tombs are in the crypt, and whose monuments adorn the interior of the cathedral. Amongst these are Nelson and Wellington, Collingwood, Abercromby, Moore, Howe, St Vincent, Picton, Rodney, and many other celebrated soldiers and sailors; Howard, Johnson, Reynolds, Barry, Opie, West, Astley Cooper, Sir William Jones, Sir Christopher Wren, and other distinguished civilians. Several of the monuments are by Flaxman, Chantrey, Bacon, and Rossi; but it must be confessed that they savour generally too much of heathen mythology, to be appropriate in a Christian cathedral.

PAULUS ÆGINETA, a celebrated Greek physician, was born in the island of Ægina, and flourished during the conquests of the Calif Omar in the 7th century. Of his life we know almost nothing more than that he pursued his medical studies first at Alexandria, and afterwards in Greece and other countries. His forte lay in surgery and obstetrics, in the latter of which departments of medicine his practice was great. He abridged the works of Galen, and was deeply read in those of Ætius and Oribasius, while he always exercised an independent judgment in forming his conclusions. His descriptions of diseases are brief and succinct, and also complete and exact. He often grounds his explanation of morbid phenomena on Galen's theory of the cardinal humours; while in surgery his writings abound with novel and ingenious views. His works—the principal of which is commonly called *De Re Medica Libri Septem* (Lond. 1834)—have passed through many editions, of which the best is that completed at Lyon in 1567, and they have also had many translators, of whom the best in English is Dr Francis Adams.

PAULUS DIACONUS (also called PAULUS LEVITA, both surnames being derived from his ecclesiastical office), one of the most learned men of his time, and the greatest Lombard historian, was born of a noble Lombard family at Friuli about 730. His father's name was Warnefrid. He received a superior education at Pavia, at the court of the Lombard king Ratchis, and appears to have continued at court during the reigns of his successors, Aistulf and Desiderius, and to have accompanied Adelperga, the daughter of Desiderius, whose education he had conducted, to the court of her husband, Duke Arichis of Beneventum. For her he wrote, in 781, after he had become an ecclesiastic, one of his principal works, his *Historia Romana*, a work of no authority, as it is a mere compilation from works which we possess, but which was greatly used during the whole of the middle ages, as the many manuscripts, recensions, and continuations of it, attest. An edition of the genuine text is still wanting, but a great part of it is given in Muratori's *Rerum Italicarum Scriptores*, vol. 1 (Milan, 1728). In 781, P. became a monk of Monte Casino; but afterwards went to France, and won the esteem of Charlemagne in a high degree by his character and learning. He aided that monarch in his schemes for the promotion of learning, and introduced the study of the Greek language into France. He made a collection of homilies from the best sources, at the emperor's desire, known as the *Homiliarium*, often

printed between 1482 and 1569, and translated into German and Spanish. At the request of Angilram, Bishop of Metz, he also wrote a history of the Bishops of Metz, *Gesta Episcoporum Mettensium* (printed in Pertz's *Monumenta Germanica Historica*, vol. 2), the first work of the kind on the north of the Alps, but the example of which was soon very generally followed. In 787, he returned to his convent, where he remained till his death, which is said to have taken place in 797. In the latter years of his life, he wrote his History of the Longobards (*De Gestis Langobardum*, Libri 6), but did not live to complete it, bringing down the history only to the death of Liutprand in 744. There are several editions of this work, the best of which is contained in the work of Muratori. It is characterised by remarkable candour, and a style unusually pure for that age. The high repute in which this work also was long held, is attested by the great number of manuscripts and continuations. P. was likewise the author of a number of theological works, and of some hymns and letters still extant.

PAULUS, HEINRICH EBERHARD GOTTLOB, a German theologian of great note in his day, and one of the leaders of the Rationalists at the close of the last and the first quarter of the present century, was born at Leonberg, near Stuttgart, 1st September 1761. He gave himself to the study of oriental languages at Göttingen, and afterwards prosecuted it in London and Paris. In 1789, he was called to the professorship of Oriental Languages at Jena, and in 1793 became Professor of Geology, on the death of Döderlein. Here he especially signalled himself by the critical elucidation of the Scriptures of the Old and New Testament, in so far as they presented oriental characteristics. The results of his labours may be seen in his *Philologisch-kritischen und historischen Commentar über das Neue Testament* (4 vols. Lüb. 1800—1804); *Clavis über die Psalmen* (Jena, 1791); *Clavis über den Jesaias*, and other writings belonging to this period of his literary activity. In 1803, he removed to Würzburg; in 1808, to Bamberg; in 1809, to Nürnberg; and in 1811, to Ansbach. During these various changes, he had ceased to be a professor, and become a director of ecclesiastical and educational affairs; but in 1811 he accepted the professorship of Exegesis and Ecclesiastical History at Heidelberg. In 1819, he started a kind of historico-political journal entitled *Sophronion*, in which he continued to write for about ten years. His contributions were marked by weighty sense, moderation, and knowledge of his various subjects, and won him great applause at the time. As a theologian, he is generally looked upon as the type of pure unmitigated rationalism—a man who sat down to examine the Bible with the profound conviction that everything in it represented as supernatural was only natural or fabulous, and that true criticism consisted in endeavouring to prove this. From his numerous writings, we select for mention the following: *Memorabilien* (Leip. 1791—1796); *Sammlung der merkwürdigsten Reisen in den Orient* (7 vols. Jena, 1792—1803); *Leben Jesu, als Grundlage einer reinen Geschichte des Christenthums* (2 vols. Heidelb. 1828); *Aufklärende Beiträge zur Dogmen-Kirchen- und Religionsgeschichte* (Bremen, 1830); and *Exegetisches Handbuch über die drei ersten Evangelien* (3 vols. Heidelb. 1830—1833). P. died 10th August 1851, at the advanced age of 90—having lived long enough to see his own rationalistic theory of Scripture give place to the 'mythical' theory of Strauss, and that in its turn to be shaken to its foundations partly by the efforts of the Tübingen school, and partly by those of Neander and the 'Broad Church' divines of Germany. See P.'s *Skizzen aus meiner Bildungs- und Lebensgeschichte*

zum Andenken an mein 50-jähriges Jubiläum (Heidelb. 1839), and Reichlin Meldegg's *H. E., G. Paulus und Seine Zeit* (2 vols. Stuttg. 1853).

PAUPER COLONIES are establishments at Frederikssoord and Veenhuizen in the Netherlands, province of Drenthe, and at Willemsoord and Ommerschans in Overijssel. They were erected by a benevolent society for the purpose of employing poor people in cultivating land and various industries. In 1858, the society suspended payments, and the state took the temporary management, arranged with the creditors, finally retaining Ommerschans and Veenhuizen, leaving Frederikssoord and Willemsoord to be governed by the society.

On 1st January 1860, the government colonies contained 6034 persons, of whom 4407 had been beggars. There were 41 farms, 15 factories and workshops, with churches and schools. The stock consisted of 104 horses, 508 cows, 1259 sheep, &c., and the breadth of land in culture extended to 1454 acres in rye, barley, oats, and buckwheat, 741 in potatoes, and 1124 in grass. Peat is extensively cut; half a million coffee-bags are made annually, &c. These institutions are kept up at a considerable expense to the nation, but have been successful in reducing the numbers and improving the social condition of many of the destitute poor.

The colonies of the benevolent society extend to 4942 acres, and the inhabitants are either tenant cottagers, with about 7 acres of land attached to each house, or labour for the society. In 1863, there were 259 cottager families, paying for house, garden, land, and the use of a cow, a yearly rent of about £5, 17s. Those who are not required for the land, work in the factories, weaving cottons, bagging, coarse linens, making baskets, mats, &c. There are two Protestant churches, a Roman Catholic chapel, and a synagogue. The society's colonies have never been self-supporting, and are partly maintained by the yearly contributions of members, gifts, legacies, &c.; the total receipts, from all sources, in 1862, amounting to £37,000, and the expenditure to £34,000. Pop. 2611. In 1863, there were 5079 members who contributed £1378; and the property, stock, &c., of the society are valued at £74,000. The colonists have been greatly improved in position, and their houses shew signs of industry and comfort. When working in the factories, a tenth part of their weekly earnings is placed in a reserve fund, which is paid out to them in winter or in time of sickness.

PAUSANIAS, a famous Spartan regent and general, the son of Cleombrotus, and nephew of Leonidas. He commanded the confederate Greeks in the important battle of Plataea (479 B.C.), in which the Persians were totally routed, and their leader, Mardonius, slain. He then marched his troops against Thebes, and compelled the inhabitants to give up the chiefs of the Persian party to him for punishment. Elated by this victory, however, he became in an extreme degree haughty and vain-glorious, took all the credit to himself, and allowed none to the Athenian generals, Aristides and Kimon, who commanded under him, and treated all the other Greeks as if the Spartans were their lords. Nevertheless, he still continued his conquests, capturing Cyprus and Byzantium. It was here he first began to play false to Greece. He entered into secret negotiations with Xerxes, with the view of becoming ruler, under the Persian monarch, of the whole country, and in his journey through Thrace, even adopted the dress and luxurious habits of a Persian satrap, and surrounded himself with a body-guard of Persians and Egyptians. Being recalled, on account of these things, by the Spartans, his former

services procured his acquittal. He then returned to Byzantium, where he renewed his traitorous intrigues, was expelled from the city for a criminal assault upon a Byzantine lady, withdrew to the Troad, and there continued his treachery. He was a second time called to account by the Spartan ephors, but again escaped, though with greater difficulty. Yet his passion for the sovereignty of Greece, even though at the expense of the national liberties, once more drove him to play the traitor. He tried to stir up the Helots, but was taken in his own net. A Helot betrayed him. When P. found his position desperate, he took refuge in a temple of Athena. Hereupon the people blocked up the gate of the temple with heaps of stones, and left him to die of hunger, his own mother depositing the first stone.

PAUSANIAS, one of the most eminent of Greek geographers and historians, was probably a native of Lydia in Asia Minor, and was born some time in the 2d century. He travelled through almost all Greece, Macedonia, and Italy, and also through part of Asia and Africa, and composed from his observations and researches an Itinerary, entitled *Huados Periegesis*, in ten books, describing the different parts of Greece, and giving a particular account of the monuments of art and of the legends connected with them. His style is by no means pure; but in matters of his own observation he is most trustworthy, and his work is, on many subjects, one of the most valuable sources of information that we possess. There are numerous editions of his work; the oldest was printed at Venice in 1516 by Aldus; and the most recent is that by J. H. C. Schubart and C. Walz (3 vols. Lep. 1838—1840). Translations of P. exist in English, German, and French.

PAVEMENT, flat stones or 'flags' used for the flooring of halls, kitchens, and other apartments, and frequently for footpaths; also the stone covering of the roadway of streets. The stones used for flags vary in different districts, according to the geological formation of the neighbourhood. The pavements now most commonly used in England and Scotland are the Arbroath and Caithness stones—the former a finer and more agreeable stone than the latter, which is exceedingly hard and slippery when wet. Pavement should be carefully laid on a solid dry foundation, and set in a good bed of concrete or mortar, and the joints pointed with cement. It may also be laid on small dwarf walls, built of brick, in order to support all the edges—this is a good method in keeping the floor dry.

THE PAVING OF STREETS is of early date, and is, in fact, necessary to any considerable degree of civilisation and traffic. The Romans paved their streets in the same elaborate and solid manner in which they paved their highways. See ROADS. Portions of the ancient pavement of the streets of Rome are in use to the present day, and the pavement of Pompeii remains entire. It is laid with large blocks of stone of polygonal shape (like Cyclopaean masonry), very carefully fitted together, and of considerable depth, and below there is a carefully prepared basis, often composed of several distinct strata. Some of the Italian towns—Florence, for instance—have still pavement of this description, and no foot-pavement.

The medieval cities were almost all unpaved till about the 12th c., when the main streets of the chief towns began to be protected with stone. The plan now adopted is nearly the same in all the cities of Europe. The first thing to be done is to secure or make a solid foundation. This is done, where the natural substratum is not of a solid kind,

by laying the street with a solid bed of concrete, having a slope from the middle to the sides to throw off the water. On the concrete is placed the real pavement, which is composed of blocks of granite, trap, or other tough rock. These should be rectangular, and the deeper the better. They are generally about 10 inches to 12 inches in depth, and 6 inches or 7 inches broad, and from 1 to 2 feet in length. They should be all bedded and jointed in strong mortar. This is not often done, as it is thought sufficient to bed the stones in sand, and grout them with hot lime on the top. It is clear, however, that the more equal the stones are in depth, and the more solidly they are bedded, the longer they will last. Other materials besides stone have been tried for the paving of streets—such as blocks of wood with the end up, and blocks of cast iron. The wooden pavement is delightfully easy, and not noisy, but in wet weather it is exceedingly slippery. Cast-iron is too hard, and causes too much jolting and noise.

The great obstacle in the way of really good pavement in modern streets is the necessity of frequently breaking it up for the laying and repairing of pipes for gas, water, &c. The true remedy—and, in the end, the cheapest—would be to have, in the chief streets at least, sub-ways or tunnels for drains and pipes, accessible without breaking up the pavement.

PA'VIA, a city of Northern Italy, capital of the province of the same name, on the left bank of the Ticino, 20 miles south of Milan, and 3 miles above the confluence of the Ticino and the Po. A covered bridge of eight arches connects the city with the suburb of *Borgo Ticino*, on the right bank of the river, and from this bridge the *Strada Nuova*, or *Corso*, the principal thoroughfare, leads north, and extends to the outskirts. The city is large, surrounded by walls, and has an imposing appearance, bearing the impress of antiquity. In former times, it was called the 'city of a hundred towers;' but the palace of Theodorico, and the tower where Boethius wrote the treatise *De Consolatione Philosophiæ*, no longer exist; among the remaining ones are those of Belcredi and Del Maino, which are each 169 feet high. Its oldest church, and perhaps the oldest in Italy, is that of San Michele, which, although the date of its foundation is uncertain, is first mentioned in 661. The cathedral, containing some good paintings, was commenced in 1484, but was never finished. In a beautiful chapel attached to it, are the ashes of St Augustine, in a sarcophagus ornamented with 50 bassi-rilievi, 95 statues, and numerous grotesques. In the Church of San Pietro in Ciel d'Auro are deposited the remains of the unfortunate Boethius. The Certosa of P., the most splendid monastery in the world, lies four miles north of the city. It was founded in 1396, contains many beautiful paintings, and abounds in the richest ornamentation. It has an octagonal cupola, painted ultramarine, and enamelled in gold. It was sacked by the French in 1796. Its church is in the form of a Latin cross, and is 249 feet long, and 173 feet wide. The university of P. is said to have been founded by Charlemagne in 774, and was one of the most famous seats of learning during the middle ages. Its efficiency was much increased by Galeazzo Visconti, who bestowed many privileges upon it in the year 1396. It consists of numerous colleges, and attached to it are a library of 120,000 vols., a numismatic collection, anatomical, natural history, and other museums, a botanic garden, a school of the fine arts, &c. The university is attended by about 1600 students. It has numbered among its professors Alciati, Fidele, Spallanzani, Volta, Scarpa, Foscolo, and Monti.

The other chief edifices comprise private palaces, theatre, gymnasium, &c. P. carries on a good trade in wine, rice, silk, and cheese. Pop. (1862) 30,480.

P., the ancient *Ticinum* (afterwards *Papia*, whence the modern name), was founded by the Ligurii; it was sacked by Brennus and by Hannibal, burned by the Huns, conquered by the Romans, and became a place of considerable importance, at the end of the Roman empire. Then it came into the possession of the Goths and Lombards, and the kings of the latter made it the capital of the kingdom of Italy. It became independent in the 12th c., then, weakened by civil wars, it was conquered by Matthew Visconti in 1345. Since that period, its history is merged in that of the conquerors of Lombardy. Here, in 1525, the French were defeated by the imperialists, and their king taken prisoner; but in 1527, and again in the following year, it was taken and laid waste by the French. It was stormed and pillaged by Napoleon in 1796, and came into the possession of Austria by the peace of 1814. Since 1859, it has been included within the re-organised kingdom of Italy.

PAVIA. See HORSE-CHESTNUT.

PAVILION, a portion of a building, under one roof, of a tent-like form, with the slope of the roof either straight or curved. This form is much used in France—the higher parts of the new buildings at the Louvre are good examples of pavilions. Pavilion roofs are sometimes called French roofs.

PAVLOGRA'D, a town of South Russia, in the government of Ekaterinoslav, and 38 miles east-north-east of the town of that name, on the Voltcha, an affluent of the Dnieper. It was founded in 1780, during the reign of the Empress Catharine II., and its first colonists were the Zaporogsky Cossacks. But in 1782, a great portion of the English garrison of Fort Magon in Minorca, having been subdued by the Spaniards, and being forced by the terms of their capitulation to renounce the English service, obtained liberty from the Empress Catharine to settle in Pavlograd. The garrison was composed chiefly of Corsicans. Pop. of the town (1864), 9309.

PAVO'NIDÆ, a name sometimes used by ornithologists to designate the family of gallinaceous birds more commonly called *Phasianidæ* (q. v.), sometimes applied as a designation to a portion of that family separated from the rest on very slight grounds, the chief distinction being the greater expansion of the tail. See PEACOCK and POLY-ELECTRON.

PAWL, on shipboard, is a catch or hook to prevent the capstan from flying round backwards during a pause in the heaving. A similar catch is used in the common windlass.

PA'WNBROKING (Du. *paand*, Ger. *pfand*, Fr. *pan*, a pledge). The business of lending money on pawns or pledges appears to have been carried on in England by certain Italian merchants or bankers as early at least as the reign of Richard I. By the 12th of Edward I., a message was confirmed to these traders where Lombard Street now exists; the name being, according to Stow, derived from the Longobards who used to congregate there for business purposes. Subsequently, these merchant adventurers became known generally by the name of Lombardens. Their wealth became proverbial. Among the richest of them were the celebrated family of the Medici; from whose armorial bearings it is conjectured that the pawnbroking insignia of the three balls have been derived. The bankers of Lombard Street appear to have exercised a monopoly in pawnbroking until the reign of Elizabeth. The trade is first recognised in law by the act 1st

James I. c. 21. In the perilous days of Charles I. the goldsmiths were very frequently chosen as the custodiers of plate and money; which circumstance seems to have suggested to them the profitable business of lending on pawns and discounting bills. From this time, the oppression and extortion often exercised by brokers has continued to attract much public attention and discussion; and an effort has been made, both in England and on the continent, to obviate the evil by the establishment of what are called Monts de Piété, the object of which is to advance small sums to the very poor at a moderate interest. See MONT DE PIÉTÉ. In England, after many abortive efforts, a Mont de Piété office was started in 1708; but in 1731 it came to a disastrous end. The bubble mania of 1824—1825 gave rise to a similar scheme. In this instance upwards of £400,000 was subscribed; but the undertaking miscarried, and the capital was lost. A similar fate attended the Irish Monts de Piété, of which there were eight in 1841. In 1848, they had all disappeared except one, which lingered to 1853; when it also expired. It would thus seem hopeless to attempt to establish a pawnbroking office in England on any other footing than an ordinary commercial one. The cause of failure will be found to lie, generally, in the great difficulty of conducting a commercial undertaking on charitable principles, with sufficient energy and ability to compete successfully with others originating in the ordinary motives which lead men to engage in trade.

It hardly admits of dispute that the pawn-shop, in its practical working, is an evil—necessary, it may be, but still an evil; and the having recourse to it is strongly to be discouraged. There are, doubtless, cases where men are driven to pawn their goods from causes which are not discreditable, and which do not render it certain that they are on the road to ruin; but such cases are rare exceptions to the general rule. Besides making borrowing too easy, and thus encouraging the fatal habit of anticipating income, the pawn shop is, in nine cases out of ten, the door to the drinking-shop. Even where the one does not directly lead to the other, it generally does so in the end. That 'borrowing dulls the edge of husbandry' applies with a force increasing in a geometrical ratio as we descend in the scale of society. Admitting, however, that with all its tendency to demoralise, pawnbroking is, in many cases, of value in tiding over unforeseen pecuniary difficulties, it is sufficient to say, that so long as improvidence prevails among large classes of society, and so long as even the most prudent are liable to unforeseen accidents, the accommodation of the pawn-shop is to a certain extent a necessity, and like other demands of the public will continue to be supplied. Nor are those who supply this demand to blame, any more than the caterers for many other expenses which economists pronounce to be wasteful. The fault, where there is a fault, is in those who borrow, not in those who lend. The legislature, accordingly, instead of trying to put down pawnbroking, has wisely confined itself to putting it under stringent regulations so as to prevent as far as possible its abuse.

Pawnbrokers are restricted in their business by various acts of parliament, some of which were passed before the recent abolition of the Usury Acts. The chief statute is the 39 and 40 Geo. III. c. 99, which requires them to take out a licence (for which they pay £7, 10s., and if they deal in silver-plate, £5, 15s. additional), fixes the rate of interest, and makes it necessary that a table of interest should be put up in a conspicuous part of the shop, to keep books with correct entries of the name and place of abode of the owners

of goods, &c. If the owner of goods has just come to market, and such goods have been pawned at a previous sale, the justice of the peace may grant a search warrant, and if found, the goods must be returned to the owner. Pawnbrokers are extremely particular in taking in pledge goods of immovables to an unblemished state, and also any goods whose circumstances which ought to have aroused their suspicions. Goods which have been in pledge for a year may be sold, unless notice not to sell be given before the expiration of the 12 months, in which case three months more are allowed to the owner to redeem them. If the duplicate is lost, the owner of the goods may obtain a fresh one on certifying the fact of his being the owner before a justice of the peace. If the money borrowed be forfeited with interest within the year, the pawnbroker is bound to deliver them up, otherwise a justice of the peace may be ordered to compel him to do so. The mode of selling forfeited goods is prescribed by the statute to be by auction, and at four times in the year—the auctioneers to mention the names of the pawnbrokers, and the month when the goods were pawned, and the number entered in the pawnbroker's books. The result of the sale is to be entered in the books of the pawnbroker and auctioneer, and the surplus is to be paid on request to the owner of the goods after deducting the costs of the sale. Pawnbrokers are not to take goods in pawn from persons under the influence of drink, or under the age of 16, nor after sunset hours, according to the season of the year. In case of penalties imposed on pawnbrokers for offences against the act, these, in several cases, a portion of them, are made payable for the benefit of the poor of the parish. A pawnbroker is not liable for the return of the goods for their value in case of an accidental fire occurring on the premises, but in all cases of loss, or destruction by his neglect or fault, the pawnbroker is liable.

The greatest pawnbroking establishment in the world is the *Maison de Paise* of Paris. It trades with borrowed capital, and with the profits of former years, temporarily capitalised. Recent statistics are not at hand; but in 1851 it received 2,481,776 pledges, valued at £1,026,571, including jewels, and the average charge was about 15 per cent. per annum. Taking one of the largest offices in England out of London, we find that in 1857 it received 142,935 pledges, valued at £28,569, including jewellery, and the average charge was 24 per cent. per annum. Various circumstances render the difference between the rates really much less than these figures indicate; still there is no doubt that the interest charged on small loans is less at the *Maison de Paise* of Paris than in the pawnbroking offices in this country; but the convenience is limited by the fact of the French establishment taking no loans under three francs.

What is called in England the 'dolly shop' and is called the 'new pawn' system is carried on in London ostensibly buying and selling. They receive articles as bought; there being a distinct understanding that the seller is to have an opportunity of repurchasing within a limited time, at an unaltered increase of price. The general understanding as to charge is a penny per shilling per week; a month being usually allowed to redeem the article. The 'new broker' is commonly assumed to be a man whose article is one which the dealer would not take, or will not give as high an advance upon.

PAWTUCKET, a town of Rhode Island, U.S., on both sides of the Pawtucket River, 4 miles north of Providence. A fall of 50 feet in the river, and the proximity to the sea, caused it to be selected by Samuel Slater, in 1790, as the site of the first cotton

factory in the United States. It now contains 11 cotton mills, 8 machine shops, 3 furriers, and many factories of iron engines, building, jewellery, &c. There are 11 churches, 4 banks, 2 newspapers, a public library, with extensive steamboat and railway connections. Pop. in 1860, 8850.

PAX, called also *Paxificator* and *Conservator* (Lat. *paxator*, I kiss; the 'Kiss of Peace') and also a sacred utensil, employed in some of the solemn services of the Catholic Church in the ceremony of giving the so-called 'kiss of peace' during the mass. The practice of saluting each other—the men, men and the women, women—during public worship, and particularly in the *missa*, or *love-feast*, is frequently alluded to by ancient writers as Cyril of Jerusalem, Cassich xv., and St. Augustine, *Serm.* 327. All the ancient liturgies, without exception, refer to it as among the rites with which the Eucharist was celebrated; but they differ as to the time and the place in the Eucharistic service in which it is introduced. In the Eastern liturgies it is known to the Western after the Offertory (q. v.), and in the Roman it immediately precedes the communion. The ceremony commences with the celebrating bishop or priest, who salutes upon the cheek the deacon, and by him the whole is rendered to the other members, and to the first deacon of the assistant clergy. Originally the holy also were included, but this has long since been abandoned. It is when the cross is celebrated by a high dignitary that the *stemon* called the *pax* is used. The *pax* is sometimes a cord, sometimes a reliquary, sometimes a tablet with a figure sculptured or enameled upon it. Having been kissed by the celebrant, and by him handed to the deacon, it is carried by the latter to the rest of the clergy. In ordinary cases, the *pax* is given by merely leaving, and approaching the clerk to the person to whom it is communicated. The *pax* is omitted in the mass of Maundy-Thurs day (q. v.), to express horror of the treacherous kiss of Judas.

PAXO, one of the Ionian Islands, lies 10 miles south-west of the coast of Albania, and 9 miles north-south-east of the island of Corfu. It is about 5 miles long, and about 2 miles broad. The capital, or rather the chief village, is Port Gale (pop. 2000), on the east coast. Olives, almonds, and vines are grown, and the island is famous for its oil. Water is sometimes very scarce. Pop. of the island about 5000.

PAXTON, Sir Joseph, English architect and architecturalist, was born at Milborne-Dryant, near Wiltshire, Wiltshire, in 1803. He was sent to Wiltshire Free School, but left it at an early age, and obtained employment as a working gardener. He entered the service of the sixth Duke of Devonshire at Chiswick, and was thence transferred to Chatsworth, where he became the duke's chief gardener. His abilities as a horticulturalist found ample scope in the beautiful gardens of Chatsworth, and are further attested by *Paxton's Magazine of Botany*, of which he was editor, as well as other works on plants and flowers. The experience he obtained in designing extensive glass conservatories at Chatsworth led him to propose a Crystal Palace of glass and iron for the Great Exhibition (q. v.) of 1851. It was the first time these materials had been employed on so extensive a scale, and visitors found an inexhaustible theme of admiration in a fairy palace so novel, beautiful, and magnificent. His design obtained for him great popularity and the honour of knighthood. The Crystal Palace of 1851 was removed from Hyde Park, but became the germ of the nobler and more

splendid Palace at Sydenham, the construction of which he superintended, the grounds were also laid out by him. Crystal palaces for exhibitions of artistic and industrial objects have since 1851 been constructed at Dublin, New York, Paris, Manchester, &c. In 1854, P. was returned to parliament on the liberal interest for Coventry, which he still (1864) continues to represent. He is a member of many learned societies in Europe, and his works on horticulture and botany are much esteemed.

PAYMASTER-GENERAL is an officer of the British ministry, but not of the cabinet, charged with superintending the issue of all moneys voted by parliament. He is virtually the paymaster of the public service, having no control over the sums issued, and paying merely on the order of the department concerned. The salary of the office is £2000 per annum. The paymaster-general is always either a peer or a member of the House of Commons, and of course changes with the ministry. Of late years the office has been held in conjunction with that of Vice-president of the Board of Trade. The paymaster-general is assisted by a deputy and a staff of clerks, the annual cost of the whole department amounting to £21,500. The first notice of this office is in the early part of the reign of Charles II., when the paymaster-general was nothing more than the sole paymaster of the army. The present extensive duties of the office have been added by degrees during the 19th century.

PAYMASTER, MILITARY AND NAVAL.—Military paymasters are either 'District' or 'Regimental'. Of the latter, who constitute by far the more numerous class, there is one to every brigade of artillery, regiment of cavalry, and battalion of infantry. The paymaster holds no other commission, but the appointment is nearly always conferred upon some person who has previously held a combatant rank in the army. The functions of paymaster comprise issuing and accounting for the pay of officers and men, and having charge generally of all the finances of the corps. In discipline, the paymaster is responsible to the officer commanding the regiment; but in all money matters he looks for orders to the War Office alone. He commences with a pay of 12s. 6d. a day, with the relative rank of captain; and after twenty years' service attains the pay of £1, 2s. 6d. a day and relative rank as major. Regimental paymasters were first appointed during the French war.

District paymasters have financial charge in recruiting districts. They are usually old officers, and receive each 2s. 6d. a day more than the rates of regimental pay. Both in districts and regiments army paymasters have to provide security for the faithful discharge of their duty.—The **NAVAL PAYMASTER** is for a ship what the military paymaster is for a regiment; but he adds to those duties some of those performed in the army by the quartermaster, commissariat, and military storekeeper, for he has charge of the provisions, clothing, and miscellaneous stores, as well as of mere money. Paymasters are commissioned officers, receiving from £1, 12s. 11d. to 13s. 8d. a day, and ranking, according to service, with captains, commanders, and lieutenants. Up to the year 1844 paymasters were styled pursers, and were paid by profits they made on certain of the ship's charges. At a still earlier period these pursers had been warrant-officers.

PAYMASTER-SERGEANT, in the army, is a non-commissioned officer, whose duty it is to act as clerk to the paymaster. He ranks with other staff-sergeants, and receives from 2s. to 3s. a day, according to his corps, with an increase of 6d. after

seven years' uninterrupted service as paymaster-sergeant.

PAYNISING, a process for preserving and hardening wood, invented by a Mr Payne. It consists in placing well-seasoned timber in an air-tight chamber, and then, when, by means of a powerful air-pump, the wood is deprived of its air, a solution of *sulphuret of calcium*, or of sulphuret of barium is admitted, and readily fills up the empty vessels all through the wood. The air-pump is again used, and the superfluous moisture is drawn out, and a solution of sulphate of iron is injected; this acts chemically upon the sulphuret of barium or of calcium, and forms all through the wood either the insoluble sulphate of barium (heavy spar) or of lime (gypsum). The addition of these mineral materials renders the wood very heavy, but it becomes also very durable, and almost incombustible.

PEA (*Pisum*), a genus of plants of the natural order *Leguminosae*, suborder *Papilionaceae*, closely allied to the genus *Lathyrus* (q. v.), from which it differs chiefly in the triangular style. Two species, supposed to be natives of the south of Europe and of the East, are very extensively cultivated for their seeds (peas), which are the best of all kinds of pulse; the **COMMON PEA** or **GARDEN PEA** (*P. sativum*) in gardens, and the **FIELD PEA** (*P. arvense*) in fields; both of them climbing annuals, with pinnate leaves, ovate leaflets, and branching tendrils in place of a terminal leaflet; the Garden Pea distinguished by having two or several flowers on each flower-stalk, the flowers either red or white, more generally white, and the seeds subglobular; the Field Pea having one flower on each flower-stalk, the flowers always red, and the seeds angular from crowding and compression in the pod. But it is not improbable that they are truly one species, of which the Garden Pea has, through cultivation, departed furthest from the original type. Peas have been cultivated in the East from time immemorial, although the ancient Greeks and Romans do not seem to have been acquainted with this kind of pulse, the cultivation of which was apparently introduced into Europe very early in the middle ages; and its cultivation extends from warm climates, as India, even to the Arctic regions, the plant being of rapid growth and short life. The seeds of the Garden Pea are used for culinary purposes both in a green and in a ripe state; also the green succulent pods of some varieties, known as Sugar Peas or Wyker Peas, in which the membrane lining the inside of the pod—parchment-like in most kinds—is much attenuated. Field peas are used both for feeding cattle and for human food. For the latter purpose, peas are often prepared by being *shelled*, or deprived of the membrane which covers them, in a particular kind of mill; they are then sold as *Split Peas*, and are much in use for making *Pea Soup*. They are also ground into meal, which is used in various ways, chiefly for making a kind of pottage and of unleavened bread. In the countries bordering on the Mediterranean, peas are roasted in order to eating.

There are innumerable varieties both of the Field Pea and the Garden Pea, those of the latter being so much the products of horticultural art, that they cannot be preserved without the utmost attention. Some of the kinds of garden peas have long stems, and require for their support stakes of six or eight feet in height; others are of humbler growth; and certain dwarf kinds, preferred as most convenient in many gardens, succeed very well without stakes. The largest kinds are sown in rows about four feet asunder. In Britain, garden peas are sown at different times from February to June, in order to

secure a supply of green manure during a considerable part of summer and autumn; and in the northern part of the island there are also sown in the end of autumn a very little production being sufficient for use during the winter. Certain small kinds, on very rapid growth, known as *Early Peas*, are sown for the first sowings, although less productive than many others. The varieties known as *Wintered Peas* are remarkable for their size and tenderness in a green state, but shriveled as they ripen.

Seeds of peas are generally used for potting, when they can be obtained, and nothing can be better; but in lack of them, strings are sometimes stretched between poles along the rows. These peas are sometimes sown alone, and allowed to support each other, where the soil is not very rich, but are very generally sown with beans, to which they cling.

Chalk and other calcareous soils are particularly suitable for peas, and in other soils a good hold may be obtained unless the land has been well tilled, or manured with gypsum. The true use of lime is supposed, however, to be indispensable in the quality of garden peas intended to be used green.

Peas are cultivated to a considerable extent as a winter crop in Britain, but are best adapted to those districts in which the climate is least moist, the seeds being very apt to grow in the pods when most weather prevails in autumn, by which the crop is injured or destroyed. The most productive kinds being also in general the most bulky in seed, are very apt to lodge before the pods are ripe, in wet seasons, and particularly in rich land. On deep or fertile, rather a precarious crop.

The land or sowing of peas is most for feeding cattle, and for the sake, field peas are often reaped before they are quite ripe, great care being taken in making the straw to provide for ventilation, so that it may not heat. Few kinds are more nutritious and more nutritious than hay.

Land to be sown with field peas should be very deep, and in particular free of clough grass; otherwise the best management cannot prevent its becoming more food while covering the pea crop. The soil ought always to be sown in rows, twelve inches apart, or in rich soils, eighteen or twenty inches apart. Various means are employed for sowing peas; they are not infrequently ploughed down with second furrow; but the seed ought not to be sown more than four inches under the surface, and indeed that depth is too great; almost every farmer sees their peas deeper than the atmosphere would, to place them beyond the reach of wind damage. All possible means ought to be used to keep the land free of weeds. In some districts peas are generally sown broadcast, which makes it impossible to do anything for this purpose. In the harvesting of peas, the sheaves are generally left to rot till the land is somewhat dry. In doing it shrike very much. Broadcast peas are sown with the scythes, and the harvesting of them is managed much as that of hay.—*Wintered Peas*, a variety with very small seeds, are well cultivated in France and Germany, being sown in October, enduring the severest frosts without injury, and ripening very early.

Peas being one of our most important agricultural and horticultural crops, peas are largely raised in Britain, the quantity sometimes reaching 1,000,000 quarters. We receive them from France, Spain, the Swiss Towns, Holland, America, Canada, China, South North America; but of these, imported and our North American sources and the greater part. As an article of

food, if not taken too often or without other food, peas are very valuable, as they contain a large percentage of mucus, which is a flesh-forming principle. This principle in the pea has been called *legumine*, but chemists are now generally agreed that it is identical with the mucus of cheese. The following is an analysis of one hundred parts of pea meal:

Water,	114
Protein,	20.1
Starch,	67.9
Sugar,	0.0
Fat,	0.0
Fiber,	0.0
Mineral Matter,	2.5

1000

The crisp peas of the garden varieties are amongst our most esteemed vegetables, and the meal of the white or yellow varieties used in soup is a highly nutritious and agreeable food.

A plant found in some parts of the shores of Britain, as well as of continental Europe and North America, and known as the *Pea*, has been commonly referred to the genus *Pisum*, and called *P. sativum*, although botanists now generally refer it to *Lathyrus*. It much resembles the common pea; has large reddish or purple flowers on many-flowered stalks; and its seeds have a disagreeable bitter taste. Its abundance in the soil most at Oxford, in Somerset, is said to have saved twenty persons from death by famine in 1655.—The other species of *Pisum* are few. But the name *Pea* is often given to species of other papilionaceous genera. The *Swedish Pea* and *Everlasting Pea* are species of *Lathyrus*. The *Cruck Pea* (p. v.) is a species of *Cicer*.

PEA BEETLE, or PEA CHAPER (*Bruchus pisi*), a coleopterous insect, very destructive to crops of peas in the north of Europe and in North America. It is about a quarter of an inch long, black, variegated with bright brown hairs, and with white spots and dots on the wings.

Pea Beetle (*Bruchus pisi*).
a. Natural size.

It lays its eggs in the young pods, one for each pea, and the larva eats its way into the pea, and completely hollows it out.

PEABODY, GEORGE, an American merchant, whose name deserves to be held in remembrance on account of his magnificent philanthropy, was born at Danvers, Massachusetts, February 18, 1795. His parents were poor, and his only education was received at the district school. At the age of 11 he was placed with a grocer, and at 15 in a haberdasherie shop in Newburyport. When 22 years old, he was a partner with Kisha Riggs in Baltimore. Coming to England in 1827 to buy merchandise, he transacted financial business for the state of Maryland. In 1827 he removed to London, and in 1842 became a banker, and accumulated a large fortune. He did not forget his humble origin or place of birth. In 1856, on the 50th anniversary of the settlement of his native town, he sent him 20,000 dollars to found an Educational Institute and Library, a sum he afterwards increased to 50,000 dollars, with 10,000 to North Danvers. He also contributed 10,000 to the first Grinnell Arctic Expedition, 500,000 dollars to the city of Baltimore for an Institute of Science, Literature, and the Fine Arts, and in 1861, on retiring from active business in London, he made the splendid donation of 250,000 sterling, for the benefit of the poor of

London, which is now being expended in building improved dwellings for the working-classes.

PEACE, ARTICLES OF THE, in English Law, are certain complaints made against a person who threatens another with bodily injury, and the redress given is to bind the threatening party over with sureties to keep the peace. All justices of the peace have, by their commission, authority to cause persons to find sufficient security to keep the peace, and an ancient statute also gives authority. Hence any one who is threatened either in person or property, or in the person of his wife or child, may go before a justice of the peace and complain on his oath of the fact. The justice is to consider if the language used amounted to a threat, and if he is satisfied that it does, he issues his warrant to bring the party before him, who is then heard in explanation, and if it is not satisfactory, he is ordered to find sureties. If he cannot do so, he is committed to prison for a limited time, or until the next quarter-sessions. The party, when he finds sureties, is bound over for a term not exceeding twelve months. If he has entered into recognizances (i. e., given a bond with sureties), and he break the peace, he forfeits his recognizance, and the sureties' goods can be seized to pay the amount of the bond.

PEACE, OFFENCES AGAINST THE PUBLIC, are those offences which consist in either actually breaking the peace, or constructively doing so by leading directly to a breach. These offences are now usually known under the heads of unlawful assemblies, seditious libels and slanders, riots, affrays, challenges to fight, forcible entry and detainer, and libel and slander. Those who take part in an unlawful assembly commit a misdemeanour against the public safety. All persons assembled to sow sedition, and bring into contempt the constitution, are in an unlawful assembly. Thus it was held that an attempt to hold a national convention was illegal, for it was impossible to anticipate with certainty the peaceable result of such a meeting. It is, however, somewhat difficult to define precisely what amounts to an illegal assembly, except by saying that it points to some course inconsistent with the orderly administration of the laws. It is the duty of all individual citizens to resist and oppose any unlawful assembly; but the duty rests primarily with the magistrates of the district, who are indictable for breach of duty in not taking active and immediate steps to put down riots. Thus the mayor of Bristol was indicted for not suppressing the riots at the time of the Reform Bill. The magistrates ought to call at once upon special constables to be sworn in, and if these are insufficient, to call for the aid of the military. Seditious libels are also offences against the peace, as inciting directly to a breach. Such are libels vilifying the Sovereign or the Houses of Parliament, or the courts of justice, or even a foreign sovereign, as in the case of Peltier, who was tried for a libel against the Emperor Napoleon I., the tendency of such a libel being to breed misunderstanding between our own sovereign and the foreign sovereign. A riot is the most active form of an offence against the public peace. To constitute a riot, there must be at least three persons engaged together in pursuance of an illegal purpose. Riots often originate in an attempt to redress summarily some private wrong. On such an occasion, before extreme measures are resorted to, and as a test of the good faith of those who are spectators, instead of parties, and by way of full notice to all concerned, the justices of the peace may read the Riot Act, 1 Geo. I. st. 2, c. 5, which commands all persons to disperse within one hour after a proclamation is read, otherwise they will be

guilty of felony. Persons not removing within one hour thereafter may be arrested, and carried before a justice, and committed to prison. It is, however, possible that the justices may make a mistake in thinking that to be an illegal assembly which is not so, for the mere reading of the Riot Act does not alter the character of the assembly, and accordingly if the party arrested prove at the trial that it was no illegal assembly he will be discharged. An affray is also an offence against the public peace, being a public assault, i. e., an assault committed in presence of third parties, for this is apt to lead to further breaches of the peace by others joining in it. Thus prize-fights and duels are affrays, and all present at them are principal offenders, and may be arrested by a constable and bound over to keep the peace, and punished by fine and imprisonment besides. So challenges to fight, provocations to fight, and forcibly entering into a house, are misdemeanours against the public peace.

PEACH (*Amgdalus Persica*), a tree much cultivated in temperate climates for its fruit; a native of Persia and the north of India; of the same genus with the ALMOND (q. v.), and distinguished by oblongo-lanceolate serrulate leaves; solitary flowers, of a delicate pink colour, appearing before the leaves; and the sarcocarp of the drupe succulent and tender, not fibrous as in the almond. This difference in the drupe has been made by some the ground of a generic distinction, but there are intermediate states, so that others have doubted if the P. and almond are even specifically distinct. The NECTARINE differs from the P. only in having a smooth fruit, whilst that of the P. is downy or velvety, and is a mere variety, probably produced and certainly preserved by cultivation. Both peaches and nectarines are divided into *freestones* and *clingstones*. In the former the flesh of the fruit parts from the stone; in the latter it adheres to it. The Freestone P. is the *Pêche* of the French, the Clingstone P. their *Pavie*; the Freestone Nectarine they call *Pêche lisse*, and the Clingstone Nectarine *Bruignon*. Of all these there are many sub-varieties, the finer ones being perpetuated by budding, which in Britain is generally on plum or almond stocks. There is a remarkable variety of Chinese origin, with the fruit compressed and flattened, and with almost evergreen leaves. The P. is much cultivated in the south of Europe, in many parts of the East, in the warmer temperate parts of North and South America, in Australia, &c., as a standard tree; in general, it is rather a small tree with a full head; in Britain, it is generally trained on walls, and in the northern parts of it on flued walls or in hot-houses, although even in Scotland excellent peaches are ripened on open walls without artificial heat. The Nectarine is rather more tender than the peach. In the extensive P. orchards of New Jersey, Pennsylvania, Maryland, and other states of North America, which sometimes contain 10,000 or 20,000 trees, the fruit is often of very inferior quality, from want of care in cultivation—the orchards being planted by simply depositing the seed in the ground; and much of the fruit is used for making a spirituous liquor called *Peach Brandy*; much of it is dried in ovens, or in drying-houses furnished with stoves, or, in the more southern states, in the sun, each fruit being divided into two parts, and the stone taken out, and when dried it is sent to market to be used for pies; the refuse of the orchards is used for feeding swine.—The P. is a very pleasant and refreshing fruit, and in a stewed form is useful in slight cases of constipation. The leaves, when fresh, have the smell and taste of bitter almonds; and by bruising them, mixing the pulp with water, and distilling, the *Peach Water* is

showed which is so much esteemed by many for its coloring articles of dress. They have been considered as a relative and as a vegetable. The seeds almost entirely serve in their properties with those almonds; the flowers exhibit an odour of blue almonds; and both seeds and flowers are employed in the manufacture of a liquor called *Peach*.

PEACH-WOOD, or **LIMA-WOOD**, a tree-wood derived from South America, supposed to be the product of a species of *Cassipouia*, allied to that which yields the Nicaragua wood. It yields a fine red colour, whence the name, and is now much used in painting and dyeing.

PEACOCK, or **PEAFOWL** (*Pavo*), a genus of gallinaceous birds of the family *Peucedani*, or *Peucedani*, of which only two species are known, natives of the East Indies; birds of large size, and remarkable for the magnificence of plumage. The bill is of moderate size, somewhat hooked towards the tip, the cheeks nearly naked; the head crested; the head rather long, and armed with a single spine; the wings short; the upper tail-coverts prolonged as beyond the tail, and forming a splendid train—usually called the *tail*—which is capable of being raised and spread out into a great disk, the lower tail being at the same time elevated to support it. The Common P. (*P. cristatus*) has for crest a kind of

band the male bird, has no train, and is of dull plumage, mostly brownish, except that the neck is green. As in some other gallinaceous birds, the female has been known, in old age, to assume the plumage of the male. Individuals with white plumage not infrequently occur, in which even the eye-like spots of the tail are but feebly indicated; and pied peacocks, having the deep blue of the neck and breast contrasted with pure white, are sometimes to be seen. The P. is generally supposed to have been known to the Hebrews in the time of Solomon, but it is not certain that the word commonly translated *patience* in the account of Solomon's negotiations with Tyre (1st Chron. ii. 21) does not signify *peacock*. It is commonly stated that it first became known to the Greeks in the conquest of Alexander's expedition to India, but Aristophanes mentions it in plays written before Alexander was born. The P. became common among the Greeks and Romans; a sumptuous banquet in the latter days of Roman greatness was scarcely complete without it; and wealth and folly went to the excess of providing dishes of peacocks' tongues and peacocks' brains. Throughout the middle ages, also, a P. was often presented at the tables of the great, on great occasions, the skin with the plumage being placed around the feet after it was cooked. The P. is now common in most parts of the world; generally kept, however, except in warm countries, for ornament rather than for profit, although both the flesh and the eggs are very good. It readily partakes of all the ordinary food provided for the poultry-yard, and is fond of herbs and succulent vegetables. It is hardly enough even in cold climates, except that few eggs are laid, and the young are difficult to rear, but the adult birds set no treasure in the tops of houses, stables, &c., during the hottest frosty nights, never, if they have avoid it, submitting to the confinement of a roosting place, like that of the common fowl. Peacocks are found in almost all parts of India, China, &c., and the multitudes in which they occur in some districts are wonderful. 'About the palace in the Janghery district,' Colonel Williamson says, in his *Oriental Field Sports*, 'whole woods were covered with their beautiful plumage, to which a rising sun imparted additional brilliancy. The small patches of plain, among the high grass, most of them cultivated and with mustard then in bloom, which induced the birds to feed, increased the beauty of the scene; and I speak without hyperbole when I assert that there could not be less than 1200 or 1500 peacocks, of various sizes, within sight of the spot where I stood for near an hour.' Sir James Emerson Tennent, also, in his work on Ceylon, says that 'in some of the unfrequented portions of the eastern province, to which Europeans rarely resort, and where the peacock are unmolested by the natives, their number is so extraordinary that, regarded as game, it seems to be "sport" to destroy them; and their cries at early morning are so tumultuous and incessant as to banish sleep, and amount to an actual inconvenience.'—The harsh cry of the P. seems to have been imitated in its Greek name *Pei*, and probably has given rise also to the Latin *Pavo* and the English *peacock*. The P. is a wild state, always roosts on trees, but makes its nest on the ground. When alarmed, as it feeds on the ground, it cannot readily take wing, and is sometimes run down by dogs or by hawken. The other species of P. is the Javan P. or JAVAN P. (*P. javanensis*, *Javanica*, or *orientalis*), a native of some of the south-eastern parts of Asia and neighbouring islands. It is nearly equal in size to the Common P., but of less brilliant although very similar plumage. The cheeks and around the

Peacock.

spots of 2d upright feathers, with slender almost erect shafts and broad tips. The tail consists of 12 brown stiff feathers, and is about six inches long. The train derives much of its beauty from the loose softness of the feathers, whilst their great number and the unequal length contribute to its gorgeousness, the upper feathers being successively shorter, so that when it is erected into a disk, the eyelike or ocellate spot at the tip of each feather is displayed. The lowest and longest feathers of the train do not terminate in such spots, but in spread, as feathers which surround the erected disk. The tip of the neck, the green and black of the back and wings, the beak, green, violet, and gold of the tail, the arrangement of the colours, their softness and play of colour in changing, by which render the male P. an object of universal admiration, a sentiment in which the bird himself evidently participates in a degree that is very curious, as he struts about to display himself in show, and labours to attract attention, affording a familiar proverbial image of ostentation and pride. When the disk is erected, the P. has the grace of pointing the shafts of the feathers against each other in a very peculiar manner, by a strong peculiar movement. The female is much smaller

than the male bird, has no train, and is of dull plumage, mostly brownish, except that the neck is green. As in some other gallinaceous birds, the female has been known, in old age, to assume the plumage of the male. Individuals with white plumage not infrequently occur, in which even the eye-like spots of the tail are but feebly indicated; and pied peacocks, having the deep blue of the neck and breast contrasted with pure white, are sometimes to be seen. The P. is generally supposed to have been known to the Hebrews in the time of Solomon, but it is not certain that the word commonly translated *patience* in the account of Solomon's negotiations with Tyre (1st Chron. ii. 21) does not signify *peacock*. It is commonly stated that it first became known to the Greeks in the conquest of Alexander's expedition to India, but Aristophanes mentions it in plays written before Alexander was born. The P. became common among the Greeks and Romans; a sumptuous banquet in the latter days of Roman greatness was scarcely complete without it; and wealth and folly went to the excess of providing dishes of peacocks' tongues and peacocks' brains. Throughout the middle ages, also, a P. was often presented at the tables of the great, on great occasions, the skin with the plumage being placed around the feet after it was cooked. The P. is now common in most parts of the world; generally kept, however, except in warm countries, for ornament rather than for profit, although both the flesh and the eggs are very good. It readily partakes of all the ordinary food provided for the poultry-yard, and is fond of herbs and succulent vegetables. It is hardly enough even in cold climates, except that few eggs are laid, and the young are difficult to rear, but the adult birds set no treasure in the tops of houses, stables, &c., during the hottest frosty nights, never, if they have avoid it, submitting to the confinement of a roosting place, like that of the common fowl. Peacocks are found in almost all parts of India, China, &c., and the multitudes in which they occur in some districts are wonderful. 'About the palace in the Janghery district,' Colonel Williamson says, in his *Oriental Field Sports*, 'whole woods were covered with their beautiful plumage, to which a rising sun imparted additional brilliancy. The small patches of plain, among the high grass, most of them cultivated and with mustard then in bloom, which induced the birds to feed, increased the beauty of the scene; and I speak without hyperbole when I assert that there could not be less than 1200 or 1500 peacocks, of various sizes, within sight of the spot where I stood for near an hour.' Sir James Emerson Tennent, also, in his work on Ceylon, says that 'in some of the unfrequented portions of the eastern province, to which Europeans rarely resort, and where the peacock are unmolested by the natives, their number is so extraordinary that, regarded as game, it seems to be "sport" to destroy them; and their cries at early morning are so tumultuous and incessant as to banish sleep, and amount to an actual inconvenience.'—The harsh cry of the P. seems to have been imitated in its Greek name *Pei*, and probably has given rise also to the Latin *Pavo* and the English *peacock*. The P. is a wild state, always roosts on trees, but makes its nest on the ground. When alarmed, as it feeds on the ground, it cannot readily take wing, and is sometimes run down by dogs or by hawken. The other species of P. is the Javan P. or JAVAN P. (*P. javanensis*, *Javanica*, or *orientalis*), a native of some of the south-eastern parts of Asia and neighbouring islands. It is nearly equal in size to the Common P., but of less brilliant although very similar plumage. The cheeks and around the

eyes are yellow; the neck, and other fore parts, greenish with golden reflections. The crest is longer than that of the Common P., its feathers less equal, and webbed along their whole length.

PEACOCK-STONE, the name under which the dry cartilaginous ligaments of some large lamellibranchiate molluscs, as the pearl oyster, are sold by jewellers. They are used for ornamental purposes, although not so much as formerly; and far more on the continent of Europe, particularly in Portugal, than in Britain. They have opaline reflections, and are therefore sometimes called *Black Opal*.

PEA CRAB (*Pinnotheres*), a genus of brachyurous crustaceans, with nearly circular and not very hard carapace. They are of small size, and interesting from their living within the mantle-lobes of lamellibranchiate molluscs, a circumstance which was well known to the ancients, and gave rise to many curious fables. A species (*P. veterum*) is very common in the *pinna* of the Mediterranean, and was imagined to render important services to its host in return for its lodging, keeping a lookout for approaching dangers, against which the blind *pinna* itself could not guard, and particularly apprising it, that it might close its shell when the cuttle-fish came near. It is curious to find this repeated by Hasselquist, in the middle of last century, as a piece of genuine natural history. Whether the P. C. lives at the expense of the mollusc, and sucks its juices, is uncertain. It is certain that the flesh of such molluscs is palatable to pea crabs, and they eat it greedily in the aquarium. The friendship of the P. C. and the *pinna* is of course as fabulous as that of the lion and jackal, or of the rattlesnake, the owl, and the prairie-dog. A species of P. C. (*P. pisum*) is very common within the mantle-lobes of the Common Mussel on the British coasts. Species are found in almost all parts of the world.

PEA MAGGOT, the caterpillar of a small moth (*Tortrix* or *Grapholitha pisi*), which lays its eggs in young pods of peas. The caterpillar lives in the pods, and eats the peas. This moth is very common in Britain, and in wet seasons the pods of peas are often found very full of its caterpillar.

PEAN (Old Fr., *pannes*, furs), one of the furs borne in Heraldry, differing from Ermine only in the tinctures: the ground being sable, and the spots of gold.

Pean.

PEA ORE, a form of compact brown iron ore (hydrated peroxide of iron), consisting of round smooth grains, from the size of mustard-seed to that of small pease. Sometimes the grains are still smaller and flattish. This iron ore is very abundant in some places in France, and is smelted.

PEAR (*Pyrus communis*), a tree of the same genus with the Apple (see *PYRUS*), and like it one of the most extensively cultivated and valuable fruit-trees of temperate climates. The leaves are ovate, serrated, smooth on both surfaces, and without glands; the flowers are produced in corymbs, which may almost be called umbels, and are smaller than those of the apple; the styles are distinct and not combined at the base, as in the apple; and the fruit is hemispherical at one end, tapering gradually away, more or less rapidly, to a point at the other. The pear-tree grows wild in woods and copses in Britain, on the continent of Europe, and throughout the temperate parts of Asia. In its

wild state it is usually either a large shrub or a small tree, thorny, and with small austere fruit. In cultivation it is without thorns, becomes a tree of 40 or 50 feet high, sometimes more; and its stem attains a diameter of three feet. Cultivation has wrought even greater changes in the size and quality of its fruit. The pear has been cultivated from remote antiquity. Its cultivation was probably introduced into Britain by the Romans. The cultivated varieties are extremely numerous; and many new ones of great excellence have recently been produced. The *Jargonelle Pear* may be mentioned as one of the most esteemed of the varieties long known in Britain. Some of the kinds called *Bergamot* and *Beurré* are highly esteemed. Many new kinds have recently been introduced into Britain from France and Belgium. The varieties of pear differ much in hardiness and in fitness for particular soils; although a deep, moderately strong, dry, loamy soil is the best for this fruit. The best varieties are cultivated in Britain as wall-trees. Pears succeed well as espaliers. They are generally grafted on seedling stocks of the wild pear, but sometimes on the rowan, and sometimes on the quince. Pears grafted on quince stocks are the best for shallow soils. The flowers and fruit of the pear are mostly produced on spurs, which spring from branches of more than one year old. Various modes of training and pruning are practised for pear-trees. Among the varieties of pears are some which ripen early in autumn, and some which do not ripen till the beginning of winter, and which even require to be mellowed by keeping for a short time; whilst some of the kinds cannot easily be kept for more than a few days. In general pears cannot be kept so long nor so easily as apples. Pears are sometimes made into a preserve with syrup; and sometimes cut into pieces, and dried in the sun or in an oven, to be afterwards used in pie, a practice very prevalent in France.—A very agreeable fermented liquor called *Perry* is made from pears, in the same manner as Cider from apples; and pear orchards for this purpose are to be seen in some parts of England, especially in Wiltshire and Herefordshire. The varieties of pear cultivated for making perry are all rather austere, and those which yield the best perry are far too austere to be palatable.—The wood of the pear-tree is reddish, very hard, fine-grained, and valuable to turners and joiners. It is often dyed black in imitation of ebony, which it then greatly resembles.

Besides the varieties of pear usually referred to *Pyrus communis*, some are occasionally cultivated which are generally regarded as distinct species. Such are the **AURELIAN PEAR** (*P. salicifolia*), a native of France, with leaves much narrower than the common pear, and a long fruit, which is used for making perry; the **SNOWY PEAR** (*P. nivalis*), a native of the Alps of Austria, with oval ovate leaves, white and silky beneath, and a globose fruit, which is very acid till it becomes quite ripe, or is beginning to decay, when it is very sweet; the **SAND PEAR** (*P. Sinensis*), a native of China and Cochinchina, with heart-shaped, shining, almost evergreen leaves, and apple-shaped warted fruit, very gritty, and fit only for baking, cultivated in gardens in India, but hardly in Britain. The *Pashia* (*P. pashia* or *P. variolosa*) is a native of the Himalaya; the fruit of which is only edible when blighted or partially decayed. The **PALNOO** (*P. lanata*) is another Himalayan species with edible fruit. Both are quite hardy in Britain.

PEAR, PRICKLY. See **PRICKLY PEAR**.

PEARL, a peculiar product of certain marine and fresh-water molluscs or shell-fish. Most of the

soft-bodied animals which are aquatic and reside in shells are provided with a fluid secretion with which they line their shells, and give to this substance hard granular material, of which the shell is formed, a beautifully smooth surface, which prevents any unpleasant friction upon the extremely tender body of the animal. This secretion is continually laid in successive thin semi-transparent films, which, in consequence of such an arrangement, have generally a pearly iridescence, and form in some species a soft and pliant, in others a hard and ornamental surface. The material itself in its hardened condition is called nacre by zoologists, and by dealers Mother-of-pearl by us. Besides the pearly lining of the shells, detached and generally spherical or rounded portions of the nacre are often found on opening the shells, and there is great reason to suppose these are the result of accidental causes, such as the intrusion of a grain of sand or other substance, which, by irritating the tender body of the animal, induces it to self-defence to cover the wound of offence, which is but no power to remove; and as the secretion goes on regularly to supply the growth and wear of the shell, the included body constantly gets its share, and thereby continues to increase in size until it becomes a pearl. The Chinese avoid the surface of the knowledge of this fact to supply our species of fresh-water pearls, *Uta Hyos*, by growing pearls. In order to do this they keep the Uta in tanks, and insert between the shell and the mantle of the animal certain small bodies of clay or little spherical pieces of mother-of-pearl. These are used to receive waste matter from the numerous secretion; and thus a time has like pearls formed under ordinary circumstances. These cultured pearls also practice another trick upon these animals; they insert small pieces of the shell slung out of shell, which has become coated with the pearl secretion, and incorporated by it to the shell; so that a fragment of the foreign substance is a superfluous testimony to the truth of the fact. Examples of these artifices are to be found in many of our specimens.

A plan of making pearls was suggested to the Government of Louisiana. It consisted in boring a small hole through the shell of the river mussel, and inserting a grain of sand, so as to afford a nucleus for a pearl. The plan at first succeeded admirably well to prove its practicability, and he was rewarded by a small money (\$400), but it failed in its practical completion, and was abandoned.

The exact nature of the secretion has never been satisfactorily determined; it is, however, ascertained that it is deposited in thin films, which overlap each other so irregularly, that their sharply serrated edges, when magnified, present the appearance represented in fig. 1, and to this peculiar disposition of the plates, the beautiful iridescence of common pearls is attributed. This formation was a great puzzle to the ancients, amongst whom they were very highly prized. Dioscorides and Pliny mention the belief that they were drops of dew or rain which fell on the shells when opened by the animal, and were thus allowed by some power of the animal to be made. This opinion, which obtained all over the east, is thus charmingly alluded to by Moore:

'Shall presume the dew to shed rain from the sky,
Which, borne into pearls, as it falls in the sea.'

The most famous pearls are those from the east; the

most of Ceylon, or Taprobane as it was called by the Greeks, having from the earliest times been the chief locality for pearl-fishing. They are, however, obtained now of nearly the same quality in other parts of the world, as Panama in North America, Margarita in the West Indies, the Laccadive Coast, the shores of the Indian Islands, the Balavia Islands, and the Islands of Karak and Corra in the Persian Gulf. The pearls of the Balavia fishery are said to be even finer than those of Ceylon, and they form an important part of the trade of Russia, Persia, and indeed all the foreign pearls used in jewellery are produced by the Pearl Oyster (*P. v.*). The shells of the molluscs which yield the Ceylon,

Fig. 2.

Indian, and Persian ones, are sometimes as much as a foot in diameter, and are usually about nine inches. Those of the New World, although the shells are smaller and thicker, are believed to be the same species. The chief locality of the Ceylon pearl fishery is a bank about 20 miles long, 10 or 12 miles from shore, opposite to the village of Comandry and Argo in the northern coast. The season of the fishery lasts about three months, commencing at the beginning of February, and is carried on under government regulations. The boats employed are open, and vary in size from 10 to 15 tons burden; they put out at night, usually at 10 o'clock, on a signal gun being fired from the fort of Argo, and make for the government guard vessel, which is moored on the bank, and serves the double purpose of a guard and a light-ship. The divers are under the direction of a manager, who is called the Adajanaar, and they are chiefly Tamils and Moors from India. For each diver there is provided a diving-stone, weighing about 50 pounds, which is fastened to the end of a rope long enough to reach the bottom, and having a loop made for the man's foot; and in addition to this, a large network basket, in which to place the pearl oysters as he collects them. These are hung over the sides of the boat; and the diver, placing his foot in the loop attached to the stone, liberates the ends of the rope, and with his net-basket rapidly descends to the bottom. To each boat there is usually allotted a crew of 12 men and 10 divers, 5 of whom are descending whilst the others are resting. This work is done very rapidly; for, notwithstanding the stories to the contrary, the best divers cannot remain longer than 30 seconds below, and few are able to exceed 60. The greatest depth they descend is 12 fathoms, and the usual depth about 9 fathoms. When the diver gives the signal by pulling the rope, he is quickly hauled up with his net and its contents. Accidents rarely happen; and as the men are very superstitious, their safety is attributed to the incantations of their shark-charmers, performed at the commencement of the fishing. Sir E. Tennent, however, attributes the rarity of accidents from sharks, usually so abundant in tropical seas, to the hush and to the excitement of the waters during

the fishery frightening away those dreaded creatures. The divers are sometimes paid fixed wages, others agree for one-fourth of the produce. When a boat-load of oysters has been obtained, it returns to shore, and the cargo, sometimes amounting to 20,000 or 30,000, is landed and piled on the shore to die and putrefy, in order that the pearls may be easily found. The heaps are formed in small walled compartments, the walls surrounding each being about one or two feet in height. Several of these compartments surround a small central enclosure, in which is a bath, and they slope towards this bath, and are each connected with it by a small channel, so that any pearls washed out from the putrefying mass by the rain may be carried into the bath. When the animals in the shells are sufficiently decomposed, the washing commences, and great care is taken to watch for the loose pearls, which are always by far the most valuable; the shells are then examined, and if any attached pearls are seen, they are handed over to the clippers, who, with pinchers or hammer, skilfully remove them. Such pearls are used only for setting; whilst the former, being usually quite round, are drilled and strung, and can be used for beads, &c. The workmen who are employed to drill the pearls also round the irregular ones, and polish them with great skill. The method of holding the pearls during these operations is very curious; they make a number of holes of small depth in a piece of dry wood, and into these they fit the pearls, so that they are only partly below the surface of the wood, which they then place in water. As it soaks up the water and swells, the pearls become tightly fixed, and are then perforated, &c. These operations are all carried on on the spot.

For many miles along the Condatchy shore, the accumulation of shells is enormous, and averages at least four feet in thickness. This is not to be wondered at, when it is remembered that this fishery has been in active operation for at least 2000 years. The place itself is exceedingly barren and dreary, and, except during the fishing season, is almost deserted; but at that time it presents an exceedingly animated spectacle; thousands of people, of various countries and castes, are here drawn together—some for the fishery, others to buy pearls, and others to feed the multitude. They chiefly reside in tents, so that it appears a vast encampment.

The pearls vary much in size; those as large as a pea, and of good colour and form, are the best, except unusually large specimens, which rarely occur, the most extraordinary one known being the pearl owned by the late Mr Hope, which measured two inches in length, and four in circumference, and weighed 1800 grains. The smaller ones are sorted into sizes, the very smallest being called seed-pearls. A considerable quantity of these last are sent to China, where they are said to be calcined, and used in Chinese pharmacy. Amongst the Romans, the pearl was a great favourite, and enormous prices were paid for fine ones. One author gives the value of a string of pearls at 1,000,000 sesterces, or about £8000 sterling. The single pearl which Cleopatra is said to have dissolved and swallowed was valued at £30,729; and one of the same value was cut into two pieces for earrings for the statue of Venus in the Pantheon at Rome. Counting down to later times, we read of a pearl, in Queen Elizabeth's reign, belonging to Sir Thomas Gresham, which was valued at £15,000, and which he is said to have treated after the fashion of Cleopatra; for he powdered it and drank it in a glass of wine to the health of the Queen, in order to astonish the ambassador of Spain, with whom he had laid a wager that he would give a more costly dinner than could the Spaniard.

During the occupation of Britain by the Romans this country became famous for its pearls, which were found in the freshwater mussel of our rivers. See FRESHWATER MUSSEL. Generally the pearls of this mollusc are small, badly coloured, and often valueless; but occasionally they occur of such beauty as to rival those of the pearl oyster. At present, in the Scotch rivers, the search for pearls is prosecuted vigorously and successfully, especially by a merchant, named Unger, of Edinburgh, who has brought Scotch pearls into great repute. He has collected specimens ranging from £5 to £90 each, and formed a necklace worth £350. In Scotch pearls of the highest quality, there is a pleasing pinkish tint, which is very permanent. The fishing for pearl mussels is by no means so dangerous or troublesome as for pearl oysters; usually they are found in the beds of streams, shallow enough to wade in, and so clear that they can be seen at the bottom. If too deep to remove with the hand, they are easily captured by putting a stick between their gaping shells, which instantly close upon it, and can be drawn out with it. So profitable is this pursuit becoming, that a great many persons are now engaged in it.

Very fine river pearls, known on the continent as Bohemian pearls, are found in the rivers Moldau and Wottawa. There is also a fresh-water pearl fishery in Bavaria, where the river Ilts yields at times very fine specimens. Even the most inferior pearls have a market value; for pearls can only be properly polished with pearl dust, and the inferior pearls are powdered for the purpose of polishing and rounding the finer ones.

False pearls are very admirable imitations, made by blowing very thin beads or bulbs of glass, and pouring into them a mixture of liquid ammonia, and the white matter from the scales of the Bleak, and sometimes of the Roach, and Dace. The proper way to prepare the pearl-matter is first to remove the scales of the lower part of the fish; these must then be very carefully washed, after which they are put to soak in water; when the pearly film falls off and forms a sediment at the bottom of the vessel, which is removed and placed in liquid ammonia for future use. This pearl mixture, when of the best quality, is very costly, being as much as £4 or £5 per ounce. For use, it is diluted with ammonia, and injected into the glass beads, so as to thinly coat them inside; afterwards the better kinds have melted white wax poured in, which renders them much more durable. The French and Germans produce in this way imitations of the finest oriental pearls of such beauty, that the most practised eye can hardly detect the difference. The bleak is procured in considerable quantities for this purpose from the Thames and other rivers in England. See BLEAK.

The invention of artificial pearls is due to a Frenchman, named Jaquin, in the time of Catharine de Medicis, and the manufacture is now chiefly carried on in the department of the Seine, where great improvements have lately been made, especially in the art of giving the irregular forms of large pearls to the glass-bulbs, and thus increasing the resemblance, and in removing the glassy appearance caused by the exterior glass coating, by exposing it for a short period to the action of the vapour of hydrofluoric acid. Mucilage of fine gum-arabic is also used instead of wax, which increases the translucency, gives greater weight, and is not liable to melt with the heat of the wearer's body—a defect to which those filled with wax are very liable.

Roman pearls differ from other artificial pearls, by having the coating of pearly matter on the

muscle in which it is attached by an adhesive substance. The art of picking them was derived from the Indians.

PEARL, a river of Mississippi, U.S., which runs about 100 miles north-north-west of New Orleans, and, turning south through the delta, empties it in the lower course into Louisiana, and empties into Mississippi Sound, near the outlet of Lake Pontchartrain. It flows nearly 300 miles through a fertile alluvial country, and is navigable to New Orleans, the mouth.

PEARL, ADRIAN. See PEARCE.

PEARL, DARLEY. See DARLEY.

PEARL, GYSTER (*Arctica or Melospira gysteri*), a lamellibranchiate mollusk, of the body *Arctica*, generally found—great numbers together—attached to submarine rocks at a considerable depth on the coasts of Arica, Peru, and important as producing almost all the pearls and all the mother-of-pearl of commerce. It is sometimes called the Pearl Mussel; but the family to which it belongs differs considerably both from that of mussels and from that of oysters, the valves of the shell being unequal, the hinge-line straight and long, and the pearly formation with two additional sockets, one of them small, and with a foot by which it produces a byssus. The P. G. is of an oblong oval form, longitudinally ribbed, and with numerous foldings when young which disappear when it is old. It attains a large size, and there are several varieties, the most important of which are named in the article MOTHER-OF-PEARL. The whole inside of the shell is covered with a thick layer of nacre or mother-of-pearl, compact and lustrous, forming indeed the chief part of the shell, and exhibiting very considerable variety of colour, most frequently white, but sometimes bluish-red. Pearls are formed of the same substance (see PEARL), and are generally, if not always, produced by eggs which have become sterile, and which remain lodged within the mollusk instead of being ejected into the sea.

The P. G. is not so common and scarce to be eaten. When taken from the sea it is commonly laid out in the sun to dry, that the pearls may be sought for after the shell is open.

The P. G. is not the only mollusk which produces pearls. The *Phoenix pinnata*—an oyster (family *Pectinaria* with thin translucent shell, which is used in China and elsewhere as a substitute for window glass—produces diminutive pearls. The Fresh-water Mussel (*sp. sp.*) of Britain produces pearls sometimes of considerable beauty and value; and numerous have occurred of pearls being found in oysters, &c., and even in limpets.

PEARL, SHELL. See MOTHER-OF-PEARL.

PEARL, WHITE. See WHITE COLOURED.

PEARSON, JOHN, an English poet of high celebrity, was born in 1612 at Moring, in Norfolk, in which place his father was rector, educated at King and King's College, Cambridge, where he took the degree of M.A. in 1639, and in the same year took orders, and was collated to a prebend in Ely Cathedral. In 1640 he was appointed chaplain to Charles, lord-keeper of the great seal, and of the exchequer at the civil war became chaplain to Lord Goring, and afterwards to Sir Robert Cook, in London. In 1650 he was appointed minister of St Clement's, Strand, London; and in 1659, published the great work by which he is now remembered, *A description of the Devil*. It was dedicated to his book, in whom the substance of it had been preached some years before in a series of sermons. The thorough learning and the judicious reasoning displayed by the author in this treatise have long been acknowledged, and command the

respect even of those who think his dateable argumentation tedious and not always forcible. It is generally reckoned one of the ablest works produced in the greatest age of English theology—the 17th century. During the same year, P. published *The Golden Rule of the New Testament*, *Mr John Donne of New*. At the Restoration, honours and emoluments were lavishly showered upon him. Before the close of 1660 he received the rectory of St Christopher's in London; was created M.A. of Cambridge; installed Professor of Holy and Archaic Learning at Murray; and made Master of Jesus College, Cambridge. In 1661, he obtained the Marginal professorship of Divinity, and was one of the most prominent commissioners in the famous Savoy conference; in 1662, he was made Master of Trinity, Cambridge, and in 1673 was promoted to the bishopric of Chester. The year before he had published his *Viridula Episcoporum in Decretis*, in answer to M. Hall, who had denied the genuineness of the epistles. It was imagined for years that P. had triumphed over his opponent. The history of the controversy, however, soon afterwards has shown that Hall was right and P. wrong. In 1681, appeared his *Devotio* (*Devotional*). He died July 16, 1686. His *Opera Poetica* were published by Dodwell (London, 1688), and his *Tractatus, Dissertationes et Disputationes Theologicae* contain much valuable matter; for, as Bentley used to say, P.'s 'very dress was gold.' Bishop Burnet thought him 'in all respects the greatest divine of his age.'

PEASANT WAR, in German history, the name given to that great insurrection of the peasantry which broke out in the beginning of the year 1525, and which Zschokke has described as the 'terrible scream of oppressed humanity.' The oppression of the peasants had gradually increased in severity, as the nobility became more extravagant and the clergy more sensual and degenerate. The example of Switzerland encouraged the hope of success, and from 1576 to 1517 there were risings here and there amongst the peasants of the south of Germany. A peasant rebellion, called from its originators, the *Bundschuh* (Laced Shoe), took place in the Rhine countries in 1502, and another, called the 'League of Poor Conrad,' in Wurtemberg, in 1514, both of which were put down without any abatement of the grievances which occasioned them. The Reformation, by the mental weakening which it produced, and the diffusion of sentiments favourable to freedom, must be reckoned amongst the causes of the great insurrection itself; although Luther, Melancthon, and the other leading reformers, whilst urging the nobles to justice and humanity, strongly reprobated the violent proceedings of the peasants. The Anabaptists, however, and in particular Munn, encouraged and excited them, and a peasant insurrection took place in the Hegau in 1523. Another, known as the 'Latin War,' arose in 1525 in Salzburg, against an unpopular archbishop, but these were quickly suppressed. On January 1, 1525, the peasantry of the abbey of Kempton, along with the townspeople, suddenly assailed and plundered the convent, compelling the abbot to sign a remission of his rights. This proved the signal for a rising of the peasants on all sides throughout the south of Germany. Many of the princes and princes at first regarded the insurrection with some measure of complacency, because it was directed in the first instance chiefly against the ecclesiastical lords; some, too, because it seemed likely to promote the interests of the exiled Duke of Wurtemberg, who was then upon the point of reconquering his dominions by the help of Swiss troops; and others,

because it seemed to set bounds to the increase of Austrian power. But the Archduke Ferdinand hastened to raise an army, the troops of the empire being for the most part engaged in the emperor's wars in Italy, and intrusted the command of it to the Truchsess Von Waldburg, a man of stern and unscrupulous character, but of ability and energy. Von Waldburg negotiated with the peasants in order to gain time, and defeated and destroyed some large bodies of them, but was himself defeated by them on the 22d of April, when he made a treaty with them, not having, however, the slightest intention of keeping it. Meanwhile the insurrection extended, and became general throughout Germany, and a number of towns took part in it, as Heilbronn, Mühlhausen, Fulda, Frankfurt, &c., but there was a total want of organisation and co-operation. Towards Easter, 1525, there appeared in Upper Swabia a manifesto, which set forth the grievances and demands of the insurgents. They demanded the free election of their parish clergy; the appropriation of the tithes of grain, after competent maintenance of the parish clergy, to the support of the poor and to purposes of general utility; the abolition of serfdom, and of the exclusive hunting and fishing rights of the nobles; the restoration to the community of forests, fields, and meadows, which the secular and ecclesiastical lords had appropriated to themselves; release from arbitrary augmentation and multiplication of services, duties, and rents; the equal administration of justice; and the abolition of some of the most odious exactions of the clergy. The conduct of the insurgents was not, however, in accordance with the moderation of their demands. Their many separate bands destroyed convents and castles, murdered, pillaged, and were guilty of the greatest excesses, which must indeed be regarded as partly in revenge for the cruelty practised against them by Von Waldburg. A number of princes and knights concluded treaties with the peasants conceding their principal demands. The city of Würzburg joined them, but the Castle of Leibbraunenberg made an obstinate resistance, which gave time to Von Waldburg and their other enemies to collect and strengthen their forces. In May and June 1525, the peasants sustained a number of severe defeats, in which large bodies of them were destroyed. The Landgraf Philip of Hesse was also successful against them in the north of Germany. The peasants, after they had been subjugated, were everywhere treated with terrible cruelty. In one instance a great body of them were perfidiously massacred after they had laid down their arms. Multitudes were hanged in the streets, and many were put to death with the greatest tortures. Weinsberg, Rothenburg, Würzburg, and other towns which had joined them, suffered the terrible revenge of the victors, and torrents of blood were shed. It is supposed that more than 150,000 persons lost their lives in the Peasant War. Flourishing and populous districts were desolated. The lot of the defeated insurgents became harder than ever, and many burdens of the peasantry originated at this period. The cause of the Reformation also was very injuriously affected. See Sartorius, *Versuch einer Geschichte des Deutschen Bauernkriegs* (Berl. 1795); Ochsle, *Beiträge zur Geschichte des Deutschen Bauernkriegs* (Heilbronn, 1829); Wachsmuth, *Der Deutsche Bauernkrieg* (Leip. 1834); and Zimmermann, *Allgemeine Geschichte des grossen Bauernkriegs* (3 vols., Stuttg. 1841—1843).

PEA-STONE, PISOLITE, or PISIFORM LIMESTONE, is a kind of calcareous spar or limestone, which occurs in globules from one-eighth of an inch to half an inch in diameter, imbedded in a cement of similar substance. There is generally

a grain of sand in the centre of each globule as the nucleus, around which it has been formed, and the concentric plates of its structure are easily visible. Sometimes the nucleus is merely a bubble of air. P. is found in great masses near the hot springs of Carlsbad, in Bohemia. It is sometimes used for ornamental purposes.

PEAT, a substance formed by the decomposition of plants amidst much moisture, as in marshes and morasses; and sometimes described as a kind of *Humus* (q. v.), formed by the accumulation of the remains of mosses and other marsh-plants. The remains of the plants are often so well preserved in it, that the species can be easily distinguished. Reeds, rushes, and other aquatic plants may usually be traced in peat, and stems of heath are often abundant in it; but it chiefly consists, in the northern parts of the world, of different species of *Sphagnum* (q. v.), or Bog-moss. Mosses of this genus grow in very wet situations, and throw out new shoots in their upper parts, whilst their lower parts are decaying and being converted into peat; so that shallow pools are gradually changed into bogs. It was at one time believed that bogs owed their origin to the destruction of forests, the fallen trees impeding the natural drainage, and causing the growth of those marsh-plants of which peat is formed; and this theory was supported by reference to instances supposed to be authenticated by tradition—as that of the moor of Hatfield in Yorkshire, now consisting of about 12,000 acres of peat, and said to have been a forest of firs, till 'the Romans under Ostorius, having slain many Britons, drove the rest into the forest,' which was then destroyed by the victors. There are, however, satisfactory proofs that peat has accumulated in many places around trees; and firs remaining in their natural position have been found to have six or seven feet of peat under their roots, although other trees, as oaks, are commonly found with their stumps resting on the soil beneath the peat. Yet it is not improbable that the destruction of forests may, in some instances, by impeding the course of the streams which flowed through them, have caused the stagnation of water from which the growth of peat resulted. Some of the largest mosses and fens of Europe occupy the place of forests, which were destroyed by order of Severus and other Roman emperors; and some of the British forests, now mosses, as well as some of those of Ireland, were cut because they harboured wolves or outlaws. The overthrow of a forest by a storm in the 17th c., is known to have caused the formation of a *peat-moss* near Loch Broom, in Ross-shire. Layers of trees are not unfrequently found in peat, which seem to have been suddenly deposited in their horizontal position, and sometimes to have been felled by human hands. It is not improbable, however, that sometimes peat has been formed where the soil has been exhausted by the long-continued growth of one kind of tree. The growth of peat is often rapid: bogs have been known to increase two inches in depth in a year. The surface of a bog sometimes becomes a floating mass of long interlaced fibres of plants, known in Ireland as *Old Wives' Toss*. The vegetation on the surface is sometimes very green and compact, like a beautiful turf.

Peat is vegetable matter more or less decomposed, and passes by insensible degrees into Lignite (q. v.). The less-perfectly decomposed peat is generally of a brown colour; that which is more perfectly decomposed is often nearly black. Moist peat possesses a decided and powerful antiseptic property, which is attributed to the presence of gallic acid and tannin, and is manifested not only in the perfect preservation of ancient trees and of leaves, fruits, &c., but sometimes even of animal bodies. Thus, in some

ancient human bodies have been found perfectly preserved in peat, since the lapse of centuries.

The formation of peat may be restricted to one of the most important geological changes now in actual progress. It takes place, however, only in the colder parts of the world. In warm regions, the decay of vegetable substances, after life has ceased, is too rapid to permit the formation of peat. The surface covered by peat is very extensive in all the colder parts of the world; although in the northern hemisphere no more seems to enter into its composition; and the South American peat is said by Mr Darwin to be formed of many plants, the chief of *Andia procumbens*, a phanerogamous plant of the rush family. The surface covered by peat even in England is considerable; it is greater in Scotland, and very great in Ireland. Extensive tracts are covered with peat even in the southern counties of Europe, and sometimes even near the sea, and in some northern regions the masses or bogs are still more extensive. For their physical characters, and the mode of extracting them, or converting them into fuel and land, see *peat*.

More peat is not a good soil, even when sufficiently drained, but, by the application of lime, &c., it is soon converted into good soil, yielding excellent crops. A mixture of peat is often of benefit to soils otherwise poor. And for many kinds of stock, leek, turnips, cabbage, &c., peat is as good as any soil; and is one of the best composts of peat, which is therefore in much request with gardeners in order to the formation of the soil for certain kinds of plants.

Peat is extensively used for fuel. The more perfectly decomposed that the vegetable matter is, and the more consolidated that the peat therefore is, the better it is suited for this use. It is the ordinary fuel of great parts of Ireland, and is there almost always called *torf*, although the term *torf*, in its ordinary English sense, is nearly inapplicable to it. To prepare peat for fuel, the portion of bog to be opened upon must first be properly drained by a well open drain; its surface is then paved off with the spade, to the depth of about six inches, to remove the coarse undecomposed vegetable matter; the peat is afterwards cut out in pieces (*peat*) like bricks, by means chiefly of a peculiar implement called an *Irish* or *Irish* spade, and in Scotland a *peat* spade, resembling a long narrow, sharp spade, the back of which is furnished on one side with a large set of a right angle to it. This implement is used by the labourer alone, without pressure of the foot. The cut peats are conveyed to some neighbouring place, where they are set up on end in little clusters to dry. When sufficiently dry, they are conveyed away, and may be piled in outhouses or stacked in the open air. The operation of peat-cutting is also performed in spring or summer—When peat for fuel cannot be obtained in the way just described, the black mud of a spent-fish bog is sometimes worked by the back of a party of men, women, and children until it acquires such a consistency that it can be moulded by the hand. The process is laborious, but the fuel obtained by it is good. The countries depending on peat for fuel, a very rainy season sometimes occasions great inconvenience, and even distress, by preventing the cutting and drying of the peat.

Peat is a light and bulky kind of fuel, and cannot be conveyed to considerable distance without too great expense. Efforts have, however, been made, both in Scotland and Ireland, to render it more generally useful, and so to promote the reclaiming of bogs, by compressing it until its specific gravity is nearly equal to that of coal. For this purpose, it is first reduced to a pulp. The compressing of peat

has not yet been advantageously presented on an extensive scale.

Peat charcoal, made from uncompresssed peat, is very light and inflammable, and therefore unsuitable for many purposes, but for others it is particularly adapted, and no kind of charcoal excels it in absorbent and desiccating properties. It is also an excellent manure for many kinds of soil, and great crops have often been obtained by its use. Peat charcoal is highly esteemed for the smoking of iron, and for smoking and tempering the finer kinds of pottery. Charcoal made from compressed peat is in density superior to wood-charcoal, and is capable of being used as such. The Irish Association Society, some years ago, for managed the conversion of peat into charcoal, but it seems not to have paid as a commercial speculation, although the resulting charcoal was of good quality. Various companies have since formed for the purpose of obtaining valuable products from the destructive distillation of peat. It appears from researches of Mr H. Kane and others, that 1000 parts of peat yield about 44 of sulphate of ammonia, 7 of acetate of lime, 2 of wood naphtha, 1 of pyrolic, 7 of fixed oil, and 8 of volatile oil. The manufacture has not, however, as yet proved sufficiently profitable to be generally adopted, although the distillation of peat has, we believe, been carried on for some years at Athy, near Kildare. For further details on this subject, the reader is referred to a parliamentary report on the *Nature and Products of the Destructive Distillation of Peat*, published in 1831, and to a paper by Dr Paul in the 6th volume of *The Edinburgh Review*.

Flower-pots are sometimes made of peat, and might perhaps with advantage be more extensively used than they have yet been. It is easy to transplant flowers growing in them without loosening the earth from the roots, the pot being readily cut to pieces, and liquid manure applied outside each a flower-pot finds its way sufficiently to the roots of the plant.

PEA WEEVIL, *Pisum sativum* and *R. lineatum*, small coleopterous insects, about a quarter of an inch long, which are very destructive to crops of peas and other kinds of pulses, devouring the leaves and other succulent parts, often even after the plants appear above ground. Their work is worst when done over the plants, prevent them in some measure from the ravages of these insects; and hoeing or other stirring of the soil is beneficial, probably by destroying the eggs, larvae, and pupae.

PEBBLE (probably allied to *balda*, from the sound of water running among stones), a small, round, water-worn stone of any kind; but with jewellers sometimes an agate—agate being often found as loose pebbles in streams, and those of Scotland in particular being popularly designated *Scottish Pebbles*. Hence the name has come even to be extended to rock-crystal, when not in the crystalline form, and we hear of spectacles with eyes of pebble, &c. Deposits of pebbles (in the sense of water-worn stones, occur among the rocks of all periods, but the pebbles are seldom large; they are generally cemented together by iron, lime, or silica, forming a pebbles-stone of greater or less hardness. Single pebbles are sometimes found in deposits which have been formed at a distance from currents in perfectly still water, as in chalk and fine silt. They must have been floated to their places entangled in the roots of trees, or attached to the roots of large buoyant sea-weeds.—*QUARTZITE* PEBBLES are called from their having been long famous for the purity of its rock crystal, are very pure pieces of black crystal (q. v.), used by opticians for making the lenses of spectacles, &c.

PECCARY—PECTORILOQUY.

PECCARY (*Dicotyles*), a genus of *Pachydermata*, of the family *Suidæ*, much resembling hogs; but having a mere tubercle instead of a tail; only three toes—no external toe—on the hind-feet; the molar teeth and incisors very like those of hogs, but the canine teeth not nearly so long, and not curving

Peccary (*Dicotyles torquatus*).

outwards. An approach to ruminants is seen in the stomach, which is divided into several sacs; also in the union of the metacarpal and metatarsal bones of the two greater toes into a kind of cannon bone. A glandular opening on the loins, near the tail, secretes a fetid humour. Only two species are known, both natives of South America, and except the tapirs, the only existing pachydermata of the American continent.—The COMMON P., COLLARED P., or TAJACU (*D. torquatus*), is found in almost all parts of South America; the WHITE-LIPPED P. (*D. labiatus*) is found in many parts of it. Both are gregarious; the White-lipped P., often assembling in very large herds, and sometimes doing great mischief to maize and other crops. The herds of the White-lipped P. seem to follow a leader, like those of ruminants. The Common P. chiefly frequents forests, and small companies sometimes take up their abode in the hollow of a great tree. The Common P. is about the size of a small hog, grayish; the hairs alternately ringed with black and yellowish white, bristly; and on the neck longer, and forming a mane. A narrow white collar surrounds the neck. The White-lipped P. is considerably larger, of a darker colour, with conspicuously white lips. The ears are almost concealed by the hair. Both species are capable of being tamed, but are of irritable and uncertain temper. In a wild state they defend themselves vigorously against assailants, making good use of their sharp tusks, and a whole herd combine for defence. The hunter has often to take refuge from them in a tree. They are omnivorous; and if hurtful to crops, render service by destroying reptiles. Their voice is somewhat like that of the hog, but more sharp. Their flesh resembles that of the hog, but is said to be inferior. The glands on the loins must be cut out immediately after the P. is killed, or their fetid humour infects the whole flesh. No attempts seem yet to have been made for the economic domestication of the peccaries.

PE-CHIH-LE'. See **CHIH-LE**.

PECK, a measure of capacity for dry goods, such as grain, fruit, &c., used in Britain, and equivalent to 2 imperial gallons, or 554.548 cubic inches. It is thus the fourth part of a Bushel (q. v.). The old Scotch peck, the 16th part of a boll, when of wheat, was slightly less than the imperial peck; but when of barley, was equal to about 1.456 of it.

PECORA (Lat. cattle), a Linnæan order of Mammalia, now generally called **RUMINANTIA** (q. v.).

PECOS, a river of Texas, U.S., rises in the mountains near Santa Fé, New Mexico, runs south-

easterly 600 miles through New Mexico and Texas, and flows into the Rio Grande-del-Norte, in lat. about 29° 20' N., long. 102° W.

PECTEN, a genus of lamellibranchiate molluscs, commonly referred to the same family with the oyster (*Ostrea*), which is sometimes called *Pectinidæ*. The shell has neither teeth nor laminae in the hinge; the valves are unequal, one of them being often much more convex than the other; the shape is regular; the hinge is extended by ears, and in most of the species both valves have ribs radiating from the umbo to the margin. Hence the name *pecten* (Lat. a comb), from the appearance which they present. The animal has a small foot; some of the species are capable of attaching themselves by a byssus; they are capable also of locomotion by opening and rapidly closing the valves, and in this way can even regain the sea from a short distance by leaping on the shore. Some of the larger species are often popularly called *clams*, a name shared by other bivalves. *P. Jacobæus*, a native of the Mediterranean, is the SCALLOP-SHELL which pilgrims were accustomed to wear in front of their hat, in token of their having visited the shrine of St James at Compostella. It attains a size of about 4 inches long and 5 inches broad. *P. mazinus*, found on many parts of the British coasts, is about 6 inches broad. It is sometimes eaten, but is hard and indigestible. Several other species are British. Species are found in almost all parts of the world.

Pecten.

PECTIC ACID AND PECTINE. See **FRUITS**.

PECTINIBRANCHIATA (Lat. comb-gilled), an order of gasteropodous molluscs, having the gills composed of numerous leaflets or fringes, arranged like the teeth of a comb, and affixed to the internal surface of a cavity which opens with a wide opening above the head. The sexes are distinct. All the P. have two tentacles and two eyes, the eyes often stalked. The mouth is produced into a proboscis, more or less lengthened. The eggs are deposited in a mass, with an envelope often of very remarkable and complicated form, which is produced by coagulation of a viscous albuminous matter secreted by a peculiar gland of the female. The P. are very numerous; the greater number of gasteropods being included in this order; some have a siphon, and some are destitute of it; some have spiral, and some have simply conical shells. Almost all are inhabitants of the sea or its shores; a few are found in fresh water. To this order belong *Whelks*, *Periwinkles*, *Cones*, *Volutes*, *Calyptææ*, &c.

PECTORILOQUY is a term of such frequent occurrence in the history of chest diseases as to require a brief notice in this work. If the stethoscope be applied to the chest of a healthy person, and he be requested to speak, the sounds of his voice will be conveyed to the ear of the observer with very different degrees of clearness, according to the part of the chest on which the base of the instrument rests. If, for example, it be applied at the top of the sternum or breast-bone the voice will reach the ear, through the tube, with tolerable distinctness. For a short distance on either side of the sternum, just below the collar-bones, and in the arm-pits, the voice is still heard, but the sound is indistinct and confused. Below the third rib, and over the remainder of the chest, the voice only

produce an intense throbbing sound which is known as *pericardial resonance*. In certain morbid conditions the sounds of the valve seem to proceed with a *diastolic murmur* from the walls of the heart directly into the lung; and thus, in place of the normal pericardial resonance, we have the physical sign known as *pericardiology* (from the Latin *pericardium*, from the heart, and *logos*, I speak). It occurs when a inflexibly superficial circulation, or moderate or considerable one, is under the anthescopy; and hence it was at one time regarded as an almost certain indication of advanced consumption, but it is now known that it may also occur when solidified masses of lung lie between a large bronchial tube and the part of the chest on which the instrument rests.

PECULIAR (Fr. *peculier*, i. e., private) is, in English Law, a particular parish or church having jurisdiction within itself, and exempt from the jurisdiction of the ordinary. The Courts of Consistory in some jurisdictions amount to about 300 in England and Wales, and had jurisdiction in reference to matters of wills before the recent constitution of the Court of Probate. Their jurisdiction is still somewhat obscure.

PEDAL (Lat. *pes*, = foot), any part of a musical instrument acted on by the feet. The *pedalboards*, the keys, and the organ are furnished with pedals, which, however, serve an entirely different purpose from the instrument. In the *pedalboards*, their object is to effect a change in the quality or intensity of the sound; the *pedal* prolongs the sound after the finger is lifted from the key, and the *shifting* or *pedal* *board* pedals within the tube. The pedals of the organ are the means by which the diastolic nature of intonation are effected. In the organ, the pedals are kept in action by the feet. The division of the organ which is connected with the feet is called the *pedalboard*, and contains the largest pipes. The introduction of pedals in the organ is assigned to a German of the name of Bach, who flourished in the 17th c.; they were long of being brought into use in England, but were long known, except those of the smallest dimensions, to make without them. Pedals are also used in the organ to act on the swell and on the stops for the organ.

PELVIC CURE. See *DOCTORAL*.

PEDAL POINT, or **PEDAL HARMONY**. See *ORGAN*.

PEDDER, **GURAP**, a river of North and South Carolina, U.S., rises in the Alleghany Mountains, to the north-west of North Carolina, and running south by east flows through the east portion of North Carolina, and enters the Atlantic through *Wilmington Bay* at *Wilmington*. It is navigable to *Charleston*, 150 miles, and is about 250 miles in length. —The **LITTLE PEDDER**, its principal eastern branch, is formed by the confluence of several smaller rivers in the south part of North Carolina.

PEDESTAL, a base or block on which columns, statues, &c., are frequently set. The pedestal is much used in classic architecture. Like the column, it has a base, *a*, and a sort of capital or cornice, called the *entablature*, *c*. The shaft, or plain block, *b*, is called the *body* or *shaft*.

PELAGIUM or **PELAGIUM**, a genus of island quadrupeds of the family *Muridae*, allied to

Larissa, but differing from them in some of the characters of their dentition. The hind legs, although very long, are not as long as in the *Larissa*. The tail is long. The *PELAGIUM* *HABIT* (*P.* or *H.* *capensis*) of South Africa is about the size of a rabbit. It can jump 50 or 60 feet at a bound. The forefeet also are very strong and it moves very expeditiously. The claws are long and strong. The habits of the animal are nocturnal, and it is thus considerable mischief in corn-fields and gardens.

PEDICELLARIES are very remarkable minute appendages of the instruments of many of the Echinoderms, having the form of a stalk, with a small two-bladed or three-bladed frond at the summit. They are of a fleshy substance, with numerous granules included; and in a living state the blades are continuously opening and closing. They were at one time supposed to be parasitic mycelites, but are now generally believed to be organs of the starfish or sea-urchin, although their use is merely conjectured to be that of keeping the surface of the skeleton free of algae and mycelites. The introduction of a pin's point between the blades causes an instantaneous closing of them. They are found both on shells and on comparatively soft invertebrates, and are always present, and always of a particular form, according to the species of skeleton, and according to the particular place which they occupy, being crowded chiefly around the apices, and near the mouth of sea-urchins.

PEDICULARIA, a genus of herbaceous plants of the natural order *Scrophulariaceae*, some of which have rather large and finely-colored flowers. Two species, *P. palustris* and *P. edulis*, are natives of Britain, common in wet grounds. Both have received the name of *Lamewort*, the English equivalent of 'pedicularis,' from their supposed influence in producing the lousy disease in sheep; an influence purely imaginary. Their acridity renders

Pedicularis palustris :

a, stamen, cut open, showing the filament; b, pistil; c, petal.

them injurious to sheep which eat them. Continental Europe and the northern parts of America possess many other species, and some are found in North America. *P. asperum*, or *King Charles's Broom*, is one of the principal ornaments of marshy grounds in the most northern countries of Europe.

PEDI'COLUS. See LOUSE.

PEDIGREE (probably from Lat. *pes*, a foot), a tabular view of the members of a particular family with the relations in which they stand to each other, accompanied or unaccompanied by a notice of the chief events in the life of each, with their dates, and the evidence of the facts stated. Pedigrees are indispensable aids to the student of history. The wars of the Roses, the claim of Edward III. to the crown of France, the relative position of Mary and Lady Jane Grey, the circumstances which brought about the union of the crowns of England and Scotland, the Schleswig-Holstein question—now occupying the attention of Europe—and many other familiar chapters in the history of nations, as well as of families, cannot be read aright without the aid of pedigrees. The materials to be used in the formation of a pedigree are notes of the facts to be set forth, and a recognised series of signs and abbreviations. These notes comprise the name of every person who is to appear in the pedigree, with such dates and circumstances as it may be considered desirable to record. Among the commonest abbreviations are *dau.*, for daughter of; *s.* and *h.*, son and heir of; *coh.*, coheir of; *w.*, wife of; *s. p.* (*sine prole*), without issue; *v. p.* (*vitâ patriâ*), in his father's lifetime; *b.*, born, *d.*, died; *dep.*, deposed; *K.*, king; *E.*, earl, &c. The sign = placed between two names, indicates that they were husband and wife; ∇ indicates that they had children; \downarrow under a name signifies that the person had children. All persons of the same generation are to be kept in the same horizontal line; and the main line of descent is, wherever possible, to be indicated by keeping the successive names in a vertical column. Continuous lines indicate the succession of the different generations. The members of the same family are generally arranged in their order of birth in two groups—the sons first, and then the daughters; but where the same father or mother has children by more than one marriage, the children of each marriage ought to form distinct groups. The actual arrangement, however, of a pedigree must always depend on the leading object which it is intended to illustrate.

Tabular genealogies, generally brief, and meant to illustrate some particular claim of right, are found among the records, public and private, of the early middle ages; but after the incorporation of the English Herald's College, far more attention was devoted to the compilation of pedigrees of families, more particularly with reference to their claims to dignities and heraldic insignia. In the course of the 16th c., the heralds obtained copies of all such accounts of the English families of any distinction as could be supplied to them, and entered them in the books which contain the records of their official proceedings. Royal commissions were issued under the Great Seal to the two provincial kings-of-arms, empowering them to visit in turn the several counties of England, in order to collect from the principal persons of each county an account of the changes which had taken place in their respective families in the interval since the last preceding visitation, and to inquire what account could be given of themselves by families who had stepped into the rank of gentry, or had become settled in the county since that period. The register-books kept by the heralds and their assistants contain the pedigrees and arms collected in the course of the visitations, with the signatures of the heads of the families. The pedigrees thus collected contain a vast body of information, interesting not only to the professed genealogist, but to every one who would know anything of the distinguished

characters in English history. Some of these books are lost, the rest are scattered among the public and private libraries of the country, the largest collections being in the archives of the College of Arms and the British Museum. After the beginning of last century, the visitations were discontinued, and there has since been no official and regular collection of pedigrees. A standing order of the House of Lords, in 1767, required that before any peer should be allowed to take his seat, Garter-king-of-Arms was to deliver at the table of the House of Lords a pedigree of his family, to be verified by the Committee of Privileges, and eventually preserved in the records of the House, a copy being also registered in the College of Arms. This order was rescinded by Lord Thurlow in 1802, with the view of framing a new one; but, unfortunately, this was never done. Persons sensible of the importance of preserving an authentic account of their descent, frequently record their pedigrees for preservation in the Register of the College of Arms. This register is quite distinct from the heraldic department of that institution, and is open to any one who wishes to preserve evidence of any properly authenticated facts regarding his descent and family.—In Scotland, in the absence of the regular system of visitations which prevailed in England, there is a great deal of evidence regarding the pedigrees of the historical families of the country scattered here and there in public and private collections, including the Advocates' Library and Lyon Office. A register of genealogies, similar to that of the English Herald's College, exists in the Lyon Office, in which the pedigrees of applicants, after being proved to the satisfaction of the heraldic authorities, are inserted with the accompanying evidence. 'To what extent the register of genealogies in the Lyon Office may be admitted as a probative document, conclusive of the facts which it sets forth, has not been ascertained by actual decision; but there can be no doubt that, in questions both as to property and honours, it would be regarded as a most important admiciple of proof. The genealogical department of the Herald's College in London is a very important one, and it is to be regretted that the uses of the corresponding department of the Lyon Office are so little understood and appreciated by the public.'—*Lorimer's Handbook of the Law of Scotland*, 2d edit., p. 446.

PEDIGREE, in point of law, is the legal relationship between individuals which is looked to with regard to the descent of property and honours. The occasion in which it comes into question is where a person dies, in which case his property, if he died intestate, is divided among those who are related by blood. The real property goes to one set of relations, and the personal property to others. See **INTESTACY**, **NEXT OF KIN**, **SUCCESSION**, *Paterson's Comp. of English and Scotch Law*, 251, 257.

PE'DIMENT, the triangular space over the portico at the ends of the roof of classic buildings. It is enclosed by the horizontal and the *raking* cornices, the latter of which follow the slopes of the roof. The pediment may be called the gable of classic buildings. It is frequently enriched with sculpture, for which it forms a fine setting. The doors and windows of classic buildings are often surmounted by pediments, either straight-sided or curved.

PEDLERS. See **HAWKERS**.

PEDO'METER, an instrument for measuring walking distances. It sometimes has a watch or clock attached. In the patent pedometer of Messrs Payne, William, & Co., there is a repeating watch,

which shows records, customs, and laws, and also the days of the month. They are used by peasants and by manorial lords when the time of hired carriages are desired. See *Quintana*.

PEDRO I. (DOM PEDRO D'ALFONSO), Emperor of Brazil, and the second son of John VI., king of Portugal, and was born at Lisbon, 12th October 1798. On the death of his elder brother in 1820, he became Prince of Beja, and heir to the throne; and after his father's accession to the throne of Portugal and Brazil in 1816, he received the title of Prince of Brazil. He was married along with the rest of the royal family of Portugal to their flight to Brazil in 1807, and from that time remained in that country. The situation, owing to political disturbances, was not suited to him, and after his arrival in Brazil, he was left to instruct himself very much according to his own inclination. In 1817, he married the Archduchess Leopoldine of Austria, and on his father's return to Lisbon in 1821, was named Regent of Brazil. At this time a great political crisis was impending; the Brazilians had been severely disgusted at the preference of Portuguese to the highest offices of state and the chief judicial dignities, and their discontent was heightened by the refusal of the Portuguese Cortes to accord to Brazil a liberal constitution similar to that which had been granted to the mother country, and by its arbitrary command, that P., who was at the head of the liberal party, should at once return to Portugal to complete his education. P., however, not in accordance with the Cortes, despite threats of excommunication from the throne of Portugal, and was named, on 12th October 1822, Emperor of Brazil. His government was very rigorous, but a war which broke out between his supporters and the ultra-royalists, distracted the country for a time, and prevented the liberal measures of the government from taking full effect. In 1823, his title was recognized by the Portuguese Cortes; and the death of his father, in the following year, opened for him the succession to the throne of Portugal. This revived the national spirit of the Brazilian Chambers, who feared that they were about to be again reduced to a dependent state, and P.'s hasty and passionate temper led him to measures which excited the general discontent. But he nearly retained the dignity of King of Portugal long enough to shelve his right to it, and, after granting a more liberal constitution, immediately resigned in favour of his daughter, Maria II. (q. v.). The disturbances in Brazil still increased, the finances fell into disorder, the emperor's second marriage with the Princess Anne of Leuchtenburg, displeased his subjects; and although he variously instituted attempts to restore the policy, he was compelled, by the revolution of 24th April, to resign the throne in favour of his son, Pedro II., a boy of 5 years old. P. then sailed for Portugal, where his brother Miguel had usurped the throne, and with the aid of an army which was aided by French and English volunteers, after a three years' campaign, he drove away the usurper, and restored his daughter to the throne in 1834. But the constant parliament by which he had been surrounded, and the excessive demands on his energies, had produced total exhaustion; and he died 26th September 1834. See *BRASIL*; *MIQUEL*, *DUE*; and *PORTUGAL*.

PEDRO-DE-SEA-FLORES. See *FLORES*.

PERLUM. See *PERLUMON*.

PERLUMONTH. a county in the south of Ireland, also called Tweekill, from consisting mostly of the upper valley of the Tweek, a river which originates in the county. P. is bounded by

Dunstrut and Mullagh shores on the S., Loughshole on the W., Mid-Lifford on the N., and Rathfriland on the E. The county is small, containing only 534 square miles, or 272,360 statute acres. Its lowest point above the mean level of the sea is about 450 feet, from which to 1380 feet is the region of cultivation; but the county being a group of hills, is mostly pastoral, with the fertile lands chiefly in the valleys. The highest hill is Broad Law, which reaches an elevation of 2754 feet. Within the county the Tweek has few tributaries; the small rivers Kilduff, Lifford, Queen, Moun, and Lym, besides many mountain rivulets. P. comprehends various parishes, but several being ecclesiastically united, the number of parish churches, each with a settled minister, is fourteen; the number of parish schools is fifteen. The only town in the county is Doolin, an ancient royal borough pleasantly situated on a peninsula formed at the confluence of the Kilduff with the Tweek. The principal villages are Inverlifford, Walker Burn, West Lifford, and Lifford. In 1831, the population of the county was 11,493, of whom about 2300 belonged to Dublin, whom, distant 22 miles from Kilduff, is the seat of a sheriff and county administration. It is also the seat of a presbytery. Besides the parish church, the town has several dissenting places of worship, including an Episcopal and a Roman Catholic chapel. It likewise possesses some good schools, has three branch banks, and a number of inns. As a centre of literary and social improvement, Mr W. Chambers, in 1825, made a free gift to his native town of a spacious suite of buildings, comprising a reading room, a Public Library containing 10,000 volumes, a Museum, Gallery of Art, and Hall for lectures and concerts; the whole being designated the City of the Overgreen. Long excluded from general traffic, P. has been lately opened up by railways; and the woolen manufacture has made considerable progress in the parish of Inverlifford. In 1853, the valued rental of the county, towns included, exclusive of railway property, was £96,754. 5s. 1d. P. abounds in the remains of British hill-forts, border towers, and other antiquities, and possesses numerous modern mansions of a handsome kind. Hitherto, the only account of the shire has been a *Description of Tweekill*, by Dr Alexander Pennington, 1713; revised with notes, 1815; but in the present year (1864) has been written a *History of Perlum*, by W. Chambers, 1 vol. 8vo, illustrated with maps and wood-engravings.

PERL, a small but populous and thriving seaport town on the west coast of the Isle of Man. It was formerly called 'Hulm,' and was a place of great importance in the island. The herring-fishery, the building of vessels of small tonnage, and the manufacture of nets, are here carried on extensively, and form a source of large profit to the inhabitants. The bay is spacious, and abounds with fish of excellent quality.

At the northern extremity of this bay are several grotesque and romantic caverns. The southern extremity is formed by Peel Island, on which stand the grand old ruins of Peel Castle and St German's Cathedral. The castle was formerly the frequent residence of the Earls of Derby, then Lords of the Isle of Man, and is expressly named in the original grant of Henry IV. to the Stanley family. Beneath the cathedral is a strong subterranean dungeon, where many noble persons were in former days imprisoned, including Thomas, Earl of Warwick, in the time of Richard II., and Elmer Cobham, Duke of Gloucester, who was sentenced to perpetual imprisonment in it in the year 1440, and who died within its gloomy recesses. In Sir Walter

Scott's *Peveril of the Peak*, constant mention is made of this castle, and indeed it may be said to be the scene of the story. The ruins are yearly visited and admired by thousands of persons from all parts of the United Kingdom. The town of P. is now rapidly extending its boundaries, and bids fair to become a place of considerable commercial importance. Population (1861) 2818.

PEEL, SIR ROBERT, a very eminent British statesman, was born, 5th February 1788, near Bury, in Lancashire. His father, Sir Robert Peel (created a baronet in 1800), was a wealthy cotton-spinner, from whom he inherited a great fortune. He was educated at Harrow, and at Christ-Church, Oxford, where he graduated B.A. in 1808—taking a double first-class—and entered the House of Commons in 1809 as member for Cashel, adopting the strong Tory politics of his father. Percival was then prime-minister. P. set quietly about the business-work of the House, feeling his way with that steady prudence and persevering diligence that were the conspicuous features of his character. In 1811, he was appointed Under-secretary for the Colonies; and from 1812 to 1818, he held the office of Secretary for Ireland. In this capacity, he displayed a strong anti-Catholic spirit (whence the witty Irish gave him the nickname of 'Orange-Peel'), and was in consequence so fiercely, or, shall we say, ferociously attacked by O'Connell, that even the cool and cautious Secretary was driven to send the agitator a challenge. The police, however, prevented the duel from taking place. From 1818 till 1822, P. remained out of office, but not out of parliament, where he sat for the university of Oxford. He now began to acquire a reputation as a financier and economist; and in 1819, was appointed chairman of the Bank Committee, and moved the resolutions which led to the resumption of cash-payments. He was still, however, as averse as ever to anything like religious or political reform. No member of the Liverpool-Castlereagh cabinet could have been to appearance more resolute. He even vehemently defended the infamous 'Peterloo Massacre' of 1819. In 1822, he re-entered the ministry as Home Secretary—Canning shortly after becoming Foreign Secretary, on the suicide of Lord Castlereagh. The two worked together pretty well for some time, as P. devoted himself chiefly to financial matters, and especially to the currency; but 'Roman Catholic emancipation' was a question on which Canning was considerably in advance of his brother-secretary; and when the former was called upon by the king, after the resignation of Lord Liverpool, to form a sort of Whig-Tory ministry, P., along with the Duke of Wellington and others, withdrew from office. Yet it is singularly characteristic of this most honest and *compromising* statesman, that even when he seceded (1827), his opinions were veering round to the liberal and generous view of the claims of Roman Catholics; and when the death of Canning, shortly after, led to the formation of the Wellington-Peel government, its great measure—actually introduced by 'Orange-Peel' himself—was the ever-memorable one for the 'relief' of the Roman Catholics (1829). As Home Secretary, he also signalised himself by a re-organisation of the London police force—since popularly called 'Peelers' and 'Bobbies,' their previous sobriquet being 'Charlies'—from King Charles I., who (1640) extended and improved the police system—and by the introduction of several other important measures.

Meanwhile, the university of Oxford had rejected its apostate representative, and chosen in his stead Sir Harry Inglis. But now came on the great question of parliamentary reform, which P. firmly

but temperately opposed. In 1830, the Wellington-Peel ministry fell, and was succeeded by a Whig ministry under Earl Grey, which, in 1832, carried the Reform Bill. P. (now, by the death of his father, Sir Robert P.), when he saw that reform was inevitable, accepted defeat and its results with great equanimity. He shrank from anything like factious opposition to the measure, and contented himself with presenting as forcibly as he could the political *per-contra*. After it was passed, he became the leader of the 'Conservative' opposition; and, as we have said, accepting reform itself as a *fait accompli* and irreversible, he only sought by keen and vigilant criticism of Whig measures to retard the too rapid strides of liberalism. In 1833, when the first 'reformed' parliament assembled, P. took his seat as member for Tamworth, which he represented till the close of his life. On the retirement of the Melbourne ministry in November 1834, he accepted the office of prime-minister, but could not succeed in giving stability to his administration, and was compelled again to give place to Viscount Melbourne in April 1835, and resumed his place as leader of the opposition. P.'s conduct in opposition was always eminently patriotic. The Whigs, who were being pressed on the one side by the new Radical party and the Anti-corn Law League, and on the other by O'Connell and the Irish repealers, gradually lost ground, and being narrowly defeated in 1841, on a motion of want of confidence, dissolved parliament. The general election that ensued, was virtually a contest between Free-trade and Protection. Protection won; and when the new parliament met, a vote of no-confidence was carried by a majority of ninety-one. The Conservative party, headed by P., now came into office. The great feature of the new government was the attitude it adopted on the corn-law question. The Whigs, while in office, and even after their expulsion, were bent upon a fixed but moderate duty on foreign corn; the Anti-corn Law League would hear of nothing short of an entire repeal, while Sir Robert was in favour of a modification of the sliding scale of duty which had existed since 1828. He introduced and carried (1842), in spite of strong opposition, a measure based upon this principle. The deficit in the revenue, which had become quite alarming under the Melbourne administration, next engaged his attention, and led him to bring in a bill (1842) for the imposition of an 'income-tax' of 7d. in the pound, to be levied for three years. To alleviate the new burden, P. commenced a revision of the general tariff, and either abolished or lowered the duties on several very important articles of commerce, such as drugs, dye-woods, cattle, sheep, pigs, salted meat, butter, eggs, cheese, and lard. He also shewed himself resolute in the repression of the clamorous and anarchic malcontents of Ireland. O'Connell (q. v.) was tried for conspiracy, and though the judgment against him was set aside on appeal to the House of Lords, the influence of the 'agitator' was broken. The first half of 1845 was marked by the allowance to Maynooth being increased and changed into a permanent endowment instead of an annual grant, and by the foundation of the Irish unsectarian colleges, and other important measures. But the potato-rot in Ireland during the autumn, followed by a frightful famine, rendered 'cheap corn' a necessity, if millions were not to starve. Cobden and the League redoubled their exertions. Lord John Russell denounced the views of the Whig party on the crisis, and Peel again yielded. He told his ministerial colleagues that the corn-laws were

donor, and that their reward was inevitable. Some of them returned to parliament with him, as resigned; but after a few days, they recalled, and resumed office. Lord Stanley (now Earl Derby) resigned, and was Lord Stanley of Bantock. Mr. Russell, &c., having a "conscience" Tony party; but the lords of Wellington, Graham, Aberdeen, Gladstone, and other eminent Conservatives, stood by him, and the measure for the repeal was carried. He was, however, immediately afterwards defeated on a trade Protection of Life Bill. Not so much from the sword, as because he felt that the measure which he had proposed had produced a dissolution of the union of party, and that he could not expect for some time to find himself at the head of a strong government. He retired from office in June 1846, spring (came to a Whig administration under Lord John Russell, in which he gave an independent but general support as the leader of a middle party rather Whig than Tory. In the critical time of 1847-1848, he was one of the most important props of the government, whose free-trade principles he had now completely accepted. His economical policy had also undergone a remarkable change, and he now frankly supported the Whigs in the efforts to carry an act for the repeal of the Jewish disabilities. He was himself regarded by the working and middle classes generally with much grateful respect. An unexpected catastrophe put an end to his career. On the 25th of June 1856, he had spoken with great assurance in the debate on Lord Palmerston's Greek policy, but on the following day was thrown from his horse in Hyde Park, and was so much injured, that he died on the evening of the 23 of July. He left five sons, the eldest of whom, Sir Robert Peel, and the second, Viscountess, are both members of the House of Commons, and have adopted generally the line of Whig politics of their father.

PEEL-TOWER (*W. pill*, a stake, a fortress; *Lat. pill*, a stake, pillar, structure), the name given to the towers erected on the Scottish borders for defence. They are square, with turrets at the angles, and the door is sometimes at a height from the ground. The lower story is usually vaulted, and formed a stable for horses, cattle, &c. For an account of these old towers, now mostly in ruin, see *History of Peebles*, by W. Chambers, 1661.

PEEPOL, PEPUL, or PIPUL (*Ficus religiosa*), also known as the Sacred Fig of India, and in Ceylon called the Bo Tree; a species of Fig (q. v.), somewhat resembling the Banyan, but the branches are rounder like those of that tree, and the leaves are clasped with long attenuated points. The tree is held sacred by the Hindus, because Vishnu is said to have been born under it. It is generally planted near temples, and religious devotees spend their lives under its shade. It is also held sacred by the Buddhists. It attains a great size and age. A wonderfully aged tree of this species is figured in the *Illustrations de l'Inde*. The P. is often planted near houses, and by the sides of walks, for the sake of its grateful shade. The juice contains mentholum, and is used by women as perfume. Lar insects feed upon this tree, and much lac is obtained from it. The fruit is not much larger than a grape, and almost tasteless, is not valued.

PEER (*Fr. pair*; *Lat. par*, equal), a general name applied to the titled nobility of Great Britain and Ireland, indicating their equality of rank. The peers include the various degrees of Baron, Viscount, Earl, Marquis, and Duke. The peers of Great Britain, of Great Britain, of the United Kingdom, and certain representative peers of Scotland and Ireland, together with certain of the bishops and

archbishops, who are called lords spiritual, constitute the House of Lords. The dignity of the peerage is hereditary, but in early times was hereditary. Life peerages seem at one time to have been not unknown in England, but in 1550 Sir James Parkes, having been created by Her Majesty Blanche Woodville for and during the term of his natural life, the House of Lords, on the report of a Committee of Privileges, held that he was not entitled to sit and vote in parliament. Ladies may be peers in their own right either by creation or by inheritance. The wives of peers are also styled peeresses. Under the articles NUMBER, PARLIAMENT, PEER, MARQUIS, EARL, VISCOUNT, and BARON, will be found notices of each order of peer, and of the origin, history, and privileges of the peer as a body.

A certain limited number of the French nobility were styled Peers of France.

PEEWIT, *See* LARVAE.

PELAGIUS, or PACASSE (*Ras pascasi*), a species of ox, a native of the interior of Western Africa. The head is short and thick, the forehead wide; the horns long, extending laterally from the frontal ridge, then turning downwards, and again upwards; the ears very large and pendulous; the neck muscled; the tail entirely covered with long hair; the legs long. Little is yet known of this curious species of a most important tribe.

PEGASUS, in Greek Mythology, a winged horse which arose with Chryseus from the blood of the Gorgon Medusa, when she was slain by Perseus. He is said to have received his name because he first made his appearance beside the springs (pegai) of Oceanus. He afterwards ascended to heaven, and was believed to carry the thunder and lightning of Zeus. According to later authors, however, he was the horse of Poseidon. The myth concerning P. is interwoven with that of the victory of Heracles over Chimera. Beloschophos had in vain sought to slay P. for his combat with this monster, but was advised by the seer Polydorus of Corinth to sleep in the temple of Minerva, and the goddess appearing to him in his sleep, gave him a golden bridle and certain instructions, upon which he acted, and made use of P. in his combat with the Chimera, the Amazon, and the Scylla. P. is also spoken of in modern times as the horse of the Muses, which, however, he was not. The ancient legend on this subject is, that the nine Muses and the nine daughters of Pierus engaged in a competition in singing by Helicon, and everything was motionless to hear their song, save Helicon, which rose over higher and higher in its delight, when P. put a stop to this with a kick of his hoof, and from the point arose Hippocrene, the inspiring spring of the Muses. But that P. is the horse of the Muses, is entirely a modern idea, being first found in the *Orlando Furioso* of Boissier.

PEGASUS, a genus of fishes, constituting the

Sea Dragon (*Pegusus draco*).

family *Pegusidae*, of the order *Lepidosteichthi* (q. v.). The species are few; they are small fishes, natives of the Indian sea, interesting from their peculiar form

and appearance. The breast is greatly expanded, much broader than high, the gill-openings in the sides; the pectoral fins are extremely large and strong; a long snout projects before the eyes, and the mouth is situated under and at the base of it; the body is surrounded by three knobbed or spinous rings. One species (*P. draco*) is called the SEA DRAGON, another (*P. volans*) is popularly known as the PEGASUS.

PEGS. Small square pointed pegs of wood have of late years been introduced by the Americans into the manufacture of boots and shoes, for the purpose of connecting the parts of the sole and upper leather together without sewing. See SHOEMAKING. This invention has been so extensively adopted, that the manufacture of wooden pegs, for this purpose, has become an important trade in America and Bohemia, from which countries a considerable importation is made to Great Britain. They are chiefly made of maple-wood, and are rarely more than an inch in length.

PEGU', a province of British Burmah, lies between the parallels of 15° 14'—19° 27' N. lat., and the meridians of 94° 13'—96° 52' E. long., and is divided for fiscal purposes into the following districts or provinces:

	Area in Square Miles.	Population, 1862.
Rangoon,	9800	252,507
Basscin,	8900	225,876
Prome,	5494	232,867
Henzada,	2300	118,614
Tharawady,	2160	122,248
Tonghoo,	3900	66,773
Total,	32,454	1,094,885

Of this number of inhabitants, about 800,000 are true Burmans; but in addition to these, there is a sprinkling of Karens, who live in the wild and hilly districts, Taleins or Peguers, Shans, Khyengs, Yabaings, Indians, Chinese, and a few other races.*

The principal river of P. is the Irrawadi (q. v.). In March, the river begins to rise, and gradually increases in volume till its waters are forty feet above their lowest level. They rapidly subside in October, when the rains cease, and the north-east monsoon sets in. The revenue of P. for the year 1862—1863 was 5,653,316 rupees; though, under the rule of the king of Burmah, it did not amount to half that sum. P. was annexed to British India at the close of the Burman war of 1852, since which time slavery has ceased to exist, schools have been established, and various public works undertaken.

Rice and teak timber are the principal exports. A flotilla of steamers keep up the communication between Rangoon (q. v.), the principal port, and the chief stations on the Irrawadi, conveying troops, stores, passengers, and mails from place to place.—Winter's *Six Months in British Burmah* (Lond. 1858); Martin's *British India* (Lond. 1862).

PEHLEVI (Valour, Power; *Zabân Pehlevi* = Language of Heroes) is the name of an ancient West-Iranian (Median and Persian) idiom, in use

* Lieutenant-colonel A. P. Phayre, chief commissioner of British Burmah, in his report for 1863 (Rangoon, 1863) states the population of Pegu as follows:

Races.	
1. Europeans and their descendants,	2,409
2. Burmese, including Aracanese and Taleings,	924,091
3. Karens,	249,518
4. Shans and Toungthoes,	24,689
5. Chinese,	1,724
6. Khyengs,	18,879
7. Indians,	11,844
8. Mohammedans of Burmah,	2,089
9. All races not included above,	9,142
Total,	1,244,385

chiefly during the period of the Sassanides (235—640 A. D.), who, wishing fully to restore the ancient Persian empire, endeavoured also to reinstate the primitive national language, fallen into disuse as a court-language since the time of Alexander's conquest. Yet they did not fix upon the pure Persian as it was still spoken in the interior, but upon the dialect of the western provinces, largely mixed with Semitic words, to which Arian terminations were affixed. The grammatical structure of the P. presents almost the same poverty of inflections and terminations as the present Persian. Although, however, less rich than Zend (q. v.) in inflection and accentuation, it yet boasts of the same copiousness of words as that dialect, to which it in reality succeeded. It is written from right to left, and the letters are mostly joined. The remnants of P. extant consist of coins, inscriptions (found at Hagiabed, Persepolis, Kirmanshah, &c.), and a number of books, all relating to the religion of Zoroaster. The most important of these are the translation of the chief part of the Zend-Avesta (Yazna, Visparad, and Vendidad), and such original religious works as the Bundeheah, Shikandgumâni, Dinkart, Atash Barâm, &c. The P. of the books differs from that of the inscriptions and coins to such a degree—according to the larger or smaller preponderance of the Semitic element—as to have misled investigators (Westergaard and others) to assume that two utterly distinct languages, a purely Iranic and a Semitic one, had been used somewhat indiscriminately at the time. The non-Iranian element is called Huzvareh (Huzooreh) by the Parsee priests, who, taking advantage of the ambiguity of the P. alphabet, often substitute the corresponding Persian for the foreign words. The Iranian part of the P. differs little from the Persian of our own day, and, in fact, the P. changed first into Parsee, and subsequently into modern Persian, simply by getting rid first of its Chaldee, and then of those of its Iranian words which had become obsolete. The chief use of the P. dialect at present is the assistance it offers towards the elucidation of the Zend itself. For the history of its investigation since it was first made known in Europe, we refer to PERSIAN LANGUAGE AND LITERATURE.

PEI-HO', a river of China, which, rising on the confines of Tartary, traverses the northern part of the province of Chih-le (q. v.) or Pe-chih-le, and falls into the Gulf of Pe-chih-le, in about 38° 30' N. lat.

The attack on the escort of the British and French ambassadors, whilst ascending the Pei-ho to Peking (June 1859), led to the war with China of 1860. See CHINA.

PEINE FORTE ET DURE, the 'strong and hard pain;' a species of torture formerly applied by the law of England to those who, on being arraigned for felony, refused to plead, and stood mute, or who peremptorily challenged more than twenty jurors, which was considered a contumacy equivalent to standing mute. In the beginning of the 13th c., this penalty seems to have consisted merely in a severe imprisonment with low diet, persisted in till the contumacy was overcome. But by the reign of Henry IV., it had become the practice to load the offender with weights, and thus press him to death; and till nearly the middle of the 18th c., pressing to death was the regular and lawful mode of punishing persons who stood mute on their arraignment for felony. The motive which induced an accused party, in any case, to submit to this penalty rather than to plead, was probably to escape the attainder which would have resulted from a conviction for felony. During the 15th, 16th, 17th, and even the 18th c., various cases are recorded

of the infliction of the punishment in question, namely, a practice pretended which had no sanction but the law, of first trying the effect of tying the hands together with withered, that the man might inflict the sentence to death. Amongst instances of his inflicting of this *poena fidei et doli*, as the following: *Antonis Quirk*, in 1442, charged with high treason, in speaking contemptuously of Henry VI., was pressed to death. Anthony Arvercott, in 1596, was pressed to death (*Bartholomew's History of England*, vol. 3, p. 271). Walter Calverly, a lawyer, in Yorkshire, arrested at the York assizes in 1605, for murdering his two children and others, his wife was pressed to death in the middle of his feet, which played on his breast (Horn's *Journal*). Major Strangways suffered death in a similar way in Newgate in 1837, for refusing to tell what shared with the murder of his brother-in-law, Mr. Parnell. In 1790, a person of the name of Mallon was pressed in Newgate for a considerable time, till he was released on his submission, and he was released in the following year of our national history, when lay under a weight of 500 lbs. seven patients. As late as 1741, a person resorted to the press pressed to death at the Guildhall assizes, for being of his thumbs having been that third thumb cut off.

The statute 12 Geo. III. c. 24 virtually abolished the press *in toto*, by enacting that any person to their second entry when arrested on felony or their death be executed, and hence the same punishment and execution awarded against him as if he had been convicted by verdict or confession.

KEPION, LAKE, in the north-west of Russia, is bounded by the government of St. Petersburg, to the westward of Kholmna and Livonia. On the east side it is bounded with Lake Pskoff by a line 10 miles in length and from 14 to 21 miles broad. The length of Kepion lake is 57 miles, the greatest breadth about 40, and the depth from 14 to 20 fathoms. Lake Pskoff receives the waters of the river Volkhova, and Lake P. is supplied by Lake Pskoff and by the Vishnoff from the west, and other rivers. The waters of the lower lake are carried to the Gulf of Finland by the Narova. The lakes are bordered with several picturesque islands, and surrounded with banks which are for the most part sandy and almost in fish, the taking of which has employed to many.

PERIKRATOR (Gk. *Perikratōr*, a famous name of Athens, belonged to a family of Attica, then almost divorced from Pylus Nestor, and was the father of the hero of the 7th c. B.C.—certainly at least three B.C. His father's name was Hippocleides, and through his mother he was pretty well related to the great lawyer Solon, between them and P. a very intimate friendship long lasted. He received an excellent education, and became of his nature, as well as the generosity of his part was as great that according to Solon, if he had been an Athenian, he would have been the best of Athenians; but his passion for the exercise of power led him to adopt a policy of terror and dissimulation for the purpose of raising his ends, which provokes us from regarding him with the admiration that the beneficent character of his government ought soon to demand. When P. cooperated with his kinsman Solon, and in two wars against the Megarians, secured considerable military distinction; but afterwards, when probably his ambitious views had become more extended, he came forward as the leader of one of the three parties into which Attica was then divided. These were, the *Peisistratid* party of the Peisistratids, the *Phyleid* party of the Phyleids, or the *Phyleid* party of the Phyleids, and the *Phyleid* party of the Phyleids, or the *Phyleid* party of the Phyleids.

(party of the Peisistratids), or wealthy merchant class; and the *Phyleid* party of the Phyleids, chiefly a labouring population, jealous of the rich, and eager for equality of political privileges. It was to the last of these that P. attached himself; but instead he astutiously cultivated the good-will of all the power classes, to whom he showed himself a most liberal benefactor. At last P. took a decided step. Driving into the market place of Athens one day and exhibiting certain self-inflicted wounds, he called upon the people to protect him against his and their enemies, alleging that he had been attacked on account of his patriotism. Solon, who was present, accused him of hypocrisy; but the crowd were, according to Ptolemy, ready to take up arms for their benefactor; and a general assembly of the citizens being convened, Arcton, one of P.'s partisans, proposed to allow him a body-guard of 500 men. The measure was carried in spite of the strenuous opposition of Solon. Immediately P. increased the number, and in 593 B.C., when he felt himself strong enough, seized the Acropolis. The citizens, in general, seem to have tacitly sanctioned this high-handed act. They were sick of the anarchic broils of the different factions, and probably glad to see their oligarchic and tyrannical usurper assume authority. Arcton and the Alcibiades—the leader of the rich aristocratic party—immediately fled from the city. Solon, who loved neither oligarchic arrogance nor military despotism, but was a thorough constitutionalist, tried but in vain, to rouse the Athenians against Perikrator. P., who was not at all vindictive in his disposition, did not attempt to molest Solon; he even mentioned the legislation of the latter almost intact, and distinguished himself chiefly by the vigour of his administration. P. himself did not enjoy his first 'tyranny' long. Timotheus and the Phyleid called under Lykurgos and Megakles, united their forces, and overthrew the usurper, who was forced to go into exile. But the coalition of the two factions was soon broken up. Megakles hereupon made overtures to P., inviting him to resume his tyranny, which he did, but a family quarrel with Megakles induced the latter to again ally himself with Lykurgos, and P. was driven from Athens. He retired to Eretria, where he remained for ten years, ever keeping an eye, however, on Athens, and making preparations for a forcible return. How he managed to acquire so much influence while only a banished man, is difficult to ascertain; but certain it is that many Greek cities, particularly Thbes and Argos, placed the greatest confidence in him, and finally supplied him abundantly with money and troops. P. at length sailed from Eretria, landed in Attica at Marathon, and marched on the capital. His partisans hurried to swell his ranks. At Pallene, he encountered his opponents, and completely defeated them, but used his victory with admirable moderation. When he entered the city, no further resistance was made, and he remained the sovereign at once. The date of this event, as of most others in the life of P., is very uncertain; perhaps we shall not err far if we place it about 543 B.C. He lived for sixteen years afterwards in undisturbed possession of power, dying 527 B.C., and transmitting his supremacy to his sons, Hippas and Hiparchus, known as the *Phyleid* party. His rule was mild and beneficent. Although the precautionary measures that he adopted to establish his authority involved at first a certain restraint and sternness of policy (e.g., the seizure of the children of his leading opponents, and the detaining them as hostages); yet as soon as he placed himself out of danger, there he began to display that wonderful tact,

moderation, kindness, and sympathetic appreciation of the wishes of the Athenians, that have won him the praise and esteem of all later ages, in spite of his usurpation. He firmly, but not harshly, enforced obedience to the laws of Solon; emptied the city of its poorest citizens, and made them agriculturists, supplying such as had no resources with cattle and seed; secured provision for old and disabled soldiers; bestowed great care on the celebration of the religious festivals of the Atticans, and even introduced some important changes; encouraged literature more than any Athenian had ever done before—it is to P., or to the poets, scholars, and priests about him, that we owe, for example, the first complete edition of Homer (q. v.); and, like his still more brilliant successor in the following century, Perikles, he adorned Athens with many beautiful buildings, such as the Lyceum, a temple to the Pythian Apollo, another to Olympian Zeus, &c.

PEKAN, or **WOOD-SHOCK** (*Martes Canadensis*), a species of Marten (q. v.), very nearly allied to the sable, a native of the northern parts of North America. It is twice the size of the pine marten, and is generally of a grayish brown colour; the legs, tail, and back of the neck marked with darker brown. The fur, although not so valuable as sable, nor even as that of the pine marten, is useful, and large quantities are sent to the market. The P. lives in burrows, which it excavates in the banks of rivers; and feeds chiefly on fish and other aquatic animals.

PEK'IN, or **PE-K'ING** (i. e., Northern Capital), the capital of the Chinese empire since 1408 A. D., is situated in lat. 39° 54' 13" N., and long. 116° 28' 54" E., in the northern province of Chih-le, at a distance of nearly 100 miles from the sea, and about 60 miles from the great Chinese Wall. The population of the city is estimated at about 2,000,000; the entire area, in which is included much vacant space, at 27 square miles, and the circuit of the walls is said to be about 25 miles. These walls are made of earth, with an outer casing of brick, having embrasures for musketry or ordnance every 50 feet; their height is about 40 feet; thickness at the base about 30 feet, and at the top 12 feet, which is paved with stone, and where horsemen can ascend by a ramp or sloping way. At intervals of 60 yards are square towers, projecting outwards from the walls 50 or 60 feet. The gates which give access to the city from the surrounding country are 16 in number, nine of which belong to the Northern or Tartar City, and seven to the Southern or Chinese City. Over each gate is a watch-tower nine stories in height, and loopholed for cannon.

The city of P. is divided into two parts, separated by a wall with three gates. These two sections form respectively the Northern, Interior, or Tartar City, called *Nei-tching*; and the Southern, Exterior, or Chinese City, called *Wai-tching*.*

1. *Nei-tching*, or the *Northern City*, has three distinct divisions or enclosures—viz., the Prohibited City, the Hwang-Ching, or Imperial City, and the General City. The first of these—the innermost or

central block—is surrounded by a yellow wall about two miles in circumference, which shuts in the palaces, pleasure-grounds, and temples of the sacred city. Here live the emperor and his family, the ladies of the court, and the attendant eunuchs. 'Keen-taing-Kung,' or 'the Tranquil Palace of Heaven,' the emperor's private palace, is the most magnificent of the royal residences. Other notable buildings of the prohibited city are 'Fung-seen-teen,' the Temple of Imperial Ancestors; Ching-hwang-meon, the Temple of the Guardian Deity of the city; Nan-heun-teen, the Hall of Portraits of the Chinese emperors and sages; and Wan-yuen K'o, the Imperial Library. The Imperial City is built around this central block, and contains the palaces of the princes, temples, some of the government offices, and spacious pleasure-grounds. From Wai-yung-teen, the Imperial Printing-office, the *Imperial* or *Pe-king Gazette* is issued daily for all government officials throughout the empire. This is the only publication in China approaching to a newspaper, and is named *King Paow*, or 'Great Report.' It is not merely a report for official information, but forms the basis of the national annals, and is compiled from the daily records of the Supreme Council. Besides the daily edition, there is one published every two days, which is sold to the public, and from which is withdrawn decrees and reports of a secret character. The journal itself is a miserable production even in China, and consists of from 15 to 20 pages, not so large as common note-paper. The General City—the third division or enclosure—lies between the Imperial City and the outside walls; it is more densely populated than either of the preceding divisions, and contains the most important of the public offices, including the six supreme tribunals or boards; the Le-fan-yuen, or the Office of Foreign Affairs; Too-cha-yuen, or the Imperial Censorate; Han-lin-yuen, or the Grand National College; the Great Medical College; the Observatory; the Police-office; and the British, French, and Austrian legations, which are close to the south wall. The British minister resides in the Leang-kung-fu, or the Palace of Leang, a gorgeous building, consisting of four or five large halls, and covering many acres of land. The principal streets of the general city—from 140 to 200 feet wide and unpaved—are continuous lines of shops painted red, blue, and green, decorated with staring signs and resplendent with Chinese characters highly gilt. By day and by night, by the light of the sun, or by the illumination of torches and paper lanterns, the roar of these great thoroughfares is incessant; shopkeepers, pedlars, mountebanks, quack-doctors, passengers on foot or on horseback, each and all contributing to the general hubbub. The minor streets and lanes, where the houses of the populace are mingled with public offices, temples, stores, and manufactories, are by no means pleasant places, their general character being an 'insupportable odour,' and one-sided brick houses with roofs of a gray colour. There is 'Fetid Hide Street,' 'Dog's-tooth Street,' 'Dog's-tooth Street,' 'Barbarian Street,' and many others with names equally uninviting.

2. *Wai-tching*, or the *Southern City*, is the second great division of Pekin. It measures about four miles from east to west, and two miles or less, from north to south; but a great portion of the enclosed space is laid out in parks and gardens. Teen-Tan, or the Temple to Heaven, and Tec-Tan, or the Temple to Earth, with their grounds, occupy a considerable space; the theatres and places of public amusement are likewise situated in the Southern or Chinese City. Robert Fortune, who has lately visited P., describes its most peculiar

* Northern City and Southern City are the most correct terms. The latter was added to the more ancient Northern City, and was originally designed to encircle it; hence it was called the Exterior City, in contradistinction to the Northern or Interior City. It was also intended to reserve the Northern City for the Tartars, and the Southern City for the Chinese, as the names still imply; but in point of fact, the Tartar City contains as many Chinese as Tartars; and it is not surrounded by the so-called Chinese City, which latter has only been added on the south side.

had striking features as follows:—As an eastern city, it is remarkable for its great size, and for its high massive walls, ramparts, and watch-towers, its straight and wide streets are different from those of any other Chinese town which has come under my observation. Its imperial palace, summer-house, and temples, with their quaint roofs and white tiles, are very striking objects; and the masses of private dwellings situated amongst trees and gardens, surrounded with high walls, give a castle-like appearance to the great city. The trees and gardens of the palace, with Kung-tai or Peacock Hill, are objects of considerable interest, as is also Tsung Menan, suggesting as it does some resemblance to Times long gone by, with Tibet or India.

Outside the city, there are walled suburbs as almost every walled town in China. These are of considerable extent, but straggling, and consist essentially of an agricultural population, the food being everywhere in a state of cultivation, producing mainly maize and millet, as it is not so suitable for the staple products of rice and wheat. The food is fully covered, but well finished, which gives a green aspect to the landscape; and when viewed from the range of mountains extending from the west of P. to the north-west, presents a picturesque appearance. It is in the former direction, towards the north, that the famous Pao-ming-pai palace was situated, which were sacked and destroyed by the rebels in October 1860. These were 30 in number, surrounded by every variety of hill and dale, meadows and ferns interspersed with canals, pools, streams, and lakes, with numerous temples and pavilions containing statues of men and gods in gold, silver, and bronze. Here had been heaped up for centuries all the movable riches and products of the commerce of China, amongst which were found much booty by the English missionaries. At the approach of the allies, Hien-fang had in haste; and when Lord Elgin learned that it was in those suburbs that the British and French embassies, captured by treachery, had been tortured he gave the order to sack and destroy this favourite residence of the emperor's, 'as it could not fail to be a blow to his pride as well as his feelings; and it became a solemn act of retribution.' Two palaces were chosen at every valuable, and their walls shattered by fire and sword; while the fugitive emperor died at his stronghold, Rehol, among the Tien-tsin Alps.

P. has thus been rendered memorable by this march of the British and French forces (1860) to the walls of the city, on which the British and French flags were raised. The provisions of the Treaty of Tientsin (1858), now China's were solemnly ratified and implemented by the Convention of P., which was signed in the English and French languages at P., October 24, 1860. The following is a extract of this important document. By Article 4, it is agreed that on the day on which the convention is signed, the port of Tien-tsin shall be opened to trade, and British subjects shall reside and trade there under the same regulations as at any other port of China by treaty open to trade. Article 5 confers full liberty on the Chinese to emigrate, together with their families, to British colonies or other foreign parts. Article 6 refers to Her Majesty the Queen of Great Britain and Ireland, and to her heirs, the Princess of Wales, to the province of Kwang-tung, as a dependency of Her Britannic Majesty's colony of Hong-kong, with a view to the maintenance of law and order in and about the harbour of Hong-kong. But the most important article of the Convention is that which allows the residence

of a British envoy at P., a privilege which was also accorded to Russia. About four years have elapsed since then, and the greatest benefits have resulted to both governments by this step. The same has been granted to the French and American governments; who, with the several missionary establishments, now (1864) form a population of 41 foreign residents, besides a few ladies, children, and servants; while foreigners of all nations are allowed to visit, but not to trade within the precincts of the city. — *New York and China*, by Robert Fortune (London, 1853); *Chinese Republic* (March 1854); *Illustration's Magazine* (January 1861); *Lord Ripa's Dispatch* (October 1860); *M. News* (1863).

PELAGIANISM, the doctrinal system of Pelagius (q.v.) especially on the subjects of the natural condition of man, original sin, grace, free-will, and redemption. Under the head PELAGIANISM will be found what may be called the external history of the controversy to which the opinions of that remarkable man gave occasion. The movement, considered in itself, is one of the most interesting in the history of the human mind. At the close of the great controversies on the Trinity and Incarnation, the speculation, which for nearly a century had worned itself in vain endeavours to make plain the inscrutable mysteries of the divine nature, at length turned towards upon itself; and no one at all familiar with the controversy on P. can doubt that that profound view of the capabilities of human nature, which lies at the root of all the theories of which P. was but the exponent, was a reaction against the crude and degrading conceptions of the nature and origin of the soul which characterized the philosophy, not alone of the Manichaean teachers, but of all the dualistic religions which sprung from the prolific soil of Gnosticism. To the Manichaean, and to all in general who adopted the Gnostic views as to the evil origin and nature of matter and material substances, man was, in his psychical nature, evil and incapable of good. The Christian teacher, in combating this view, easily passed into an opposite extreme, and overlooking or explaining away the strong language of the Scripture, was led to represent man as endowed with full capacity for all good; and as long as the only alternatives to be controverted were those who urged the views of the Gnostic school, the line taken by Christian writers was but little qualified by any of those limitations and reserves which have arisen in later controversy; and thus the earlier Fathers, especially those of the Eastern Church, where Gnosticism was chiefly to be combated, are found to press earnestly the power for good which man possesses without entering closely into the origin or the motive principle of that power. But whatever of vagueness hung over this important subject was dispelled by the bold and precise statements of Pelagius, or at least by the discussion which at once arose thereupon, throughout the entire church. His teaching on the subject of original sin and on the primitive state of man, has been already detailed. See ORIGINAR SIN. The earliest formal embodiment of these doctrines, for the purpose of obtaining upon them the public judgment of the church, was in a number of articles presented to the council of Jerusalem, in 445, by Orosius. See PELAGIUS. Of these, the first five regarded the doctrine already noticed under ORIGINAR SIN. The latter portion of the articles alleged that no grace or aid from God was needed for particular actions, but that free-will and the teaching of the law sufficed; that God's grace is given in proportion to our merits; that free-will would not be free, if it stood in need of aid from God; that the pardon of penitents is not granted according to God's grace and mercy, but according to their own merit and labour;

and that our victory does not come from God's assistance, but from our free-will. Although the final sentence condemnatory of these doctrines (see PELAGIUS) was very generally accepted, yet the recusant party was not wanting in energy and ability. The great champions on each side were Augustine for the orthodox, and Julianus, Bishop of Eclanum, for the Pelagians. Of so much of the controversy as regards original sin, the history has been already related; that on grace and free-will was more subtle, and has led to more numerous divisions on the side of orthodoxy as well as of dissent. In order to evade the condemnation of the doctrine originally ascribed to them as to grace, Pelagius and his followers declared that they did not deny the necessity of grace; but by this name they did not understand any real and internal supernatural aid given by God in each particular action, but only either some general external assistance, such as preaching, the Scriptures, good example, &c., or an aid given which might facilitate and secure the particular work, but which was by no means necessary for its accomplishment. Whether, indeed, they at any time admitted any real internal grace, is a question much disputed. Grace is of two kinds—that which moves the will, and that which enlightens the understanding. It is necessary, too, to distinguish two periods in the history of P.—one before the appearance of the *Epistola Tractoria* of Pope Zosimus; the other, subsequent to that decree. In the first period, it would seem that the Pelagians did not admit the necessity of any internal grace whatever; in the latter, they admitted the necessity of a grace of the intellect, but not of the will; or if they seemed to speak of any internal grace of the will, it was only as facilitating man's act, not as at all necessary to his doing it. The Pelagian theory, in a word, was, that man, as coming from his Creator's hand, possessed in himself, and as constituents of his own nature, all the powers which are necessary for the attainment of salvation; that by the faithful employment of these natural powers, without any further aid whatever from God, he merits eternal life, and all other rewards, by a strict title of justice; and that, to suppose grace to be necessary, is in truth to destroy the essence of free-will. This doctrine was somewhat modified in the Semi-Pelagian System (q. v.). The Catholic schools, all without exception, maintain the necessity of grace for the performance, not only of all meritorious, but of all supernatural good works; and they are equally unanimous in maintaining that the grace so given, even that which is called 'efficacious,' does not destroy the freedom of the will. They distinguish between the 'natural' and the 'supernatural' order, and between the powers and gifts which are proper to the one and to the other. For the attainment of all the ends of the natural order, man possesses, by his very constitution, all the powers and all the gifts which are necessary; and by the proper use of these powers, he is able to merit all the rewards which belong to the natural order. He is able, therefore, without any supernatural grace, to perform morally good works (as acts of natural benevolence, the fulfilment of the ordinary duties to his neighbour, &c.), and to fulfil the purely natural obligations. But in order to works in the supernatural order (such as the love of God above all things for His own sake, faith in Him as the author of all good, &c.), and the rewards which are promised for such works, the will of man must be moved and strengthened by supernatural grace, with which the will freely co-operates, but which is a purely gratuitous gift of God—so purely gratuitous, that although God has promised eternal life as the reward of man's co-operation, yet the merit arises

entirely from God's gift and promise, and not from the natural powers of the human will.

Without going into the details of the teaching of the Catholic schools, it will be enough to particularise the most remarkable among them. Of these, the chief are the Molinist, which, giving most to liberty, lies nearest to the border of P., but is clearly distinguished from it by maintaining the necessity of grace for every supernatural act; and the Thomist and Augustinian, which give most to grace, but at the same time expressly preserve the freedom of man's will. The Thomists are often represented as denying the freedom of man's actions under grace, but although it is difficult to explain, in popular language, their method of reconciling both, yet to those acquainted with the scholastic terminology, their distinction between the infallible efficacy of grace, and its imposing necessity on the will is perfectly appreciable. In this they, as well as the Augustinian school, differ from the Jansenists (q. v.). The Jansenists, indeed, regard the Molinist school as a plain revival of P., and they profess that they alone represent fully, in their own system, the very same position which St Augustine formerly maintained against that heresy in its first origin.

In the Reformed Church, the Arminian doctrine may be said to correspond in the main with the Molinist system in the Roman Church. The Gomarists, in most, although not in all particulars, fall in with the Jansenistic views. The Pelagian views are distinctly represented in modern controversy by the Socinians and Rationalists; and indeed very many of those who, outside of the Roman Church, have at various times engaged in the predestinarian controversy on the side of free-will, have leaned towards, if they have not fully adopted, the Pelagian view. In this controversy, however, the practice, which is not uncommon in polemics, of imputing to an antagonist the extremest views of the particular side to which he leans, has been specially noticeable. The Jesuits have been stigmatised, even by their Catholic antagonists, as Pelagians; the Thomists are called by the Jesuits indiscriminately Jansenists and Calvinists; while both unite in representing Calvin and his school as in substance Manichean.

Hardly one among the many Christian controversies has called forth a greater amount of subtlety and power, and not one has so long and so persistently maintained its vitality. Within the twenty-five years which followed its first appearance, upwards of thirty councils (one of them, the General Council of Ephesus) were held for the purpose of this discussion. It lay at the bottom of all the intellectual activity of the conflicts in the mediæval philosophic schools; and there is hardly a single subject which has come into discussion under so many different forms in modern controversy. See JANSEN, ARMINIUS, GRACE, PREDESTINATION, REPROBATION, ORIGINAL SIN, TRADUCIANISM.

PELAGIUS, a celebrated heresiarch of the 5th c., author or systematiser of the doctrine known as PELAGIANISM (q. v.). Of his early life, little is known. He was probably born about or before the middle of the 4th c., in Britain, or according to some, in Bretagne, his name being supposed to be a Greek rendering (*Pelagios*, of or belonging to the sea) of the Celtic appellation *Morgan*, or sea-born. He was a monk, but the time and place of his entering that state are unknown; it is certain, however, that he never entered into holy orders. He settled in Rome, and at the end of the 4th c. he had already acquired a considerable reputation for sanctity and for knowledge of the Holy Scriptures and the spiritual life. P. does not appear to have himself been a very active propagandist; but he had

attached to his "closed & follower of great energy, and a bold and robust temper, natural tolerating who is generally supposed to have been a Gent, which, in the vocabulary of that age, means a native of Ireland. At Rome, however, they admitted that little notice, although they began to make their doctrine public about 405, and in 410, after the sack of the city by the Goths, they withdrew to Africa. After some time P. made a pilgrimage to Jerusalem, where he met St Jerome, and for a time enjoyed the regard and confidence of that saint but had tempered scholar. His opinions, however, becoming known, Jerome withdrew from their association. Celsus having assumed as *Chelone*, and sought to be admitted to communion, his disciples became the subject of discussion, and in a synod several opinions assumed a firm position. He appeared in Rome, but never Carthage without presenting the appeal, he passed to Ephesus, and the proceedings taken in Carthage regarding him are chiefly important as having first introduced St Augustine into the controversy. Meanwhile P. remained at Jerusalem, and one of the proceedings at Carthage having been carried to Palestine, P. in 415 was accused at home before the synod at Jerusalem, by a Spanish priest *Donatus*. The impeachment failed, probably from the fact that *Donatus* was unable to speak Greek, the language of the synod; and in a synod subsequently held at Diospolis in the same year, P. gained condemnation by accepting the doctrine of the synod of Carthage already referred to, and even obtained from the synod an acknowledgment of his conformity. The West, however, was more deeply imbued by his teachings. A synod of Carthage, in 418, condemned P. and Celsus, and wrote to Pope Innocent I., requesting his approval of the sentence, with which request Innocent complied by a letter which is still extant. On the death of Innocent, Celsus came to Rome in person, and P. at the same time addressed a letter to Zosimus, the successor of Innocent; and in a council which Zosimus held, Celsus gave such explanations that the pope was led to believe that the doctrines of P. had been misunderstood, and wrote to call the African bishops to Rome. A council of 214 bishops, however, was held in Carthage, in which the doctrine of P. was formally condemned in nine canons, which were sent to Rome with full explanations; but on receipt of these doctines, Zosimus reopened the cause, cited and condemned Celsus and P., and published a decree, called *Epistola Trinitaria*, asserting the anarchy of the African council, and declaring that all bishops should subscribe them, under pain of deposition. Nineteen Italian bishops refused to accept these canons, and were deposed. Thus broke, and the person who may be regarded as the greatest theological opponent of P. in the ancient controversy, was the celebrated Julius, bishop of Eclanum, near Benevento, who is well known to every reader of the great saint. St Augustine. P. himself was banished from Rome, in 418, by the Emperor Honorius. From this date P. disappears. Of his after life, nothing is known in detail. *Donatus* gives an unfavorable account of his later career, but in a period of such excitement, we may not accept readily the judgment of an adversary. The controversy, considered as an exercise of intellectual energy, is the most remarkable in the ancient history of the church. But the most important of the writings on the Pelagian side have been lost. Julius is chiefly known through the replies of Augustine. The *Enchiridion* of a *Commentary* on St Paul's Epistle to the Romans, and his *Memorial* & *Pope Innocent*, have escaped destruction probably

from their being included by collectors in the works of St Jerome. They are much mutilated, but yet almost certainly genuine. All his other works have been lost, except some further portions, chiefly fragments, which (with the above) have been published under the title of *Agostino Augustinus*. After his banishment, P. is supposed to have returned to his native country, and to have died there. Others, however, represent him as having died in Palestine. Of his doctrine in detail, an account will be found under *PELAGIANISM*.

PELAGONIC ACID ($\text{HO}(\text{C}_2\text{H}_3\text{O})_2$) is one of the volatile fatty acids in the general formula $\text{C}_n\text{H}_{2n}\text{O}_2$. It is an oily fluid, nearly insoluble in water, but soluble in alcohol and ether. It derives its name from its having been originally obtained from the leaves of *Pelargonium roseum* (see next article), by distilling them with water. It may also be obtained by the oxidation of oleic acid or of oil of rose by nitric acid. The pelargonate of oxide of ethyl, $\text{C}_2\text{H}_5\text{O}(\text{C}_2\text{H}_3\text{O})_2$, is an oily fluid of a very peculiar smell. According to Frankland, it is to this compound that old whisky owes its peculiar flavour, and its addition to new whisky, with a view of giving it an old flavour, is not uncommon.

PELAGONICUM, a genus of plants of the natural order *Geraniaceae*, including many of the most favourite greenhouse flowers, to which the old generic name, *Geranium*, is often improperly given. The characters which distinguish P. from geraniums, as now constituted by botanists, are given in the article *GERANIUM*. The species are numerous, and mostly South African; Australia also producing a few. Some of them are herbaceous, and some are shrubby; most of them are half-shrubby. Some have tuberous rootstocks. The leaves exhibit great variety in form, division, &c. The flowers always adhere to a certain type in form, but with great variety in size, colour, &c. They are always in stalked umbels, which arise from the axils of the leaves, or in the stemless kinds from the midst of the leaves. In no genus has the art of the gardener produced more striking results than in this; and the number of beautiful hybrids and varieties is very great, some of them rivaling in beauty any of the original species. Some specimens, not possessing much beauty of flower, are cultivated for the grateful odour of their leaves, which in some resembles that of roses; in others, that of apples, lemons, &c.; whilst that of many species is rather unpleasant. The cultivation of pelargoniums is similar to that of other *Geraniaceae*. See *GERANIUM*. A few of the species endure the open air in the south of England; many are planted out in summer even in Scotland. Water must be liberally supplied by pelargoniums during the time of flowering; but no plants more strongly require a period of rest, and water must then be very sparingly given. Many of the shrubby kinds may be taken out of the soil, lying up by the roots in a dry dark cellar, or covered with hay, and put aside in a box, in a cool dry loft or garret, care being taken, however, to protect them from frost. Every leaf should be removed before they are taken up, and young watery shoots should be cut off. Another method of treating them is to cut off every leaf before frost comes, and to keep the plants all winter in their pots in a dry cool room, without giving them a drop of water. By such means, many of this beautiful genus are successfully cultivated by persons who have no greenhouse.

PELAGIANS, variously explained as denoting either "Dwelling Asiatics" (*Pelagians*) or "Boats" (*Pelagians*)—signification of wandering halots; or as being derived from the biblical *Pelag* (Gen. x. 20).

from the Greek *Pelagos* (the Sea), *pelazo* (to approach), or *pelein* and *agros* (to till the field), &c.—‘a name, in fact,’ as Niebuhr says, ‘odious to the historian, who hates the spurious philology out of which the pretences to knowledge on the subject of such extinct people arise’—designates a certain tribe or number of tribes who inhabited Italy, Thracia, Macedonia, a part of Asia Minor, and many other regions of Southern Europe, in prehistoric times. Ethnologically, they belong to the same race as the great stock of the earliest known settlers, that reached from the Po and the Arno to the Rhyn-dakus (near Kyzikus). Yet no Pelasgian town or village existing in Greece Proper after 776 B.C., speculation has, ever since the commencement of European historiography, been busy trying to supply the facts that were wanting to ascertain the exact origin and history of these predecessors of the Hellenes and Romans; and so futile have all efforts in this direction remained, that the very term Pelasgi has, from the days of Homer to our own, been used almost arbitrarily to designate either a single obscure division of a tribe like the Leleges and the Dolopes, or as an equivalent for all the Greeks of a very early period. In this latter sense, they are spoken of by Æschylus, Herodotus, Homer; while they are considered one of the branches of the race or races that peopled Greece, by Thucydides, Strabo, and most modern writers, the word thus not being a comprehensive term, like Arian, but a narrowly circumscribed one, like Hindu. Recent investigation seems, as regards their previous history, to lead to the result, that soon after the first immigration of Turanians, they, like other tribes, left their Asiatic homes, and proceeded towards Europe. They are found at a very early period settled in Asia Minor; and Homer speaks of them as allies of the Trojans. They then seem to have spread themselves, by way of the Propontis and Ægean, and again by Crete, over many of the islands between the two continents; and finally, came to occupy a great part of the Hellenic mainland—Thessaly, Epirus, the Peloponnese, Attica, Macedonia, Arcadia, provinces which, one and all, up to the latest period, bore distinct traces of the once undisputed sway of the Pelasgians. According to Herodotus, the Hellenes themselves sprang from them; and there can hardly be a doubt that they formed a most important element in the formation as well of that most gifted of nationalities, as of the Latin people. The early Etruscans (q. v.) were P. to a certain extent; and the southern tribes of the Peucetians, Enotrians, and Iapygians are distinctly declared by ancient writers to belong to their race. The step from Greece into Italy is natural enough. What caused their wanderings originally, is difficult to conjecture; but it may not unreasonably be assumed, that they were caused to a certain extent by immigrations of eastern tribes, such as the Lydians, Phrygians, Carians, who pushed them further and further west, as they took possession of their old homes. A special stock was formed by the Tyrrhenian Pelasgi, whose gradual advance in Greece may be traced from Acarnania to Boeotia, thence to Attica, and later still, to the Hellespont, Lemnos, &c. A strong protest, however, must be recorded here on the part of some modern writers against the assumption of others, that the P. were in reality the original population of all Italy, as they were of the greatest part of Greece (Pelasgia). It is absurd, they argue, to suppose that a rich and populous nation, which had held a country like Italy for many centuries, should suddenly, just at the approach of historical times, die out without leaving even such single remnants as the Pelasgic settlements in Greece mentioned by Herodotus. These aboriginal Italian P. are, according to them, neither

more nor less than a mere hypothesis of ignorant ancient writers, who wished to explain the ethnological and philological affinity between the two classical nations in an easy manner, and who, anticipating the questions about a contemporary colony, kill the whole nation off by pestilence and famine.

The Pelasgians, from what we can glean about them, would appear to have been a highly intellectual, receptive, active, and stirring people, of simple habits withal, chiefly intent upon agricultural pursuits. Several improvements in this province were distinctly traced back to them, such as the ploughing with oxen—for which purpose they had to invent the special goad; further, the art of surveying, and the like. Yet they were no less warlike when attacked and driven to self-defence; and the trumpet, which calls the widely scattered troops to the attack, was supposed to have been first used by them. That the art of navigation was well known to them, is shewn sufficiently by their incessant migrations over sea and land. Of their architecture, in that style which, in default of a better name, has been called Cyclopean (q. v.), remnants are still existing. The names Larissa, Argos, Ephrya, frequently met in ancient Greece, were bestowed by them upon their fortified cities, and are only generic names, expressive of either mountain fortresses or strongholds in plains. Wishing to remain in peace, they endeavoured to keep off the invader by walls so enormously strong, that it really seems most surprising how they ever could have been taken. Besides these, they built canals, dams, and subterranean water-works of astounding strength and most skillful construction. The accompanying woodcut represents the

Fig. 1.—Section of Tomb of Atreus at Mycenæ.

tomb or treasury of Atreus at Mycenæ, vaulted with a fine pointed ‘horizontal arch,’ 48½ feet in diameter. Of their sculpture, which they no doubt likewise cultivated to a certain degree, we have but very small relics, such as a head of Medusa, and a

Fig. 2.—Plan of Tomb of Atreus at Mycenæ.

Xoanon (Divine Image) of Orpheus; besides these, certain traces of their special mystic worship are to be found in archaic representations,

which, though not hitherto ascribed to them, bear their direct influence upon their very form. How far they were either the inventors of the so-called Cretan or Phœnician writing-characters, from which all European characters are derived, or merely their 'improvers,' is not to be decided by the contradictory evidence to be found on the subject; but this, at all events, is certain, that they were acquainted with the art of writing, and had thus a rank element of culture in their possession before the dawn of history. Regarding their religion and worship, there is this only to be held with certainty, that it originally consisted in a mystic series of three natural powers, whose influence is chiefly visible in the growth of the souls of the earth. From Egypt they obtained names for their till then nameless gods, generally called by them the Thes; and they proceeded, by permission of the Arabian gods, which, together with the Pythian, they then founded—a fusion from upon them individually. Their duties were, besides the Phœnician Eshim, Ismetem, Theophorus King, Omonos, Heros, Sons of Ischak, Ischak, Herosmetem, Theos, Pag, &c. Whether these 12 gods inhabited Ischia and Ischia, and who were conquered by Darius, offered no human sacrifice or not, is doubtful. An ambiguous term of Herodotus respecting the language of those small Cretan remnants who had survived to his day, has given rise to endless and most contradictory discussions. He speaks (I. 57) of their 'barbarous language,' and the question is, whether he meant that it completely differed from Greek, or that there was only so vast a divergence of dialect, that it had become unintelligible to his contemporaries. His incline to the former opinion; Niebuhr, Thirlwall, T. O. Müller, followed by H. Rawlinson and others, held, with more apparent show of reason, that the term 'barbarous language' merely indicates a corruption or alteration of idiom, such as a long lapse of time would infallibly produce, and that it bore the same relation to the Greek of the day as the Gothic does to the German, or the Latin to any of the Romance languages, not to suppose the former period of out-of-the-way place in Switzerland and elsewhere, supposed to be inhabited by civilized descendants from Roman legions. That other phenomenon of the vast number of roots common both to Greek and Latin—the latter, it must be remembered, having been proved to be derived, not from the former, but from the Osco—would thus easily be explained by the assumption of a common Pelægian linguistic (as well as ethnical) stock in both nationalities.

Their political circumstances are as unknown to us as the whole process of transition between them and the real Greek period. From a few scattered allusions, we may conclude, that they were not uniformly governed; that some of their multifarious tribes were ruled by priests, while others stood under the patriarchal rule of the head of the clan or family.

How they gradually disappeared from the rank of nations, by being either 'absorbed' by superior races (Hellenes, Israel, Carians, Lydians, Phrygians), or amalgamated to nameless semi-populations, does not seem so difficult to understand as some writers would have us. Hundreds of nations have disappeared in the same manner, and we may even watch the process with our own eyes. Interesting as it might be to dwell more minutely on some of the many divergent theories and speculations upon the P. as the parent of historians, philologists, ethnologists, antiquaries, and agriculturists generally, to whom, at all times, this people proved exceedingly attractive, we cannot enter any further upon them

here, but we shall conclude with Orosius's dictum: 'If any man is inclined to call the unknown pre-Hellenic period of Greece by the name of Pelægia, it is open to him to do so. But that it is a name carrying with it no assumed predilection, merely enlarging our insight into real history, and enabling us to explain what would be the real historical problem—how, or from whom, the Hellenes acquired that stock of indispensable aptitudes, arts, &c., with which they began their career.'

PELAYO, said by historians to have been the first Christian king in Spain, after the conquest of that country by the Arabs. Contemporaneous historians make no mention of him, but this may be accounted for on the ground of the insignificant size of his kingdom, which comprised only the mountainous district of Asturias. He is said to have been a son of the royal Visigothic line, and to have retired before the conquering Arabs to the mountains of Asturias, where he maintained himself against the armies which were sent to attack him, defeating them in various pitched battles, and in numberless minor engagements. One of his most famous exploits was the destruction of a large army sent against him by Tarik, near Cangas-de-Onís. His men were posted on the heights bounding the valley through which the Arabs were to pass, and, waiting till the enemy had become involved in the defile, at a given signal, overwhelmed them with enormous masses of rock. This great success caused P. to be recognized as sovereign by the surrounding districts, and the Christians looked to him from all parts of Spain. He was much engaged in contests with the Arabs, but nevertheless found time to reanimate agriculture, superintend the reconstruction of churches, and the establishment of a civil administration. He died in 737. Such is the account given us by later historians, who trace from him the genealogy of the royal family of Spain.

PELECA'NIDE, a family of palmiped birds, the *Fuligulæ* of Cuvier; characterised by a long, straight, compressed bill, hooked at the base, often with a pouch beneath the lower mandible; long wings, of which the last quill is the longest; short strong legs, and all the toes—including the hind toe—united by a membrane. They are generally excellent swimmers, expert divers, and birds of powerful flight. Some of them often perch on trees, which few other web-footed birds do. To this family belong pelicans, cormorants, frigate-birds, tropic-birds, and darters.

PELEW ISLANDS, a group of islands in the North Pacific Ocean, 450 miles east of the Philippines, in lat 7°–8° 30' N., long. 134°–136° E., at the western extremity of the Caroline Archipelago. The group includes about 20 islands, which form a chain running about 120 miles from south-south-west to north-north-east. The principal island is Babelthouap, 28 miles by 14, containing a mountain from whose summit a view of the whole group is obtained. As seen from the sea, the islands appear mountainous and rugged; but the soil is rich and fertile, and water is abundant. Bread-fruit, coconuts, bananas, sugar-cane, lemons, oranges, and other tropical trees and fruits, are grown. Cattle, fowls, and goats thrive, and fish abound on the coasts. The inhabitants, who are estimated at about 10,000 in number, are of the Malay race. They show considerable ingenuity in building their canoes, are active agriculturists, and entertain exceedingly primitive notions regarding dress, as the men go entirely naked, and the women nearly so. In 1783, the *Atalapha* was wrecked upon the P. I., and the crew were treated by the natives with the greatest kindness. Further

acquaintance with white men, however, seems to have altered their disposition, and several vessels, while visiting these islands, within comparatively recent years, have narrowly escaped being cut off. The islands are said to have been discovered by the Spaniards in 1545.

PELICAN (*Pelecanus*), a genus of birds of the family *Pelecanidae* (q. v.), having a very long, large, flattened bill, the upper mandible terminated by a strong hook, which curves over the tip of the lower one; beneath the lower mandible, which is composed of two flexible bony branches meeting at the tip, a great pouch of naked skin is appended; the tongue is very short, and almost rudimentary; the face and throat are naked; the wings of moderate length, the tail rounded. The species are widely distributed, frequenting the shores of the sea, lakes, and rivers, and feeding chiefly on fish. Although birds of powerful wing, they are seldom seen at a great distance from land. All of them are birds of large size. They take their prey by hovering over the water, and plunging upon it when it appears. They often fly in large flocks, and the sudden swoop of a flock of pelicans at a shoal of fish is a striking and beautiful sight. They store up their prey in their pouch, from which they bring it out at leisure, either for their own eating, or to feed their young. The pouch is capable of being wrinkled up into small size, and of being greatly distended.—The COMMON P. (*P. onocrotalus*) is as large as a swan, white, slightly tinged with flesh colour, and in old birds,

Pelican (*Pelecanus onocrotalus*).

the breast golden yellow. The quill-feathers are black, but are scarcely seen except when the wings are expanded. It is a native of the eastern parts of Europe, and of many parts of Asia and Africa, and frequents both the sea-coast and also rivers and lakes. It makes a nest of grass on the ground in some retired spot near the water, often on an island, and lays two or three white eggs. The parents are said to carry water to their young, as well as food, in their pouch. During the night, the P. sits with its bill resting on its breast. The nail or hook which terminates the bill is red, and Mr Broderip supposes that the ancient fable of the P. feeding its young with blood from its own breast has originated from its habit of pressing the bill upon the breast, in order the more easily to empty the pouch, when the red tip might be mistaken for blood.—The RUFOUS-NECKED P. (*P. fuscus*) abounds in the West Indies and in many parts of America. Other species are found in other parts of the world, and in some places the number of pelicans is prodigious, particularly in some of the most southern parts of the world.

In Heraldry, the Pelican is drawn with her wings

endorsed, and wounding her breast with her beak. When represented in her nest feeding her young with her blood, she is called a pelican in her piety.

PE'LION, the ancient name of a wooded mountain range in Thessaly, extending along the east coast. Its eastern side descends in steep and rugged precipices to the sea. Further to the north, near the mouth of the Peneus, is the steep conical peak of Ossa (q. v.), which, according to the classic myth, the Titans placed upon the summit of P., in order to scale Olympus, the abode of the gods. The modern name is Zagorá, and as of old, its sides and summit are clothed with venerable forests of oak, chestnut, beech, elm, and pine.

Pelican, in Heraldry.

PELISSIER, AIMABLE JEAN JACQUES, Marshal of France, Duc de Malakhoff, born in 1794 at Maromme, near Rouen. His father was a small farmer, little above the degree of a peasant. P. was first sent to the Lyceum at Brussels. At twenty, he gained admission to the celebrated French artillery college of La Flèche, and was soon transferred to the special school of St Cyr. He entered the artillery of the Royal Guard as sub-lieutenant in 1814, and being transferred to the 57th Regiment of the line, which was not called upon to do duty after the return of Napoleon from Elba, he escaped the dilemma of declaring either for or against the Emperor. He served on the staff in Spain in 1823; made the campaign of the Morea in 1828; joined the first expedition to Algiers in 1830 as major of cavalry; and in 1839 returned to Algeria with the rank of lieutenant-colonel. He commanded the left wing of the French army at the battle of Isly. In 1845, he acquired an unenviable notoriety by suffocating more than 500 Arabs who took refuge in the caves of Ouled-Kiah in the Dahra. Marshal Soult, then Minister of War, did not venture to approve this atrocity, but Marshal Bugeaud, commander-in-chief in Algeria, declared that P. only carried out his positive orders. By 1850, he had attained the rank of General of Division. When the news of the *coup d'état* reached Algiers, he espoused the cause of the emperor, and placed the province of Algiers under martial law until order was restored. In the war with Russia, he obtained in 1855 the command of the first corps of the Crimean army, and soon succeeded Marshal Canrobert in the chief command, when a change came over the fortunes of the campaign. The Russians were defeated on the Tchernaya, and on the 8th September the Malakhoff, the key of Sebastopol, was carried. After the fall of Sebastopol, P. received a marshal's baton, and on his return to France, was created Duc de Malakhoff and a senator, and received a dotation of 100,000 francs. He also received the order of a G.C.B. from Queen Victoria. In 1858, he came to London as the French ambassador, but resigned his post, for which he had little relish, in the following year. He was then named Governor-general of Algeria, where he died (May 1864) of congestion of the lungs.

PE'LLA, the ancient capital of Macedonia, and the birthplace of Alexander the Great, was situated on a hill, and surrounded by marshes. It was a wealthy and powerful city, but declined under the Romans until it became a place of no consequence, and in the middle ages there remained only a strong castle called *Bodena*. Its site has been identified

with that of the village of Nodding on Teufelberg, which is a spring called Pelle.

PELLAGRA, at one time, the name of a skin-disease, supposed to be endemic to the non-proteining part of the north of Italy, is now employed to designate a group of phenomena, of which the most prominent and significant are rashes. Allied affections have recently been described in various continental countries; but as presented in its most intense form in Lombardy, where rashes to the skin being covered with tubercles and rough scales, in debility, vertigo, inability to preserve the equilibrium, epilepsy, and great depression of spirits. The melanosis which constituted the latter stage often led to suicide, and so frequently to destruction by dysentery, that it was distinguished as a special form of the tendency by the appellation of *Hydnomania*. The extent of the ravages of this affection may be estimated from the facts that of 500 patients in the Milan Lunatic Asylum in 1857, one third were pellagrics; that when Struven wrote (1741), one of every twenty, and when Holland (1817), one of every five or six of the population presented symptoms of the disease. The belief, so long current, that this mainly was the result of the use of rice or maize as the chief article of diet, must now be greatly modified, as it has been observed in districts and under circumstances where the food is of a different description; but where poverty, insufficient nourishment, dirt, toil, and the ordinary agents in human degeneration are at work.

PELLITT, or **OURISS**, is English Herbsire, a *Bombix* (p. 7.) caterpillar.

PELLICO, *PIRELLA*, an Italian poet, celebrated for his long and varied imprisonment by the Austrians, more, perhaps, than for his verse, was born in 1788 at Salorno, in Piedmont, and was educated in Turin, where his father, Giovanni Pellio, also formerly known as a lyric poet, had a silk-factory. In his 16th year, he accompanied his sister Rosina on her marriage to Lyons, where he remained until *Peasie's* *Course de la Segoria* awakened in him a strong patriotic feeling and an irrepressible desire to return to Italy. Coming, about 1810, to Milan, where his family were now settled, he was warmly received by Ugo Foscolo and Vincenzo Monti, and was employed as tutor in the family of Count Perro, in whose house all the most distinguished men in Milan were accustomed to meet. His tragedies of *Lucretia* and *Francesca da Rimini* gained him an immediate name amongst Italian poets. He also translated the *Memorial of Byron*, with whom he had become acquainted. He lived in great intimacy with the most eminent patriots and authors of liberal views, and took an active part in a periodical called *Il Conoscitore*, which after a time was suppressed on account of its liberal tone. Having become acquainted with the secret society of the *Carbonari*, when the dread of the Italian government, it was apprehended in 1820, and sent to the prison of the *Margherita*, where his friend, the poet *Manzoni*, was also confined. In the beginning of the following year, he was carried to Venice, and in January 1822, to the prison on the Isle of San Michele, near Venice, and *Manzoni* and he were at last condemned to death; but the emperor commuted the sentence to 20 years' imprisonment for *Manzoni*, and 16 years for *Pellio*. In March 1822, they were both conveyed to the subterranean dungeons of the Spielberg. In August 1823, however, they were set at liberty. *P.* published on account of his sufferings during his ten years' imprisonment, under the title *Le mie Prigioni* (Pisa, 1828), which has been translated into other

languages, and has made his name familiar where it would not have been known on account of his poetry. *P.*'s health, ever robust, was permanently injured. The Marchioness of Beale rescued him from his house at Turin as her secretary. *P.* subsequently published numerous tragedies and other poems, and a little attention on the subject of man. His death took place January 24, 1834.

PELLITORY, or **PELLITORY OF THE WALL** (*Parietaria*), a genus of plants of the natural order *Urticæ*, having

both unisexual and hermaphrodite flowers on the same plant, the perianth of both kinds 4-lobed. The *Common P.* (*P. officinalis*), which grows on old walls and heaps of rubbish in Britain and many parts of Europe and Asia, is a herbaceous perennial, with prostrate branched stems, more rarely with erect stems, ovate leaves, and small spinous flowers. It sometimes attracts attention from the manner in which the pollen is expelled in hot summer days by an elastic movement of the filaments. It was formerly much esteemed as a diuretic, refrigerant, and lithontriptic. Its properties depend on water which it contains.

PELLITORY OF SPAIN (*Aureolaria pyramidalis*), a plant of the natural order *Compositæ*, of a genus nearly allied to *Chamaemelis* (p. v.), a native of the Levant and of Barbary, and cultivated in some extent in Germany and other countries. It has proeminent, branched, downy stems; each branch one-flowered; the root-leaves pinnate, with pinnatifid segments and linear-subulate lobes. The flowers (heads of flowers) have a white ray, purplish beneath, and a yellow disc. The root is spindle-shaped and fleshy, and when dried, is about the thickness of the little finger, insensuous, breaking with a resinous fracture. It has a very peculiar taste, slight at first, but becoming acridulous, saline, and acrid, with a burning and tingling sensation in the mouth and throat, which continues for some time. It is valued in medicine, and is elevated or administered in the form of a tincture to relieve toothache, also in cases of paralysis of the tongue, as a cathartic in certain kinds of hæmorrhoids, and of rheumatic and neuralgic affections of the face, and is used as a gargle in relaxation of the uvula. The powder of it enters into the composition of certain cephalic snuffs, and is rubbed on the skin in some eastern countries, to promote perspiration. It is the *Radic pyramidalis* of the pharmacopœia. It is a powerful local irritant. The plant cultivated in Germany has more slender roots than that of the Levant, and has sometimes been described as a distinct species (*P. officinalis*), but is probably a mere variety.

Pellitory (*Parietaria officinalis*).

PELLS, CLERK OF TRE (Lat. *pellis*, a skin), a clerk belonging to the Court of Exchequer in England and Ireland, whose office was to enter every teller's bill into a parchment or skin, called *pellis receptorum*, and also to make another roll of payments, which was called *pellis exitum*, and which shewed the warrant under which the money was paid. The office was abolished in 1834 by the statute 4 and 5 Will. IV. c. 16, which transferred the duties to the comptroller-general, who thereupon assumed the custody of the records; and the Treasury thereafter established new forms of books, accounts, and warrants.

PELOPIDAS, a celebrated Theban general, of noble descent, noted among his fellow-citizens for his disinterested patriotism. The inviolable friendship between himself—one of the richest men in Thebes—and Epaminondas—one of the poorest—is among the most beautiful things recorded in Greek history. In 382 B.C. he was driven from Thebes by the oligarchic party, who were supported by the Spartans, and forced to seek refuge at Athens, whence he returned secretly with a few associates, 379 B.C., and recovered possession of the Kadmeia, or citadel, slaying the Spartan leader, Leontiades, with his own hand. Plutarch gives us a vivid picture of the adventurous exiles gliding quietly in disguise into the city on a winter afternoon, amid bitter wind and sleet. Having been elected Boeotarch, in conjunction with Melon and Charon, he set about training and disciplining his troops, so that they soon became as formidable as the Lacedæmonians, and were successful in several small encounters with the latter. His 'sacred band' of Theban youth largely contributed to the victory of Epaminondas at Leuctra (371 B.C.), but failed in a subsequent attack on Sparta itself. In the expedition of the Thebans against the cruel tyrant, Alexander of Phææ (368 B.C.), he was, after several important successes, treacherously taken prisoner, when in the character of an ambassador; but was rescued by Epaminondas in the expedition of the following year. He was then sent to Susa, as ambassador from Thebes, to counteract the Spartan and Athenian intrigues going on at the court of Persia, and behaved himself very nobly while there. His diplomacy was successful. In 364 B.C., a third expedition was planned against Alexander of Phææ, who, as usual, was threatening the Thesalian towns. The command was given to P., and in the summer he marched into Thessaly, where he won the battle of Kythoskephalæ, but was himself killed while too eagerly pursuing the foe. He was buried by the Thesalians with great pomp.

PELOPIUM was the name given, about the beginning of the present century (1802), by Rose to a new metal, which he thought he had discovered in the mineral Columbite. It was subsequently ascertained that it was identical with Niobium.

PELOPONNESIAN WAR. See GREECE.

PELOPONNESUS (i.e., the isle of Pelops), now called the Morea (q. v.), a peninsula, which formed the southern part of ancient Greece, Hellas Proper being situated to the northward of the isthmus, on which stood the city of Corinth. See GREECE. The whole area is less than 9000 square miles. In the most flourishing periods of Grecian history, the P. had a population of more than two millions, although at present it has little over half a million. Among its most important cities were Sparta in Laconia, and Argos the capital of Argolis. Sparta acquired, after the Messenian War, a decided supremacy over the other states, and disputed the supremacy with Athens in a war of almost thirty years' duration (431–404 A.C.)—

the famous 'Peloponnesian War,' of which the history has been written by Thucydides. After the Roman conquest, the P. formed part of the province of Achaia, and subsequently belonged to the Byzantine empire. For its later history, see MOREA.

PELOPS, in Greek Mythology, the grandson of Zeus, and the son of Tantalus, was slain by his father, and served up at an entertainment which he gave to the gods, in order to test their omniscience. They were not deceived, and would not touch the horrible food; but Ceres, being absorbed with grief for the loss of her daughter, ate part of a shoulder without observing. The gods then commanded the members to be thrown into a cauldron, out of which Clotho brought the boy again alive, and the want of the shoulder was supplied by an ivory one. According to the legend most general in later times, P. was a Phrygian, who, being driven by Ilos from Siplyos, came with great treasures to the peninsula, which derived from him the name of Peloponnesus, married Hippodamia, obtained her father's kingdom by conquering him in a chariot-race, and became the father of Atreus, Thyestes, and other sons. But in what appear to be the oldest traditions, he is represented as a Greek, and not as a foreigner. He was said to have revived the Olympic games, and was particularly honoured at Olympia.

PELTRY, a general term applied to the trade in skins of wild animals, and to the skins themselves. It is understood to mean only skins undressed, except by drying, and chiefly those which, when dressed, are called furs, and it is especially applied to the produce of North America and the Hudson's Bay Territory, although all others are included. The following table will shew the kind of skins meant, and the vast destruction of animal life which is necessitated by this valuable branch of commerce.

PELTRES IMPORTED INTO GREAT BRITAIN IN 1880.

Common Name.	From Hudson's Bay Territory.	From other Countries.	Total Imports.

The pelts of some animals in their original state do not appear well fitted for decorative or even ordinary use, but the art of the tanner changes them greatly. The recent discovery, that the long hairs which project over the line underfur of many species, are also deeper rooted in the skin, has given rise to an easy and admirable method of removing them very completely. The pelts are stretched and passed through a tanning-machine, which passes the American with such nicety that it takes off a thin layer, and cuts only through the roots of the coarse, deep-rooted hairs, which are consequently easily shaken or brushed out. In this way, and by dyeing the fur, beautiful imitations of the costly seal-skins, &c., are prepared from marten, beaver, and other common pelts.

PELUSIUM, the Greek name of an ancient Egyptian city, situated at the north-eastern angle of the Delta, and important as the key of Egypt on the Asiatic side. The eastern mouth of the Nile derived from it the epithet Pelusiac (græc. *Pelusiacus*). It is called *Sis* in the Old Testament, and both words, as well as the native Egyptian or Egyptian name *Pesumet*, or *Pesut*, signify the mud city. The *Antiquities Pelusiensis* was shod up with sand as long ago as the 16th a. d., and its distance from the sea has ever since been increasing. It appears to have originally borne the name of *Alus*, or *Abus*. It is so called by Strabo, who attributes its foundation to the Hyksos about 2600 a. d.; but it first figures in Assyriotic history as the scene of Sennacherib's defeat, when (according to the Egyptian tradition, as reported by Herodotus), the camp of the Assyrians was invaded at night by a host of *Beluchians*, who gnawed their bowstrings and shield-ropes, so that in the morning, when the Egyptians fell upon them, they were defenceless. For the Hebrew account of Sennacherib's defeat see 2 Kings, chaps. 19 and 19. In 525 a. c., Cambyses overthrew, near P., the forces of Pharaoh Psammethicus. The city was also taken by the Persians in 509 a. c.; and in 173 a. c. it was the scene of the defeat of Ptolemy Philometor by Antiochus Epiphanes. Mark Antony captured it, 55 a. c.; and it opened its gates to Octavian after his victory at Actium, 31 a. c. Its later history is unimportant, and its ruins—at *Tinê*, near Damietta—possess little interest.

PELVIS, *Tas* (from the Latin *pelvis*, a basin), is a bony ring interposed between the spinal column and the lower extremities, so as to transmit the weight of the former to the latter. Before considering the pelvis as a whole, it will be expedient to consider the individual bones of which it is composed. These, in the adult, are four in number, viz. the two *ossa innominata* which constitute the sides and front, and the sacrum and coccyx, which complete it behind. The *os innominatum* owes its name from its bearing no resemblance to any known body, and is a large irregular-shaped bone. In the young subject, it consists of three separate zones, which meet and form the deep, cup-shaped cavity (the *acetabulum*), situated a little below the middle of the outside of the bone, and in which the head of the thigh-bone rests. When it is usual to describe this bone as consisting of the ilium, the ischium, and the pubes. The *ilium* is the superior, broad, and expanded portion which bears the prominence of the hip, and articulates with the sacrum. This bone may be described as divided into an external and an internal surface, a base and an anterior and posterior border. The external surface (see fig. 1.) is convex in front, and concave behind; it is bounded above by the crest,

below by the upper border of the acetabulum (see fig. 11.), and in front and behind by the anterior and posterior borders. It presents various curved lines and rough surfaces for the attachment of the gluteus and other powerful muscles connecting the pelvis and the lower extremities. The internal surface, which is smooth and concave, has the same inequalities as the external, except inferiorly, where it terminates in a prominent line, termed the *linea obliqua interna*. The surface of the bone is convex, roughened, and sufficiently broad to admit of the attachment of three planes of muscles. The borders will be sufficiently indicated by a reference to fig. 1. The *ischium* is the inferior and strongest

Fig. 1.

The *Os Innominatum* of the right side.

1, the ilium, its external surface; 2, the ischium; 3, the os pubis; 4, the crest of the ilium; 5, 6, upper and lower curved lines for attachment of muscles; 7, the surface for attachment of the gluteus maximus; 8, 9, the anterior superior and inferior spines; 10, 11, the posterior superior and inferior spines; 12, the spine of the ischium; 13, 14, the greater and lesser sciatic foramina; 15, the tuberosity of the ischium; 16, its ramus; 17, the body of the os pubis; 18, its ramus; 19, the acetabulum; 20, the foramen of the lesser sciatic foramen. (From Wilson.)

portion of the bone. It consists of a thick and solid portion, the *body* (whose inferior border is termed the *tuberosity*), and a thin ascending portion, the *ramus*. In the ordinary sitting position, the whole weight of the body rests on the ischium; and by sitting on the muscle, we can usually feel the part (the *tuberosity*, see fig. 1. 15) through which the weight is transmitted. The *pubes* is that portion which runs horizontally inward from the inner side of the acetabulum for about two inches, and then descends obliquely outward for about the same length, thus making an acute angle with its original direction. The former part is called the *ledge*, and the latter the *ramus*, of the pelvis. The ramus is continuous with the ramus of the ischium. Between the ischium and pubes is a large aperture, known as the *foramen of the lesser sciatic foramen*, which in the living body is closed by a membrane termed the *obturator foramen*. The object of this large foramen is probably to give lightness to the parts, without materially diminishing their strength.

The development of the *os innominatum* affords an excellent example of the general principles laid down in the article *OSTEOGENESIS*. There are no less than eight centres of ossification for this bone: three primary—one for the ilium, one for the

PELVIS.

Each os innominatum articulates with its fellow of the opposite side (through the intervention of the *interosseous fibro-cartilage*, which unites the two surfaces of the pubic bones, see fig. II. f), with the sacrum, and with the femur (at the acetabulum). No less than thirty-five muscles are attached to this bone, some proceeding to the region of the back, others forming the walls of the abdomen, others forming the floor of the pelvis, others passing downwards to the lower extremities, &c. As the other

Fig. II

Pelvis (with Fifth Lumbar Vertebra) of European Female Adult. Transverse diameter, 5.7; antero-posterior diameter, 4.5 inches.

1, the last lumbar vertebra; 2, the inter-vertebral substance connecting it with the sacrum; 3, the promontory of the sacrum; 4, its anterior surface; 5, the coccyx; 6, 6, the iliac fossæ; 9, the acetabulum; *a*, the tuberosity, and *b* the body of the ischium; *c*, the os pubis; *f*, the symphysis pubis; *g*, the arch, *h*, the spine, and *k* the pectineal line of the pubis; *k*, *l*, *k*, *l*, the ilio-pectineal lines. (From Humphry.)

bones entering into the formation of the pelvis, the sacrum, and the coccyx, belong essentially to the vertebral column, and will be described in the article on that subject, it is sufficient here to remark that, collectively, they form a triangular bony mass (with the base upwards, and with a concave anterior surface), which constitutes the posterior part of the pelvic ring. See fig. II. 4, 5.

The pelvis, considered as a whole, is divisible into a false and true pelvis. The *false pelvis* is all that expanded portion which is bounded laterally by the iliac bones, and lies above the prominent line termed the *linea ileo-pectinea* (see fig. II. k, l); while the *true pelvis* is all that part of the general pelvic cavity which is situated below that line. The broad, shallow cavity of the false pelvis serves to support the weight of the intestines; while the rectum, bladder, and part of the generative organs, lie in the cavity of the true pelvis. The upper aperture of the true pelvis is termed the *inlet*. It is somewhat

heart-shaped in form, and has three principal diameters—an *antero-posterior* (or *sacro-pubic*), which extends from the angle formed by the sacrum with the last lumbar vertebra to the symphysis pubis, or point of union of the two pubic bones; the *transverse*, at right angles to the former, and extending across the greatest width of the pelvis; and the *oblique*, extending from the sacro-iliac symphysis (or union), on one side, to the margin of the brim corresponding with the acetabulum on the other. The diameters of the outlet are two—an *antero-posterior*, extending from the tip of the coccyx to the lower part of the symphysis pubis; and a *transverse*, from the posterior part of one ischiatic tuberosity, to the same point on the opposite side. As the precise knowledge of the diameter and depth of the pelvis is of the greatest importance in the practice of midwifery, we give the average numbers representing the dimensions of a well-formed adult female pelvis. *Diameters of inlet or brim*—antero-posterior, 4 1/4 inches; transverse, 5 1/4 inches; oblique, 4 3/8 inches. *Diameters of outlet*—antero-posterior, 5 inches; transverse, 4 3/8 inches. *Depth of the true pelvis*—posteriorly, 4 1/2 inches; in the middle, 3 1/2 inches; anteriorly, 1 1/2 inches.

The pelvis is placed obliquely with regard to the trunk of the body; the plane of the inlet to the true pelvis forming an angle of from 60° to 65° with the horizon. According to Naegele (*Ueber das weibliche Becken*), the extremity of the coccyx is in the female, when standing upright, about seven lines higher than the lower edge of the symphysis pubis; the upper edge of the symphysis being at the same level as the lower edge of the second segment of the coccyx. By attention to these data, a detached pelvis may readily be placed at the angle at which it normally lies in the skeleton. The shape of the human pelvis is much affected by the curving forward of the lower part of the sacrum. This bend of the sacrum forward serves to support the viscera, when the body is in an erect posture; but it is of much more importance in its relation to the act of parturition. If all the antero-posterior diameters of the true pelvis from the brim to the outlet were bisected, the points of bisection would form a curved line, similar to the curve of the sacrum, and termed the *axis* of the pelvis. As the head of the child has to follow this curve, the difficulties of parturition are much greater than if the axis of the pelvis had been straight, as in the other vertebrata. Without entering into unnecessary details, we may remark generally, that the foetal head is of oval shape, with its greatest diameter from before backwards, and that in its passage through the pelvis it is so placed that its longest diameter at each stage of labour coincides with the longest diameter of the pelvis. The head enters the pelvis with the occiput (or back of the skull) being directed towards one ilium, and the face towards the other, while, at its final emergence, the face is turned towards the sacrum and coccyx. There can be no doubt that the screw-like or rotatory motion which is thus given to the foetal head, renders its passage through the pelvis more easy than it would otherwise have been.

There are well-marked differences, chiefly having reference to the act of parturition, between the male and female pelvis. In the female, the bones are lighter and more delicate than in the male, and the muscular impressions and eminences are less distinctly marked. The iliac fossae are large and expanded, and hence the great prominence of the hips. The several diameters (particularly the transverse diameter of the brim, which measures only 5 1/2 inches in the male) are somewhat greater; and the

point arch is wider by about two degrees; the sacrum also is wider and less curved.

It is worthy of notice that the pelvis of the negro is smaller in all its dimensions than that of the

Fig. 111.

Human, Indian, Chimpanzee, Gorilla, Orang-utan, and various monkeys, &c. (From Huxley.)

European, and presents a partial approximation to that of the monkey (fig. 111), especially in its width. This difference is very much more obvious in the male than in the female negro; and particularly in the black race is facilitated both by the sacrum being less curved, and by the lateral head being of smaller dimensions. In the apes and monkeys, which approach most nearly to man, the pelvis is larger and narrower, and much less curved than in the human subject. In other mammals, the differences are for the most part the same in kind, but greater in degree. In many of the Chiroptera (bats) and Insectivora (as the mole), the pelvic bones are only loosely connected by a small ligament, or there is complete osseous union between the bones (as occurs usually in birds), an arrangement by which the act of parturition in these animals is much facilitated. The pelvic bones are very simple in the Cetacea, in some cases being represented by two simple elongated bones lying near the axis, and covering long opposite sides (a transverse connecting piece being sometimes but not always present); in others, by a small Y-shaped bone, while sometimes (as in Manatus) they seem to be entirely wanting. The additional pelvic bones in the non-placental mammals have been already noticed in the articles on the *Macrotis* and *Macrodon*. In the whales (belonging to the latter order), the acetabulum is present, as occurs normally in birds. In birds, in addition to the peculiarity just noticed, we find the pelvic girdle in front (or more correctly, inferiorly) being formed by union of the pelvic bones in any bird except the ostrich. This normal incompleteness of the pelvic arch is obviously for the purpose of facilitating the passage of the eggs. It is unnecessary to trace the further development of the pelvic bones in the Monotremes and Protes.

PEMBROKE, a seaport of South Wales, a market-town, and municipal and parliamentary borough, in the county of the same name, occupies a rocky ridge on a navigable creek of Milford Haven, 7 miles southeast of Milford. On the extremity of the ridge on which the town is built, are the remains of its once extensive castle. In 1584, the castle was beleaguered by Cromwell, and taken after a siege of six weeks. Within this walled stronghold, Henry VII. was born in 1457. To keep the principal building in the inner court, 1175 feet high, and 133 feet in circumference, and is surrounded by a semi-circular wall of masonry, still perfect. Farther off, within the Pembrokeshire Dock, which is still a shipbuilding than a commercial centre, is two miles from the town, and has 12 buildings and a dry dock. The entire naval establishment embraces an area of 80 acres, and is surrounded by a high wall flanked by two martello towers. Within P. are St Michael's, a church of Norman date, and numerous ecclesiastical and educational institutions. Pop. (1861) of parliamentary borough,

which is co-extensive with the municipal borough, 15,071. P. unites with Tenby, Milford, and Wiston in sending a member to parliament.

PEMBROKE COLLEGE, Oxford, BRISTOLIAN HALL, a place of education, originally belonging in part to St Fydwyn's Priory, and in part to the monastery of Abingdon, was, on the dissolution of the religious houses, given to Christ Church by Henry VIII. In 1620, it was made a college by James I., and took its name from the Earl of Pembroke, then chancellor of the university. By the ordinance of the commissioners under 17 and 18 Viet. c. 61, the constitution of the college is now as follows: There are to be not less than 10 fellows, open to all, and to remain 4500 a year in value, so long as the number of the fellows is less than 10. There are not to be less than 10 incorporated scholarships, value 450 a year, and seven of these, 4 are open & filled up from Abingdon School. There are besides 11 other scholarships, subject to various conditions. This college presents to a *lectio*, at which it have been purchased since 1812.

PEMBROKE COLLEGE, CAMBRIDGE, was founded in 1347 by Mary de St. Paul, the widow of Aymer de Valence, Earl of Pembroke. She was maid, wife, and widow all in one day, her husband being slain at a tilting match held in honour of her nuptials. On this sad event, she sequestered herself from all worldly delights, and hushed her estate to pious uses. Henry VI. was in literal a benefactor to this college as to obtain the name of a second founder. There are 16 fellowships and 24 scholarships of different values.

PEMBROKESHIRE, a maritime county of South Wales, and the westernmost county of the Principality, is bounded on the E. by the Bristol Channel, and on the W. and N. by St George's Channel. Area, 627 square miles, or 401,091 acres. Pop. (1861) 96,278. The river Teivy separates the county on the north-east from that of Cardigan. On the north are Newport and Fishguard Bays, the latter 5 miles in width, from 20 to 70 feet in depth, and with good anchoring-ground. Off St David's Head, on the west coast, are a number of rocky islets, called the Bishop and his Clerks. St Bride's Bay, the widest inlet, is 5 miles in width, and has an inland sweep of 7 miles. Milford Haven (q.v.) is the most important estuary. The shores on the south are wild and inhospitable, and fringed by high precipitous cliffs. The surface is undulating; green hills alternate with fertile valleys. The principal elevations occur in the Preselly Hills, which traverse the north of the county from east to west, and rise in their highest summit to the height of 1754 feet. The rivers of the greatest importance are the Eastern and Western Cloddon, which unite and form a navigable portion of Milford Haven. None of the rivers, of which the Western Cloddon is the principal, are important. The climate is mild, but drier in the south of the county; while in the north, the temperature is considerably lower. There are excellent and productive soils in the south, and along the north-west coast the barley districts are famous; but the land on the Preselly Mountains and in the coal districts is inferior. Coal, slate, lead, and iron are the only minerals worked. The county is penetrated by the great coal field of South Wales, which, entering from the east, narrows as it approaches St. Bride's Bay. The coal, which is anthracite, and is contained in beds of shale and sandstone, occurs in veins, varying in thickness from a few inches to 8 feet, and sometimes more. Oats, barley, and potatoes are the principal crops. The county returns one member

to parliament. The chief towns are Haverfordwest, St Davids, Pembroke, and Tenby.

PEMMICAN. This was originally a North American Indian preparation only, but it was introduced into the British navy victualling-yards, in order to supply the arctic expeditions with an easily-preserved food, containing the largest amount of nutriment in the smallest space. As made by the Indians, it consists of the lean portions of venison dried by the sun or wind, and then pounded into a paste, and tightly pressed into cakes; sometimes a few fruits of *Amelanchier ovata* are added, to improve the flavour. It will keep for a very long time uninjured. That made for the arctic voyagers was chiefly of beef. In making pemmican, it is necessary to remove the fat completely.

PEMPHIGUS, or **POMPHOLYX**, belongs to that order of skin-diseases which is characterised by an eruption of large vesicles, filled with serous fluid, and known as *bullæ*. The disease occurs both in the acute and in the chronic form. In a mild case of acute pemphigus, bullæ, or blisters, from the size of a pea to that of a chestnut appear in succession (chiefly on the extremities), and having continued three or four days, break, form a thin scab, and soon heal, unaccompanied with febrile or inflammatory symptoms. In severe cases, there is considerable constitutional disturbance; the bullæ are larger, and the scabs heal with difficulty. The chronic form differs mainly from the acute by its prolonged continuance. The acute variety chiefly affects children, and has been ascribed to dentition, errors of diet, &c.; while the chronic form chiefly attacks aged persons, and is probably due to debility and impaired nutrition. The acute form usually requires nothing but cooling medicines and diet, and mild local dressings, such as simple cerate, to protect the raw surfaces from exposure to the air. In the chronic form, a nutritious diet, with the judicious use of tonics (iron, bark, &c.), is most commonly successful. In obstinate cases, arsenic is sometimes of use.

PEN, an instrument for writing with a fluid. In ancient times, a kind of reed (Lat. *Calamus*) was chiefly used, though sometimes the letters were painted with a fine hair-pencil, as among the Chinese at the present day. Quill-pens (see **QUILLS**) probably came into use after the introduction of modern paper. The English name pen is from Lat. *penna*, a feather; but the old form of *penna* was *pena* or *petna* (= Gr. *peteron*), from the root *pet*, to fly; and just as Lat. *ped* is identical with Eng. *foot* (see letter F), so *petna* or *peteron* corresponds to *feather* (Ger. *feder*). During last century, many efforts were made to improve the quill-pen, the great defect of which was its speedy injury from use, and the consequent trouble of frequent mending; moreover, even the most skilful maker could not insure uniformity of quality, and any variation affected the writer's work. These efforts were chiefly directed to fitting small metal or even ruby points to the nib of the quill-pen; but the delicacy of fitting was so great, that but very little success attended the experiments. At the beginning of this century, pens began to be made wholly of metal; they consisted of a barrel of very thin steel, and were cut and slit so as to resemble the quill-pen as closely as possible. They were, however, very indifferent, and being dear (the retail price at first was half-a-crown, and subsequently sixpence), they made but little way; their chief fault was hardness, which produced a disagreeable scratching of the paper. In 1820, Mr Joseph Gillott, who dealt in the metal pens then made, hit upon an improvement, which,

by removing this great defect, gave a stimulus to the manufacture, which has caused it to be developed to an extent truly marvellous. This consisted in making three slits instead of the single one formerly used, and by this means much greater softness and flexibility were acquired. Mr Gillott also introduced machinery for the purpose of carrying out his improvements, and thereby so reduced the cost of production, that he was enabled to sell his improved pens in 1821 at £7, 4s. per gross, which was then considered a remarkable success. Better pens are now sold at twopence per gross by the same manufacturer; or, in other words, 864 pens for the same price as one pen in 1821. Nor is this to be wondered at, when we are acquainted with the wonderful ingenuity of the machinery by which it is effected. The lowest-priced pens are made almost entirely by machinery, but the better ones require much hand-labour for their completion; nevertheless, in the works of Mr Gillott alone, who is only one of several large manufacturers in Birmingham, the annual production is now nearly 150,000,000 pens, requiring a supply of five tons per week of the fine sheet-steel made for the purpose in Sheffield, a portion of which is returned as scrap or waste for re-manufacture. From Sheffield the steel is sent in sheets about eight feet long by three feet broad; it is prepared from the best iron, generally Swedish *bloom*. The manufacturer then prepares it by dipping for a short time in dilute sulphuric acid, which removes the *scale* or black surface; the acid itself is also carefully removed by immersion in clean water; the sheets are then passed backwards and forwards through

a rolling-mill with smooth rollers, which reduces the steel to the exact thickness required, and gives it greater compactness; it is next slit into strips of various widths according to the kind of pen to be made; for the ordinary kind its width is seen in fig. 1. This is then passed through a cutting-machine, which rapidly punches out pieces of the shape shewn in fig. 2, and in the order shewn in fig. 1, which is a portion of the strip with the pieces or blanks, as they are called, cut out; that which is represented is the waste or scrap

Fig. 1

previously referred to. The blanks are now passed through a succession of operations, each conducted by a separate person: women or girls are chiefly employed. The first process is called *slitting*; they are passed one by one into a cutting-machine worked by a small hand-lever, which makes the two side slits, as seen in fig. 3. The second process, called *piercing*, is performed by a similar machine or hand-press, in which, however, only one punch acts, and that cuts out the small hole seen in fig. 4. The repeated rolling and stamping of the metal has by this time made it hard and brittle, and it is necessary to anneal it, for which purpose some thousands of the *slit* and *pierced* blanks are put into an iron box, and placed in the fire for a time, which softens them considerably; this is the third process. When cold, another operator receives them, and with

another hand-press and a punch stamp or mark, as it is called, the name of the maker, fig. 6, which constitutes the fourth process. The fifth is somewhat smaller, and is sometimes omitted; it consists

in placing it under another press, which has a punch and die for embossing any ornamental mark. The sixth process, called *rounding*, consists in passing it into another press, which has a convex and grooved die, as in fig. 9. The last stage is a pushed under

Fig. 4.

The maker *e*, is passed by the action of the lever into its groove *f*, and comes out with its edges curved as in *g*. The seventh process consists in *hardening*, which is done by placing the pens in an iron box or muffle, and when they are at a red heat, throwing them into oil: this renders them exceedingly brittle and hard, too much so, indeed, for they have now to pass through the eighth or *tempering* process, which brings them to the required temper of softness and elasticity. The ninth operation is *rounding*; this consists in putting a large number into a tin cylinder, which is kept revolving by machinery; sand and emery powder are mixed with them; and the friction of these materials and of the pens themselves cleanses them from all impurities, and brings out the natural colour of the metal. The tenth and eleventh processes consist in grinding the outside of the nib, first lengthwise (fig. 7), and then crosswise (fig. 8), which are done by different persons at separate grinding-wheels. Next follows the most important operation, constituting the twelfth process or *slitting*—that is,

making the central slit, upon the depth of which the whole value of the pen depends. This is done at a hand-press similar to the others, but the working part consists of two chisels, one fixed and the latter being coming down on

the depression of the lever, and so accurately adjusted as to just clear each other. The operator then skillfully holds the pen lengthwise on the fixed chisel, and brings down the movable one so as to effect the beautifully clean cut which constitutes so important a feature in the manufacture. Two other processes, the thirteenth and fourteenth, finish the series: the first is *colouring*, by heating them in a revolving cylinder over a charcoal stove, which gives them a blue or yellowish colour, according to the time employed; and the last is *varnishing* them with a varnish composed of lac and naphtha. In the works of Messrs Gillott, from inspection of which we have gathered these facts, there are 400 women and 100 men employed, and the daily produce is enormous: a clever girl will cut out 14,000 pens per day, and a good stuffer will do 20,000. Besides the kind especially described above, many other forms are made, especially the large and small barrel pens; but the processes are all the same, or are modifications of those described. Gold pens are extensively made in Birmingham, and as they resist the corrosive action of the ink, they are very durable. Their durability is also greatly increased by the numerous but difficult process of *soldering* on to the points of the nib minute particles of iridium, which, from their extreme hardness, resist wear for many years. The manufacture of iridium-pointed pens is extensively carried on in the city of New York, where the process is said to have been first brought to perfection.

PEN HOLDERS are small turned sticks, usually of cedar, and gassed with a steel cylinder to fix the pen. They are used only for metal pens, and are now made by machinery, which is so ingenious, that it turns the cedar, previously cut into square sticks, round, often in a spiral or otherwise ornamental style, cuts them to the required length, and polishes and varnishes them.

PENAL SERVITUDE is a sentence for criminal offences, which was recently introduced in lieu of the sentence of transportation beyond the seas. See **CONVICT**; **TRANSPORTATION**.

PENALTY is a sum of money declared by some statute or contract to be payable by one who commits an offence or breach of contract. It is considered as a kind of punishment, and constituting indirectly a motive to the party to avoid the commission of the act which induces such a consequence. Many contracts executed between parties contain a clause that one or other of them who fails to perform his part of the contract, will incur a penalty, i.e., will be liable to pay a fixed sum of money to the other party. In such cases, a distinction is drawn between a liquidated and unliquidated penalty; and whether it is of the one kind or the other, depends on the language used in the contract. If it is a liquidated penalty, then, when the breach of contract is committed, the party in default must pay that precise sum, neither more nor less; but if it is unliquidated, then he is not to pay the whole sum, but merely such part of it as corresponds to the amount of injury or damage done, and of which proportion a jury is the sole judge in an action of damages. In statutes, when penalties are declared to follow on certain illegal acts, the sum is sometimes fixed, but in many cases only a maximum sum is stated, it being left to the court or the justices who enforce the penalty what is a sufficient punishment for the offence. Sometimes penalties can only be sued for by the parties immediately injured; but, as a general rule, and unless it be otherwise restricted, anybody may sue for the penalty, for it is an offence against public law, where there is no public prosecutor, any person who chooses

may set the law in motion. Accordingly, not only may anybody in general sue for the penalty, but an inducement is offered by declaring the party who does so to be entitled to the whole or a half of the penalty. Without such inducement, many offences would be unpunished. The party who so sues is generally called the informer. Thus, in offences against the game laws, anybody may sue for the penalty, and he is entitled to half of it. Sometimes the penalty can only be sued for in the superior courts of law; but in the great majority of instances, the enforcing of penalties is part of the administration of justice before justices of the peace. It is for the justices to fix the amount if they have (as they generally have) a discretion to do so. If it is not paid, the justices may issue a distress-warrant, authorising a constable to seize and sell the goods of the party to pay the fine; and if there are no goods, then the justices may commit the party to prison as a substitutionary punishment. Sometimes justices have a discretion either to impose a penalty or commit the party to prison as an alternative punishment. All these matters depend on the construction of particular statutes.

PENANCE (Lat. *penitentia*), in Roman Catholic theology, means the voluntary or accepted self-inflicted punishment by which a repentant sinner manifests his sorrow for sin, and seeks to atone for the sin, and to avert the punishment which, even after the guilt has been remitted, may still remain due to the offence. Penance is believed in the Roman Catholic Church to be one of the sacraments of the New Law. It will be necessary to explain it briefly both under its relations as a sacrament, and as a private personal exercise.

Penance must be carefully distinguished from repentance, which is simply sorrow for evil-doing, accompanied with a purpose of amendment. Penance is the fruit or the manifestation of this sorrow, and it is commonly accompanied or expressed by some of those external acts which are the natural manifestations of any deep sorrow, either negative, as the neglect of ordinary attention to dress, to the care of the person, to the use of food; or positive, as the direct acts of personal mortification and self-inflicted pain, such as fasting, wearing haircloth, strewing the head with ashes, watching of nights, sleeping hard, &c. Such manifestations of sorrow, whether from motives of religion or from merely natural causes, are common among the eastern races, and are frequently alluded to in the Scripture. In the personal practice of the early Christians, penance found a prominent place, and the chief and acknowledged object of the stated Fasts (q. v.), and other works of mortification which prevailed, was that of penitential correction, or of the manifestation of sorrow for sin.

A still more striking use of penance, however, in the early church, was the disciplinary one; and this, in the Roman Catholic view, is connected with the sacramental character of penance. Any discussion of this purely theological question would be out of place here, and it will be enough to state briefly that Roman Catholics number penance among the Seven Sacraments (q. v.), and believe it to be of direct divine institution (Matt. xvi. 19, xviii. 18; John xx. 21). The matter of this sacrament consists, in their view, of the three acts of the penitent—contrition, or heartfelt sorrow for sin, as being an offence against God; confession, or detailed accusation of one's-self to a priest approved for the purpose; and satisfaction, or the acceptance and accomplishment of certain penitential works, in atonement of the sin confessed; and the form of the sacrament is the sentence of absolution from

sin pronounced by the priest who has received the confession, and has been satisfied of the penitential disposition of the self-accusing sinner. In all these points, of course, they are at issue with Protestants. Even in the apostolic times, the practice prevailed of excluding persons of scandalous life from the spiritual fellowship of the Christian community (see EXCOMMUNICATION); and without attempting to fix the date, it may be stated as certain, from the authority of Tertullian and other writers, that from a very early time the persons so excluded were subjected to certain penitential regulations. The class of offenders so treated were those who had been notoriously guilty of the grievous crimes of idolatry or apostasy, murder, adultery, and other scandalous offences. The period of penitential probation differed in different times and places, but in general was graduated according to the enormity of the sin, some going so far in their rigour (see NOVATION) as, contrary to the clearly-expressed sense of the church, to carry it even beyond the grave. In the earlier ages, much depended upon the spirit of each particular church or country; but about the 4th c., the public penitential discipline assumed a settled form, which, especially as established in the Greek Church, is so curious that it deserves to be briefly described. Sinners of the classes already referred to had their names enrolled, and were (in some churches, after having made a preliminary confession to a priest appointed for the purpose) admitted, with a blessing and other ceremonial, by the bishop to the rank of penitents. This enrolment appears to have commonly taken place on the first day of Lent. The penitents so enrolled were arranged in four grades, called—1. (Gr. *prosklaíontes*, Lat. *fentes*) 'Weepers'; 2. (Gr. *akroōmenoi*, Lat. *audientes*) 'Hearers'; 3. (Gr. *Angustopiptantes*, Lat. *prosternentes*) 'Prostraters'; 4. (Gr. *syntantes*, Lat. *consistentes*) 'Standers'. Of these classes, the first were obliged to remain outside of the church at the time of public worship, and to ask the prayers of the faithful as they entered. The second were permitted to enter and to remain in the place and during the time appointed for the Catechumens (q. v.); but, like them, were required to depart before the commencement of the solemn part of the Liturgy (q. v.). The third were permitted to pray with the rest, but kneeling or prostrate, and for them were prescribed many other acts of mortification. The fourth were permitted to pray with the rest in a standing posture, although apparently in a distinct part of the church; but they were excluded from making offerings with the rest, and still more from receiving the communion. The time to be spent in each of these grades at first differed very much according to times and circumstances, but was afterwards regulated by elaborate laws, called penitential canons. Still it was in the power of the bishop to abridge or to prolong it; a power, the exercise of which is connected with the historical origin of the practice of Indulgence (q. v.). Of these four grades, the first two hardly appear in the Western Church. It is a subject of controversy whether, and how far, this discipline was extended to other than public sinners; but it seems certain that individuals, not publicly known as sinners, voluntarily enrolled themselves among the penitents. All four grades wore a distinguishing penitential dress, in which they appeared on all occasions of public worship, and were obliged to observe certain rules of life, to renounce certain indulgences and luxuries, and to practise certain austerities. In some churches, they were employed in the care of the sick, the burial of the dead, and other of the more laborious works of charity. The penitent, in

ecclesiastical court, could only be restored to communion by the bishop who had excommunicated him, and this only at the request of the excommunicated man, unless the bishop himself had absconded; but, in case of dangerous illness, he might be restored, with the sanction, however, that, if he recovered from the illness, the whole course of penance should be repeated. The reconciliation of penitents took place commonly in Holy Week, and was publicly performed by the bishop in the church, with prayer and imposition of hands. It was followed by the administration of communion. If any of the clergy were guilty of a crime to which public penance was annexed, they were first deposed from the rank of the clergy, and then subjected to the ordeal, like the laity themselves. This public discipline continued in force with greater or less exactness in the 15th, 16th, and 17th centuries, gradually, however, being replaced by secret public, and ultimately by private penance. In the 17th and 18th centuries, the public penance had entirely disappeared. The nature and origin of private penance is a subject of controversy between Catholics and Protestants; the former contending that it had existed from the first, and that it held the same place even in the age of public penance for secret sins which the public penance did for public offences. At all events, from the date of the cessation of the public discipline, it has existed universally in the Roman Church. The priest, in absolving the penitent, imposes upon him the obligation of bearing certain marks, undergoing certain works of mortification, or performing certain devotional exercises. These acts of the penitent are held to form an integral part of the sacrament of penance.

According to Protestants, penance has no countenance whatever from Scripture, and is contrary to some of the most essential principles of the Christian religion; particularly to the doctrine of justification by faith in Jesus Christ alone, on the ground of his complete or "finished" work; penance being, in fact, founded on a doctrine of—*at least*—supplementary atonement for the works or sufferings of man—the sinner—himself. The outward expressions of humiliation, sorrow, and repentance common under the Jewish dispensation, are regarded as very inconsistent with the character of that dispensation, in which so many symbols were employed. It is also held, that the self-inflicted scourges, as fasting, sackcloth, and ashes, &c., of Jewish and earliest Christian times, had for their sole purpose the mortification of unbelly lusts and sinful passions in the people of God; or the expression of sorrow for sin, so that others beholding might be warned of its evil and restrained from it, all which is perfectly consistent with the principles of Christianity, if kept within the limits of moderation and discretion. But penance is, by other view, as a *penitent exercise*, is utterly rejected. Arguments founded on the meaning of the two Greek words *metanoia* and *metamelantai*, both translated in our English version *repent*, are much urged by many Roman Catholic contraversarists—the former being represented as equivalent to the English *to Penance*; but this is contended by Protestants as inconsistent with the true use of the words in the New Testament itself. That penance began, as a practice, very early in the Christian church is justly admitted by Catholics, but alleged in proof of the very early growth of those corruptions which finally developed themselves in the doctrine and practice of the Roman Catholic Church, and of which Protestants too hold that there are plain intimations in the New Testament, not only prophetic, but showing

the development of their germs to have already begun during the age of the apostles.

In the discipline of the Protestant churches, penance is now unknown. The nearest approach to the Roman Catholic polity on the subject was that in use among the English Puritans of the 17th c., and more particularly in the Church of Scotland during that and the succeeding century, when it was common "to make satisfaction publicly on the Word of Repentance" (p. v.). It does not seem to have occurred to the followers of their more immediate successors in the Protestant churches, that their system of discipline, with its public rebukes and enforced humiliations of various kinds—such as wearing of a sackcloth robe, and sitting on a particular seat in church—was liable to be interpreted in a sense very different from that of a mere expression of sorrow for sin; but the belief is now very general among the most zealous adherents of their spiritual systems, that in all that they adopted practices inconsistent with their creed, and in harmony rather with that of the Church of Rome. Now do they seem to have perceived that Church Discipline (p. v.) in its proper sense, as relating to ecclesiastical rights and privileges, is wholly distinct from the imposition of penalties by churches or church courts. Penitential humiliations, imposed by ecclesiastical authority, are now no more in favour where church discipline is most strict, than where the utmost laxity prevails. The commutation of penalties deemed shameful, for a fine to the poor of the parish, was an abuse once prevalent in Scotland, but never sanctioned by the higher ecclesiastical authorities.

PENANG. See **PINIS-PENANG**.

PENANG LAWYERS, the commercial name for the stems of a species of palm imported from Penang for walking-sticks. They are small and hard, and have a portion of the root-stock attached, which is left to form the handle.

PENATES. See **LARES, MARES, and PENATES**.

PENCILS are instruments for writing, drawing, and painting, and they differ as much in their construction as in the uses to which they are applied. Probably the pencil was the first instrument used by artists, and consisted then of lumps of coloured earth or chalk simply cut into a form convenient for holding in the hand. With such pencils were executed the line-drawings of Arionides the Corinthian, and Telephosus the Sicilian, and also the early one-coloured pictures, or *monochromes*, of the Greeks and Egyptians; but as wet colours began to be used, small fine-pointed brushes would be required, and we find it recorded that as early as the 4th c. B.C., several Greek artists had rendered the art of painting with hair-pencils so famous, that some of their pictures sold for vast sums of money. There are now in use the following kinds of pencils: hair-pencils, black-lead pencils, chalk-pencils, and slate-pencils. The first are used for painting or writing with fluid colours, either oil or water, and in China and Japan are employed almost entirely instead of pens for writing; the colour used being the black or brown pigment obtained from various species of sepia or cuttle-fish. The manufacture of hair-pencils is of great importance, and requires much care and skill. The hairs employed are chiefly those of the camel, badger, sable, mink, kolinsky, fish, goat, and the bristles of hogs; and the art of pencil-making requires that these hairs shall be tied up in cylindrical bundles, so nicely arranged that all their naturally fine points shall be in one direction, and that the central one shall project the furthest, and the others in succession shall recede,

so that, collectively, the whole shall form a beautifully smooth cone, the apex of which is a sharp point. Black-lead pencils are made of graphite or plumbago, which contains no lead whatever in its composition, but is in reality almost pure carbon. See **BLACK-LEAD**. The misnomer is probably owing to the fact, that, previous to the employment of graphite for making pencils, common lead was used, and this was the case even within the present century. Consequently, as the plumbago, with its black streak, offered a contrast to the pale one of the lead, it was called in contradistinction *black-lead*.

The best graphite for drawing-pencils is found in the Cumberland mines, which have long been celebrated. Within the last three years, however, vast deposits of this mineral, of a very fine quality, have been discovered in Siberia and other parts of the Russian empire. Inferior qualities are found in Austria and Prussia, in Ceylon, and various parts of North America; but they are rarely used in pencil-making, except for very inferior kinds. Black-lead is rarely sufficiently free from sand and other foreign ingredients to be used without preparation; it is therefore generally ground fine, and levigated or washed until it is pure, and again formed into solid blocks by means of enormous pressure, generally in hydraulic presses; these blocks are then sawn into thin plates about the sixteenth of an inch in thickness, which are again cut across, so as to form them into small square sticks.

It may appear a very simple process to press the powdered graphite into blocks, but it was found so difficult in practice as almost to prevent the employment of this method, which has led to immense improvement in pencil-making. It was found at first that the difficulty of pressing out the contained air was so great that the presses were broken under the weight required; pressure in a vacuum was then tried, but the difficulty of applying it was found almost insurmountable, and it was certainly unprofitable. Mr Brokedon of London, who has long been famous for his pencils, at last surmounted the difficulty by an ingenious and very simple process. This consists in compressing the black-lead into blocks two or three inches square, with only moderate pressure; these are then coated over with paper, well glued, so that, when dry, the covering is air-tight. A small hole is now made through this coating on one side, and several of these cubes of black-lead are put under the receiver of an air-pump, and the air being exhausted completely from them, the orifice in each is closed by an adhesive wafer, which prevents the return of the air when they are taken out of the receiver. They are next placed under the hydraulic press, and a well-sustained and regular pressure is brought to bear upon them for twenty-four hours, after which they are found to be so completely consolidated, that in cutting them the substance is equal in density to the best specimens of unprepared graphite. There is so large a variation in the colour of various qualities of black-lead, that, by a judicious mixture of them, when in the powdered state, almost any shade of darkness can be procured; but instead of thus carefully combining different qualities of graphite, it is a common practice to add sulphur or sulphuret of antimony, and by heating to procure the desired degree of blackness. For very inferior pencils, the worst quality of black-lead is mixed with black chalk and size, or gum-water, and formed into a paste, of which the pencil is made.

It is usual to enclose the material constituting the essential part of the pencil in a case of wood, for

its protection from breakage, and to prevent its soiling the hands. The wood (generally cedar) is first sawn into thin boards, about half the thickness of the intended pencils; these are then cut into small pieces about ten inches long, by six in width, which are placed in the cutting and grooving machine. This machine consists principally of two circular saws—one very thin, and so set that it will cut through the board; the other revolving within the eighth of an inch of it, so set as only to cut a fine square groove in the wood. By means of this machine, the little boards are cut into straight square sticks, each having a groove on one surface. Into these grooves, the little prepared sticks of black-lead are laid and covered with a similar piece of wood, but not grooved. A workman, who is called the 'fastener-up,' having glued the inner faces of the two pieces of wood, presses them together, and sets them to dry; after which they are passed through the rounding-machine, dressed with a semi-circular smoothing-plane, cut at the ends, and then polished by rubbing them with a piece of shark-skin. The last process is stamping them with the maker's name and the letter which designates their peculiar quality. These letters are H, HH, HHH, B, BB, BBB, HB, FS. H signifies *hard*; repeated twice and thrice, it means *harder* and *very hard*. B means *black*, HB *hard and black*, and so on. FS signifies *fine stroke*.

Chalk-pencils are made in a similar manner, only that finely-powdered coloured chalks, such as are used for crayons, are substituted for the black-lead. Previous to pressing and cutting the chalk, it is mixed with a little hot melted wax, which gives it softness and adhesiveness.

Slate-pencils for writing on slate are made either by cutting slate into thin sticks, and rounding them; or by cutting it into fine square slips, and encasing them in wood, as in the case of black-lead, &c

PENDANT, or **PENNANT**, is a narrow flag of great length, tapering to a point, and carried at the head of the principal mast in a royal ship, to shew that she is in commission. In the British navy, the pendants are borne of three colours—red, white, or blue—according to the colour to which the admiral commanding the fleet pertains. See **FLAG-OFFICER**. A *broad-pennant* is a blue pennant, shorter and broader than the above, carried at the mast-head of a commodore's ship, to denote that her captain is the commodore on the station. A first-class commodore hoists his broad-pennant at the fore; if of the second-class, his flag flies at the mizzen.

The *rudder-pendants* are strong ropes spliced in the rings of the rudder-chain, to prevent the loss of the rudder, should it by any accident become unshipped.

PENDANT, a hanging ornament, used in ceilings, vaults, staircases, timber-rooms, &c. It is sometimes a simple ball, and sometimes elaborately ornamented, and is chiefly used in the later Gothic and Elizabethan styles

Pendant.

PENDENTIVE, the portion of a vault resting on one pier, and extending from the springing to the apex.—The word *pendentive* is also applied to

the portions of vaults introduced in the angles of rectangular compartments, in order to reduce them to a circular or other suitable form to receive a dome.

PENDLETON, a township of Lancashire, with a station on the Lancashire and Yorkshire Railway, is a suburb of Manchester, and is 24 miles west-north-west of the town of that name. In 1851, it contained 14,084 and in 1901, 20,000 inhabitants. Since then, the population has slightly increased. P. is part of the parliamentary borough of Radford, and since 1872 it has been incorporated with the municipality of the same borough. The rapid increase of its population is due to the immense industry of the locality. The occupations are employed in the numerous cotton and flax mills, print and dye-works, iron foundries, wire, and chemical works, in operation here. Hundreds of the population are also employed in the neighbourhood P. collieries, which are connected with much commerce by the railways. P. is also the nucleus of a section of the working-class community near Manchester, whose large numbers, with their mass and numbers, are dotted at intervals along the two roads leading from the township westward to Salford.

PENDULUM, in its widest scientific sense, denotes a body of any form or material which, under the action of some force, vibrates about a position of stable equilibrium. In its more usual application, however, this term is restricted, in conformity with its etymology (Lat. *pendo*, to hang), to bodies suspended from a point, or oscillating about an axis, under the action of gravity, so that, although the word of their motion are the same, Clocking Stones, *et c.* Magnetic Needles, Tuning-forks, Balance Wheel of a watch, *Am.*, are not included in the definition.

The simple pendulum consists (in theory) of a heavy point or particle, suspended by a flexible string without weight, and therefore constrained to move and to vibrate always on the inner surface of a smooth spherical bowl. If such a pendulum be drawn aside from a slightly inclined position, and allowed to fall back, it evidently will oscillate from side to side of its position of equilibrium, the motion being confined to a vertical plane. If, instead of being allowed to fall back, it be projected horizontally in a direction perpendicular to that in which gravity tends to move it, the bob will revolve about its lowest position; and there is a particular velocity with which, if it be projected, it describes a circle about that point, and is then called a *conical pendulum*. As the theory of the simple pendulum can be very easily explained, by reference to that of the conical pendulum, we commence with the latter, which is extremely simple. To find the requisite velocity, we have only to notice that the (so-called) Centrifugal Force (q. v.) must balance the tendency towards the vertical. This tendency is not directly due to gravity, but to the tension of the suspending cord. In the fig. let O be the point of suspension, Oa the pendulum in its lowest position, P the bob in any position in the (dotted)

circle which it describes when revolving as a conical pendulum: PO, a radius of the dotted circle, is evidently perpendicular to Oa. Now, the centrifugal force is directly as the radius PO of the circle, and inversely as the square of the time of revolution. Also the radius PB is PO sec. BOF, the length of the string multiplied by the sine of the angle it makes with the vertical; and the force towards the vertical is proportional to the earth's attraction, and to the tangent of the plane angle—as may be at once seen from the consideration that the three forces acting on the bob at P are parallel, and therefore proportional, to the sides of the triangle OBP. Hence the square of the time of revolution is directly as the length of the string and the sine of the angle BOF, and inversely as the earth's attraction and the tangent of the same angle; or (what is easily seen to be equivalent) to the length of the string and the cosine of its inclination to the vertical directly, and to the earth's attraction inversely. Hence, in any given locality, all conical pendulums revolve in equal times, whatever be the lengths of their strings, so long as they keep the same angle; the height being the product of the length of the string by the cosine of its inclination to the vertical. Also the squares of the times of revolution of conical pendulums are as their lengths directly, and as the earth's attraction inversely.

Now, as long as a conical pendulum is deflected only through a very small angle from the vertical, the motion at its bob may be considered as compounded of two equal simple pendulum oscillations in directions perpendicular to each other, such as it appears to make to an eye on a level with it and viewing it at some distance, first from one point, say on the north, and then from another 90° round, say on the east. And these motions take place, by Newton's second law (see *Motion*, *Laws*, *et c.*), independently. Also the time of a (double) oscillation in either of these directions is evidently the same as that of the rotation of the conical pendulum. Hence, for small arcs of vibration, the square of the time of oscillation of a simple pendulum is directly as its length, and inversely as the earth's attraction. Thus, the length of the second's pendulum at London being 39.1393 inches, that of the half-second's pendulum is 9.7848 inches, or one-fourth; that of the two seconds' pendulum 158.5579 inches, or four times that length. It follows from the principle now demonstrated, that so long as the arcs of vibration of a pendulum are all small relatively to the length of the string, they may differ considerably in length among themselves without differing appreciably in time. It is to this property of pendulum oscillations, known as *isochronism* (q. v.), that they owe their value in measuring time. See *Horology*.

That the times of vibration of different pendulums are as the square roots of their lengths, may be demonstrated to the eye by a very simple experiment. Suspend three metal balls on double threads as in the figure, so that the heights in the dotted line may be as 1, 4, and 9. When they are made to vibrate simultaneously, while the lowest ball makes one oscillation the highest will be found to make three, and the middle ball one and a half.

A pendulum of given length is a most delicate instrument for the measurement of the relative amounts of the earth's attraction at different

FIG. 1.

FIG. 2.

point of suspension, Oa the pendulum in its lowest position, P the bob in any position in the (dotted)

places. Practically, it gives the kinetic measurement of gravity, which is not only by far the most convenient, but also the true measure. By this application of the pendulum, the oblateness of the earth has been determined, in terms of the law of decrease of gravity from the poles to the equator. The instrument has also been employed to determine the mean density of the earth (from which its mass is directly derivable), by the observation of its times of vibration at the mouth and at the bottom of a coal-pit. It was shewn by Newton, that the force of attraction at the bottom of a pit depends only upon the internal nucleus which remains when a shell, everywhere of thickness equal to the depth of the pit, has been supposed to be removed from the whole surface of the earth. The latest observations by this method were made by Airy, the present astronomer-royal, in the Harton coal-pit, and gave for the mean density of the earth a result nearly equivalent to that deduced by Cavendish and Maskelyne from experiments of a totally different nature. See EARTH.

If the bob of the simple pendulum be slightly displaced in any manner, it describes an ellipse about its lowest position as centre. This ellipse may, of course, become a straight line or a circle, as in the cases already considered. The bob does not accurately describe the same curve in successive revolutions; in fact, the elliptic orbit just mentioned rotates in its own plane about its centre, in the same direction as the bob moves, with an angular velocity nearly proportional to the area of the ellipse. This is an interesting case of *progression of the apse* (Apsides, q. v.), which can be watched by any one who will attach a small bullet to a fine thread; or, still better, attach to the lower end of a long string fixed to the ceiling a funnel full of fine sand or ink which is allowed to escape from a small orifice. By this process, a more or less permanent trace of the motion of the pendulum is recorded, by which the elliptic form of the path and the phenomena of progression are well shewn.

According to what is stated above, there ought to be no progression if the pendulum could be made to vibrate simply in a straight line, as then the area of its elliptic orbit vanishes. It is, however, found to be almost impossible in practice to render the path absolutely straight; so that there always is from this cause a slight rate of change in the position of the line of oscillation. But as the direction of this change depends on the direction of rotation in the ellipse, it is as likely to affect the motion in one way as in the opposite, and is thus easily separable from the very curious result obtained by Foucault, that on account of the earth's rotation, the plane of vibration of the pendulum *appears to turn* in the same direction as the sun, that is, in the opposite direction to the earth's rotation about its axis. To illustrate this now well-known case, consider for a moment a simple pendulum vibrating at the *pole* of the earth. Here, if the pendulum vibrates in a straight line, the direction of that line remains absolutely fixed in space, while the earth turns round below it once in 24 hours. To a spectator on the earth, it appears, of course, as if the plane of motion of the pendulum were turning once round in 24 hours, but in the opposite direction. To find the amount of the corresponding phenomenon in any other latitude, all that is required is to know the rate of the earth's rotation about the vertical in that latitude. This is easy, for velocities of rotation are resolved and compounded by the same process as forces, hence the rate at which the earth rotates about the vertical in latitude λ is less than that of rotation about the polar axis in the ratio of $\sin. \lambda$

to 1. Hence the time of the apparent rotation of the plane of the pendulum's motion is $\frac{24 \text{ hours}}{\sin. \lambda}$. At

the pole, this is simply 24 hours; at the equator, it is infinitely great, or there is no effect of this kind; in the latitude of Edinburgh ($56^\circ 57' 23.2''$), it is 28.63 h., or 28 h. 37 m. 48 s.

We have not yet alluded to the obvious fact, that a *simple* pendulum, such as we have described above, exists in theory only, since we cannot procure either a single heavy particle, or a perfectly light and flexible string. But it is easily shewn, although the process cannot be given here, that a rigid body of any form whatever vibrates about an axis under the action of gravity, according to the same law as the hypothetical simple pendulum. The length of the equivalent simple pendulum depends upon what is called the Radius of Gyration (q. v.) of the pendulous body. Its property is simply this, that if the whole mass of the body were collected at a point whose distance from the axis is the radius of gyration, the moment (q. v.) of inertia of this heavy point (about the axis) would be the same as that of the complex body. The square of the radius of gyration of a body about any axis, is greater than the square of the radius of gyration about a parallel axis through the centre of gravity, by the square of the distance between those lines. Now, the length of the simple pendulum equivalent to a body oscillating about any axis is directly as the square of the radius of gyration, and inversely as the distance of the centre of gravity from the axis. Hence, if k be the radius of gyration of a body about an axis through the centre of gravity, $\sqrt{k^2 + h^2}$ is that about a parallel axis whose distance from the first is h ; and the length, l , of the equivalent simple pendulum is $l = \frac{k^2 + h^2}{h}$.

This expression becomes infinitely great if h be very large, and also if h be very small (that is, a body vibrates very slowly about an axis either far from, or near to, its centre of gravity). It must therefore have a minimum value. By solving the equation above as a quadratic in h , we find that h cannot be less than $2k$, which is, therefore, the length of the simple pendulum corresponding to the quickest vibrations which the body can execute about any axis parallel to the given one. In this case, the value of h is equal to k . Hence, if a circular cylinder be described in a body, its axis passing through the centre of gravity, and its radius being the radius of gyration about the axis, the times of oscillation about all generating lines of this cylinder are equal, and less than the times of oscillation about any other axes parallel to the given one. Also, since the formula for l , above given, may be thus written, $h(l - h) = k^2$, it is obvious that it is satisfied if $l - h$ be put for h . Hence, if any value l (of course not less than $2k$) be assigned as the length of the equivalent simple pendulum, there are *two* values of h which will satisfy the conditions; that is, there are two concentric cylinders, about a generating line of either of which the time of oscillation is that of the assigned simple pendulum. When $l = 2k$, these cylinders coincide, and form that above described. And, since the sum of the radii of these cylinders is l , it is obvious that if we can find experimentally two parallel axes about which a body oscillates in equal times, and if the centre of gravity of the body lie between these axes, and in their plane, the distance between these axes is the length of the equivalent simple pendulum. This result is of very great importance, because it enabled Kater (who was the first to employ it) to use the complex pendulum for the determination of the length of the simple

second's pendulum in any locality. The simple pendulum is perfect in theory, but cannot be constructed; and thus the method which enables us to obtain the results by the help of such a pendulum as we can construct is especially valuable.

Compensation Pendulum.—As the length of a rod or bar of any material depends on its temperature (see Hertz), a clock with an ordinary pendulum goes faster in cold, and slower in hot, weather. Various contrivances have been devised for the purpose of diminishing, if not destroying, these errors. The most perfect in theory, though perhaps not the most available in practice, is that of the H. thermostat, viz. founded upon the experimental discovery of Mitscherlich, that some crystals expand by heat in one direction, while contracting in the perpendicular one; and therefore that a rod may be cut out of the crystal in such a direction as not to alter in length by any change of temperature. In the method of correction usually employed, and called *compensation*, advantage is taken of the fact that different substances have different coefficients of linear dilatation; so that if the bar of the pendulum be so suspended as to be raised by the expansion of one substance, and depressed by the expansion of another, the lengths of the effective portions of these substances may be so adjusted that the raising and depression, taking place simultaneously, may leave the position of the bob unaffected. There are two common methods of effecting this differing a little in construction, but ultimately depending on the same principle. Of these, the *acrotical* pendulum is the more easily described.

The rod AC, and the framework CD, are of steel. Inside the framework is placed a cylindrical glass jar, nearly full of mercury, which can be raised or depressed by turning a nut at B. By increase of temperature, the steel portion AD is lengthened by an amount proportional to its length, its coefficient of linear dilatation, and the change of temperature, constantly—and thus the jar of mercury is removed from the axis of suspension. But neglecting the expansion of the glass, which is very small, the necessary rise in the jar by an amount proportional to the fall, its coefficient of cubical dilatation, and the change of temperature, constantly. Now, by increasing or diminishing the quantity of mercury, it is obvious that we may so adjust the instrument that the length ($\frac{L}{2}$) of the equivalent simple pendulum shall be unaltered by the change of temperature, whatever be its amount, so long as it is not great enough as to sensibly change the coefficients of dilatation of the two metals. The screw at B has nothing to do with the compensation, its use is to adjust the length of the pendulum so that it shall strike in true second.

The construction of the *gridiron* pendulum will be easily understood from the cut. The black bars are steel, the shaded ones are brass, copper, or some substance whose coefficient of linear dilatation is more than double that of steel. It is obvious from the figure that the horizontal bars are merely compensators, and that their expansion has nothing to do with the extension of the pendulum, so they may be made of any substance. It is easily seen that an increase of temperature lowers the bob by expanding the steel rods, whose effective length consists of the sum of the lengths of AD, BC, and the steel bar to which the bob is attached; while it raises the bob by expanding the brass bars, whose effective length is that of steel alone only; the other, as well

as the steel rod to, being added to the instrument for the sake of symmetry, strength, and stiffness only. If the effective lengths of steel and brass be inversely as their respective dilatation coefficients, the position of the bob is unaltered by temperature; and therefore the pendulum will vibrate in the same period as before heating. This is on the supposition that the weight of the framework may be neglected in comparison with that of the bob; if this weight must be taken into account, the requisite adjustment, though possible, are greatly more complex, and can only be alluded to here.

Practically, it is found that a strip of dry firwood, carefully varnished, to prevent the absorption of moisture, and consequent hygroscopic alterations of its length, is very little affected by change of temperature; and, in many excellent clocks, this is used as a very effective substitute for the more elaborate frame just described. To give an idea of the study which modern astronomy requires in the construction of an observing clock, we may mention that the Russian astronomers had the gridiron superior to the *acrotical* pendulum; because differences of temperature at different parts of the clock case (though almost imperceptible in a properly protected instrument), may heat the steel or the mercury mainly in the latter; while, in the former, the steel and brass bars run side by side through the greater part of the length of the pendulum, and are thus simultaneously affected by any such alterations of temperature.

It would lead us into details of a character far too abstract for the present work to treat of the effects of the hydrostatic pressure and viscosity of the air upon the motion of a pendulum.

PENELOPE, in Homeric legend, the wife of Ulysses (Odysseus), and mother of Telemachus, who was still an infant when Ulysses went to the Trojan war. During his long wanderings after the fall of Troy, he was generally regarded as dead, and P. was vexed by the urgent suits of many lovers, whom she put off on the pretext that she must first weave a shroud for Laertes, her aged father-in-law. To protract the time, she wove by night the portion of the web which she had woven by day. When the suitors had discovered this device, her position became more difficult than before; but fortunately Ulysses returned in time to rescue his chaste spouse from their distasteful importunities. Later tradition represents P. in a very different light, asserting that by Hermes (Mercury), or by all her suitors together, she became the mother of Pan (q. v.), and that Ulysses, on his return, discovered her in consequence. But the older Homeric legend is the simpler and more genuine version of the story.

PENGUIN (*Aptenodytes*), a genus of birds of the family *Alcidae* (see ALCA), or constituting the family *Aptenodytidae*, regarded by many as a sub-family of *Alcidae*, and divided into several genera or sub-genera. They have short wings, quite unfit for flight, but covered with short rigid scale-like feathers, admirably adapted for swimming, and much like the fingers of turtles. The legs are very short, and are placed very far back, so that on land penguins rest on the tarsus, which is widened like the sole of the foot of a quadruped, and maintain a perfectly erect posture. Their bones, unlike those of birds in general, are hard, compact, and heavy, and have no air-cavities; those of the extremities contain an oily marrow. The body is of an oblong

Fig. 1.

Fig. 2.

form; the neck of moderate length; the head small; the bill moderately long, straight, more or less compressed; the tail very short. Some of them have a long, slender, and pointed bill, the upper mandible a little curved at the tip, and

Penguin (*Aptenodytes pennatis*).

feathered for about a third of its length; some, sometimes called Gorfews or Gorfous (*Chrysocoma*) have a stout and pointed bill, a little curved at the tip; some, Sphenisques or Spheniscans (*Spheniscus*), have a straight and compressed bill, irregularly furrowed at the base. The Penguins are all among the most aquatic birds, although they are seldom seen very far out at sea; but it is only in the breeding season that they spend much time on shore. They are found only in the southern hemisphere, and chiefly in high southern latitudes, although some of the species extend into warm regions, as *Spheniscus Humboldtii* to the coast of Peru. Of this species, which is called *Pazaro niño*, or Child Bird, by the Peruvians, Tschudi states that it is easily tamed, becomes very sociable, and follows its master like a dog, waddling along in a very amusing manner with its plump body and short legs, keeping its balance by motions of its little wings. It displays considerable intelligence, and learns to answer to its name. In some of the furthest antarctic regions, penguins are prodigiously numerous, appearing on the shore like regiments of soldiers, or, according to another similitude which has been used by a voyager, like bands of little children in white aprons. They often occupy for their breeding ground a space of several acres, which is laid out and levelled and divided into squares, as nicely as if it had been done by a surveyor; whilst between the compartments they march as accurately as soldiers on parade. The KING P. (*A. Patagonica*), a large species, of the size of the great auk, dark grayish-blue above, white beneath, with a black head and a yellow curved band on the throat, is found in such numbers on some of the sandy antarctic coasts, that Mr Bennett describes one breeding ground on Macquarie Island as covering thirty or forty acres, and, to give some notion of the multitudes, speaks of 30,000 or 40,000 birds as continually landing and as many putting to sea. On many of the antarctic shores, the penguins do not flee from nor seem to dread the presence of man, remaining as if stupidly indifferent, even when their companions are knocked on the head; their very indifference, it is said, suggesting

the idea of loneliness and desolation more powerfully than if there were a total absence of life. When attacked, however, they often shew courage in self-defence, and are ready to run with open bill at an invader. The young are reckoned good eating; the old are said to be black and tough. The name P. is said to be derived from the Latin *pinguis*, fat.—Penguins make no nest, but lay a single egg in a chosen place on the shore; and the egg is carefully tended both by male and female. The female P. keeps charge of her young for nearly twelve months.—Many of the penguins are birds of bright plumage.—Cuttlefish, and other *Cephalopoda*, form a great part of their food. Their voice is loud and harsh, between a quack and a bray, but there are many diversities in the different species.

PENICILLARIA. See GUINEA CORN and MILLET.

PENITENTIAL PSALMS, seven of the Psalms of David, so called as being specially expressive of sorrow for sin, and accepted by Christian devotion as forms of prayer suitable for the repentant sinner. They are Psalms vi., xxxii., xxxviii., li., cli., cxxx., and cxliii. according to the Authorised Version, which correspond with vi., xxxi., xxxvii., l., cli., cxxix., and cxlii. of the Vulgate. These Psalms have been set apart from a very early period, and are referred to as such by Origen (Hom. ii. in Leviticum). Pope Innocent III. ordered that they should be recited in Lent. They have a special place in the Roman Breviary, and more than one of the popes attached an indulgence to the recital of them. The most deeply penitential, and the most frequent in use, both public and private, is the 51st Psalm, or the *Miserere* (50th in the Vulgate).

PENITENTIARIES, strictly so called, are institutions for the reception of penitent women, in which confinement is purely voluntary. The name has also been applied to prisons under the separate system, having been adopted by the Quakers of Pennsylvania in 1786, when they caused the legislature of that state to abolish the punishments of death, mutilation, and the whip, and to substitute solitary confinement as a reformatory process. Of penitentiaries, in the first sense, there are 63 in Great Britain and Ireland, capable of receiving 2657 inmates, besides numerous small private 'Homes.' The single condition of admission to most of the institutions is 'penitence,' a desire and endeavour to return to a virtuous life. The inmates remain in the strictest seclusion for periods varying from a few months to two years, the average time being about a year; they then return to their friends, or to situations provided for them. It is an invariable rule not to dismiss any one without seeing that she is provided with the means of honest subsistence. During their seclusion they are employed in needlework, washing, and housework. The ages at which they are received vary from 14 to 40. In the metropolis there are 19 institutions, accommodating 1155 women; in other towns of England, 34 institutions, accommodating 1116; and in the chief towns of Scotland and Ireland, 10 institutions, with accommodation for 386. One third of the provincial, and one half of the metropolitan establishments have been created in the last ten years. The oldest institution in existence is the London Magdalen Hospital, opened in 1758; the next, that of Dublin, 1767; Edinburgh follows in 1797; and none of the others date earlier than the present century. The results of these penitentiaries, as far as they can be ascertained, are excellent. During the last 100 years, 8983 women have passed through the London Magdalen, and the committees

case that they have found, from their extensive experience that 70 per cent. are permanently reformed. All the institutions can show a very large per-centage restored to their friends and to society.

PENITENTIARY (Lat. and Ital. *penitendarius*). A name given to one of the offices of the Roman court, and also to the dignitary is cardinal, called *penitentiarius* who presides over it. The cardinal penitentiary must be a priest and a doctor of divinity of canon law. He is named by the pope himself, and should the penitentiary die while the Roman see is vacant, the cardinal must be especially selected to elect by secret ballot a pro-penitentiary to act for the time. The officials of the penitentiary, under the cardinal penitentiary, are a council, three secretaries, three clerks, a corrector, a secretary in theology, and another in canon law, and one or two junior officers. The subjects which come under the office of the penitentiary are all matters relating to the confessional, especially the absolution from sins and from canonical censures, reserved to the pope, and in certain cases dispensations from the impediments of marriage.

PENN. WILLIAM, a celebrated English Quaker and philanthropist, the founder of the colony of Pennsylvania, was the son of Sir William Penn, an eminent English admiral, and was born at London, 14th October 1644. His early years were spent partly in France and partly in Ireland, where his father had several estates. P. studied at Christ Church, Oxford, and while here was converted to Quakerism by the preaching of a disciple of George Fox, named Thomas Lee. His enthusiasm for his new faith assumed a pugnacious form. Not only so he object personally to attend the services of the Church of England, and to wear the surplice of a student—both of which he considered unbefittingly papistical—but, along with some companions who had also become Quakers, he attacked several of his fellow students, and tore the obscene robes from their backs. For this unseemly procedure P. was expelled from the university. His father was so extremely annoyed at his conduct, that he gave P. a flogging, and turned him out of doors; but he soon afterwards mollified, and sent his son to live on the continent, in the hope that change of scene and the purity of French life would change the tone of his mind. They failed, however, to effect this, but the youth certainly acquired a grace and suavity of address that he did not before possess. In 1660 the admiral sent him to Ireland to look after his estates in the county of Cork, which yielded to his father's complete satisfaction; for in matters of business he was as practical an Englishman as in religion he was an out-and-out mystic. In the city of Cork, however, he again fell in with Thomas Lee, and for attending a Quaker meeting was, along with some others, imprisoned by the mayor, but was immediately afterwards released on appealing to the lord president of the Council of Munster, who was personally acquainted with him. On his return to England, P. and his father again quarrelled, because the 'conscience' of the former would not allow him to take off his hat to anybody—not even to the king, the Duke of York, or the eldest son of P.—P. was again turned out of doors by his father, but, fortunately, he was warmly protected by his mother, who, however, stepped in, and smoothed matters so far that P. was allowed to return home, and the discord even ceased his influence with the government to work at his son's attendance at the illegal convocations of the Quakers, which nothing would induce him to give up. In 1668, however, he was summoned to the Tower, on account of a publication

entitled *The Sandy Foundation Shaken*, in which he attacked the ordinary doctrines of the Trinity, God's satisfaction in the death of Christ, and justification by the imputation of Christ's righteousness. While in prison he wrote the most famous and popular of his books, *No Cross, no Crown*, and *Innocency with her Crown Penn*, a vindication of himself, which contributed to his liberation, which was obtained through the interference of the Duke of York. In September 1670, Admiral Penn died, leaving his son an estate of £1500 a year, together with claims upon government for £16,000. In 1671, the upright but incorruptible secretary was again committed to the Tower for preaching, and as he would not take an oath at his trial, he was sent to Newgate for six months. Here he wrote four treatises; one of them, entitled *The Great Cause of Liberty of Conscience* is an admirable defence of the doctrine of toleration. After regaining his liberty he visited Holland and Germany, along with Fox and Barclay, for the advancement of Quakerism. The Countess of Devon, daughter of James I., showed him particular favour. In his return he married, in the beginning of 1672, Elizabeth Maria Broughton, daughter of Sir William Springett, and for some years thereafter continued to propagate, by preaching and writing, the doctrines of his sect. Circumstances having turned his attention to the New World he, in 1681, obtained from the crown, in lieu of his monetary claim upon it, a grant of the territory now forming the state of Pennsylvania. P. wanted to call it *Sylvania*, on account of its forests; but the king (Charles II.) good-naturedly insisted on the prefix *Penn*. His great desire was to establish a home for his co-religionists in the distant West, where they might preach and practice their convictions in unobscured peace. P., with several friends, sailed for the Delaware in August 1682, was well received by the settlers, and on the 30th of November held his famous interview with the Indian tribes, under a large elm-tree at Shackamaxon, now Kensington. He next planned and named the city of Philadelphia, and for two years governed the colony in the wisest, most benevolent, and liberal manner. Not only Quakers, but persecuted members of other religious sects, sought refuge in his new colony, where, from the first, the principle of toleration was established by law. Having called the colonists together, he gave the infant state a constitution in twenty-four articles. Towards the end of the reign of Charles II., P. returned to England to exert himself in favour of his personal brethren at home. His influence with James II.—an old friend of his father's—was so great, that many people then, and some even yet, do not feel quite satisfied about the nature of their relations; but the suspicion that he allowed himself to be used as a tool by the court is really not justified by any known facts. It is possible, for his position was equivocal, but it is not proven, and Lord Macaulay—who has urged the view of his complicity in some of the disastrous incidents that followed Monmouth's rebellion, with an ungracious animosity—has been convicted of hate and insincerity in several important particulars. At any rate, his exertions in favour of the Quakers were so far successful, that in 1686 a proclamation was issued to release all persons imprisoned on account of their religious opinions, and more than 1200 Quakers were set free. In the April following, James issued an edict for the repeal of all religious tests and penalties, but the mass of Nonconformists mistrusted his sincerity, and refused to avail themselves of it. After the accession of the Prince of

Orange as William III., P. was twice accused of treason, and of corresponding with the exiled monarch, but was acquitted. In 1690 he was arrested on a charge of conspiracy, but was again acquitted. Nevertheless, in the following year, the charge was renewed. Nothing appears to have been done for some time, but P. at last, through the kindly offices of his friends, Locke, Tillotson, and others, had the matter thoroughly investigated, and he was finally and honourably acquitted, November 1693. Shortly after, his wife died, but in less than two years he married again. His second wife, Hannah Callowhill, was a Bristol lady. In 1699 he paid a second visit to the New World, and found Pennsylvania in a prosperous condition. His stay, which lasted two years, was marked by many useful measures, and by efforts to ameliorate the condition both of the Indians and Negroes. P. departed for England towards the end of 1701, leaving the management of his affairs to a Quaker agent named Ford, whose villany virtually ruined Penn. When the rogue died, he left to his widow and son false claims against his master, and these were so ruthlessly pressed, that P. allowed himself to be thrown into the Fleet in 1708, to avoid extortion. His friends afterwards procured his release, but not till his constitution was fatally impaired. P. died at Ruscombe, in Berkshire, July 30, 1718. He left issue by both marriages. Upon the P. controversy it is unnecessary further to enter. We refer our readers to Macaulay's *History of England* (1849—1855); Heyworth Dixon's *Life of Penn* (new edit. 1856); J. Paget's *Inquiry into the Evidence of the Charges brought by Lord Macaulay against William Penn* (Edin. 1858).

PENNALISM, the name given to a practice once prevalent in the Protestant universities of Germany, which seems to have been essentially the same as the Fagging (q. v.) of the English public schools. The freshmen or students of the first year (called *pennals*—i. e., *pen-canes*; fags) were considered by the elder students ('schorists') as virtually their servants. Whatever property the pennals had they must give up to the schorists, who now employed them in the meanest offices, made laughing-stocks of them, and beat and ill-used them—all which had to be endured without complaint. After a year of this discipline followed the ceremony of 'deposition'—a practice older than pennalism itself, and borrowed probably from knightly consecration—in which the pennal underwent a number of symbolical trials, indicative generally of purgation from impurity and consecration to an intellectual life. Pennalism is said to have been introduced in the beginning of the 17th c., and to have been mostly confined to the Protestant universities of Germany. But although the full development of the system may have been thus restricted, germs and modifications of it were much earlier and more general, as is manifest from the prevalence of names of contempt for first year's students (see BEJAN), and from statutes passed by French universities as early as the middle of the 14th c., against levying payments for first footing from them. See also FAGGING. The servitude imposed on the pennals was probably an aping of the usage of chivalry, by which a candidate for knighthood had to serve for a time as page to one already a knight. All attempts to check the evils of pennalism were long unavailing, as the pennals took part with the schorists in resisting all regulations of the authorities, which would have deprived them of the hope of exercising in their turn a like tyranny upon others. Edicts against the practice were issued in Jena and other universities about the beginning of

the 17th c., but it was not till the last half of the century that the universities, by uniting in severe measures, were able to check the evil; and traces of it survived for a long time afterwards. In imitation of the students, a kind of pennalism was adopted by other bodies, more particularly by the printers, who retained the ceremony of 'deposition' after it had disappeared from the universities.—Schöttgen, *Historie des Pennalwesens* (Dresd. 1747).

PENNANT, THOMAS, LL.D., tourist, naturalist, and antiquary, was born June 14, 1726, at Downing, in Flintshire, and educated at Queen's and Oriel Colleges, Oxford. His first important publication was the *British Zoology* (1761—1769), which contained in all 132 plates on imperial paper, engraved by Mazel, and established his reputation. While the work was in course of publication, P. made a trip to the continent, and saw some of the scientific and literary celebrities of the time, as Buffon, who has favourably mentioned him in his great work on *Natural History*, Voltaire, Haller, the two Geauers, and Pallas. In 1769, he made the first of his famous tours in Scotland, penetrating to the remotest part of the country, which, he says, was then 'almost as little known as Kamtschatka.' He returned with a very good opinion of it, and published his report in 1771, in consequence of which (according to him) Scotland has 'ever since been inondée with southern visitants.' The year before, he added 103 plates to his *British Zoology*, with descriptive notices; and in 1771, printed at Chester his *Synopsis of Quadrupeds*, subsequently enlarged and improved under the title of *History of Quadrupeds*. Of this work Cuvier says: 'It is still indispensable to those who wish to study the history of quadrupeds.' In the same year the university of Oxford conferred on him the degree of LL.D. Next year he undertook his second and most important tour in Scotland, which included a voyage to the Hebrides (an account of which appeared in 3 vols. 1775). P. was warmly welcomed by the inhabitants. Almost every incorporated town paid him some formal compliment, and he returned 'rich in civic honour.' In 1773, he published his *Genera of Birds*, and made an antiquarian tour through the north of England. His subsequent tours through Wales do not require special notice. In 1777 appeared a fourth volume of his *British Zoology*, containing the Vermes, the Crustaceous and the Testaceous Animals of the Country. Among a great variety of later miscellaneous publications, we may mention in particular an amusing life of himself (*The Literary Life of the late Thomas Pennant, Esq., by himself*, 1793). He died December 16, 1798.

PENNA-TULA, a genus of zoophytes (*Anthozoa*), allied to *Gorgonia* (q. v.) and *Alcyonium* (q. v.), and having very similar polypes; but the polype mass is not fixed by its base, has a fleshy stem strengthened by a bone, and a skin containing calcareous spicules, the upper part of the stem winged on two sides, with numerous pinnae along the upper margins of which the polype-cells are ranged. The whole form somewhat resembles a quill, so that the popular name SEA PEN is very often given to these zoophytes. One species, *P. phosphorea*, is common on the northern parts of the British coast. It is from two to four inches in length, of a purplish-red colour, and like many—perhaps all—of the other species, is sometimes brilliantly phosphorescent, emitting flashes of light when disturbed, but ceasing to be luminous on relapsing into quiescence. The stalk is hollow in the centre, and the bone which it contains—and which is composed of phosphate and carbonate of lime, like the bones of the vertebrate animals—is a very remarkable part of its

PENNON—PENNY.

structure, not extending the whole length of the stalk, slender, straight, and perfectly simple, but bent backwards at each end into a hook. Other species are found in the Mediterranean and other seas, some of them more pen-like than even the

Pennatula (*Virgularia mirabilis*).

British one. It has been alleged that they swim by contractions and dilatations of their common fleshy substance, or by movements of the pinnae; but there is no good evidence of their possessing any such power of locomotion, which is very contrary to the analogy of all similar zoophytes, and more probably the opinion prevalent among the fishermen of the Scottish coasts is the correct one, that their natural place is at the bottom of the sea, with the somewhat flexible lower end of the stalk immersed in mud. Nearly allied to the pennatulæ is another genus of extremely beautiful zoophytes, *Virgularia*, ranked with them in the family *Pennatulidæ*, and sometimes receiving the popular name

SEA RUSH. One species, *V. mirabilis*, is found on the British coasts. It resembles a slender rod, bearing throughout the greater part of its length two rows of lobes, along the margin of which the polypes are arranged. The whole length is from six to ten inches.

Pennon.

for the charge. The accompanying example is from the brass to Sir John D'Aubernoun at Stoke Daubernon, Surrey; it is azure, charged with a chevron and fringed gules.

PENNONCELLE, a long streamer-like flag, the diminutive of the Pennon (q. v.).

PENNSYLVANIA, one of the thirteen original United States of America, now the second in population, and called from its position and importance 'the Keystone State,' is in lat. 39° 43'—42° 15' N., long. 74° 75'—80° 37' W. It is bounded N. by Lake Erie and New York; E. by New York and New Jersey, from which it is separated by the Delaware River; S. by Maryland and Virginia; and W. by Virginia and Ohio. The small state of Delaware borders for a few miles on its south-eastern angle. The form is very regular, the boundaries of three sides being lines of latitude and longitude. It is 310 miles long, 160 wide, containing an area of 46,000 square miles, or 29,440,000 acres, divided into 66 counties. The state is divided near the middle by the Alleghanies into an eastern region, whose

waters fall into the Delaware and Chesapeake Bays, and a western, in which the principal rivers are the Alleghany, the Monongahela, and other important affluents of the Ohio. These, with the Delaware and Susquehanna, Lehigh, Schuylkill, and Juniatta, are the principal rivers. The chief towns are Philadelphia, on its south-eastern border; Pittsburgh, at the head of the Ohio; and Harrisburgh, the capital, on the Susquehanna. The Blue Ridge, which enters the south-eastern portion of the state, rises to the height of 1500 feet; the passes of the Alleghanies are 2000 feet high, and single peaks 3000 feet. Lake Erie is 650 feet above the ocean. The geological formations range from the Potsdam sandstone to the coal-measures. There is middle secondary red sandstone and drift in the north-east; gneiss and red sandstone in the south-east; the centre of the state is a rich and fertile limestone valley. Near Philadelphia are fine quarries of white marble. The great anthracite and semi-anthracite deposits of coal are east of the Alleghanies; west are the great beds of bituminous coal, which largely supply the Mississippi valley. Salt is found beneath the coal, and in the bituminous districts great deposits of petroleum. Adjacent to the coal-measures are rich beds of iron ore, also lead, copper, nickel, and chrome ores. The climate is mild, and the soil fertile, producing abundance of wheat, Indian corn, oats, rye, buckwheat, potatoes, flax, hemp, tobacco, hay and pastureage, with apples, pears, peaches, grapes, &c. While one of the best agricultural states, P. has also a large industry engaged in mines and manufactures, coal, iron, woollen, and cotton. The state has more than 3000 miles of railways, 1030 of canals, 26 colleges, 8 schools of medicine, 20 state academies, 335 public schools, having 14,000 teachers and 647,414 pupils, 4000 churches, 400 public and school libraries, 310 periodicals—of which 27 are daily papers, and 71 literary publications—2 state penitentiaries at Philadelphia and Pittsburg on the solitary system, asylums for insane, blind, &c., Girard College for orphan boys. In 1627 a colony of Swedes and Finns settled on the river Delaware. In 1681 the territory was granted by Charles II. to William Penn, who, by the industry of his co-religionists, the Society of Friends, by cultivating peace with the Indians and encouraging emigration, founded a rich and flourishing state. It was the scene of Braddock's defeat in the French war; and in the revolution of 1776, Philadelphia was the chief city and capital of the Federation, near which were the actions of Germantown, Brandywine, &c. The population, largely Scottish and German in its origin, was in 1800, 602,361; 1820, 1,049,453; 1840, 1,724,033; 1860, 2,906,370.

PENNY, a British coin and money of account. After the Sceattæ (q. v.) it is the most ancient of the English coins, and was the only one generally current among the Anglo-Saxons. The name is evidently the same as the German *penny*, and both words seem to be intimately connected with the old German *pfant*, a pledge, and the Latin *pendo*, to weigh or to pay. Both in Britain and on the continent the word was anciently used for money in general, hence we have such phrases as, 'he has got his penny-worth,' i. e., he has got value for his money, &c. The penny is first mentioned in the laws of Ina, king of the West Saxons, about the close of the 7th century. It was at this time a silver coin, and weighed about 22½ troy grains, being thus about 1/24th of the Saxon pound-weight. This relation to the pound-weight is evidently derived from the usage of the early Franks, who retained the Roman division of the *libra* into 20 *solidi*, and the *solidus* into 12 *denarii*

PENNYROYAL—PENSIONS AND PENSIONERS.

(the denarius being thus the 240th part of the libra or pound. See MARK. Halfpence and farthings were not coined in England till the time of Edward I., but the practice previously prevailed of so deeply indenting the penny with a cross mark, that the coin could be easily broken into two or four parts as required. Silver farthings ceased to be coined under Edward VI., and silver halfpennies under the Commonwealth. By this time the penny had steadily decreased in weight; it was 18 grains under Edward III., 15 and 12 under Edward IV., 8 under Edward VI., and under Elizabeth it was finally fixed at $7\frac{1}{2}$ grains, or $\frac{1}{4}$ of an ounce of silver, a value to which the subsequent copper pennies, which till 1860 were the circulating medium, closely approximated. In 1672 an authorised copper coinage was established, and halfpence and farthings were struck in copper. The penny was not introduced till 1797, and at the same period the coinage of twopenny pieces was begun; but these latter, being found unsuitable, were withdrawn. The penny of the present bronze coinage is of only about half the value of the old copper penny. The German *pfennig* was also originally a silver coin, bearing the same relation to the German pound of silver as the English penny to its pound. And in the 12th c. it was made so broad, in imitation of the Byzantine coins, that it would no longer bear to be struck with a die on each side as before, but was struck on one side only. In the beginning of the 14th c. the mark of silver was anew divided into 60 parts or coins, which, to distinguish them from the old coins, were called *grossi denarii*, whence the term *groschen*. In the modern money system of Prussia, the pfennig is a copper coin, the twelfth part of a groschen.

PENNYROY'AL, a species of Mint (q. v.). The name P. is given in North America to a small plant, *Hedeosma pulegioides*, allied to the mints, and having,

Pennyroyal.

like them, a pleasant aromatic smell, and a warm pungent taste; which is much in use in domestic medicine, in the form of a warm infusion, to promote perspiration and as an emmenagogue.

PENNY WEDDINGS, or **PENNY BRIDALS**, was the name given to festive marriage ceremonials

in Scotland, at which the invited guests made contributions in money (seldom more than 1s. each), to pay the general expenses, and leave over a small sum, which would assist the newly-married pair in furnishing their dwelling. This practice, now disused, was prevalent in the 17th c.; and, as leading to 'profane minstrelsing and promiscuous dancing,' was denounced by an Act of the General Assembly of the Kirk, 1645, as well as by numerous acts of presbyteries and kirk-sessions about the same period.

PENOBSCOT, a river of Maine, U.S., rises near the centre of the state by two branches, from a chain of lakes extending north-westerly; and after a south by west course of 135 miles from the junction, or 275 in all, empties into Penobscot Bay, a broad and sheltered opening into the Atlantic Ocean, 20 miles wide, with several large islands. Its chief towns are Belfast, at its mouth; Bangor, 50 miles above, where falls supply power to saw-mills and factories; Castine, and Bucksport. It is navigable to Bangor, where there is a tide of 20 feet. The chief trade is pine timber.

PEN'RITH, a market town of Cumberland, in a picturesque and fertile valley, with rich and striking scenery in the vicinity, stands on the Carlisle and Lancaster Railway, 17 miles south-south-east of Carlisle. In the parish churchyard is a monument of great antiquity, formed of two pyramidal stones about 12 feet high, and known as the 'Giant's Grave.' The town contains an ancient free grammar-school, and other educational institutions. A new and beautiful church, built in the style of the 13th c., was consecrated here in 1850. Cotton, linen, and woollen goods are manufactured. Pop. (1861) 7189.

PENRY'N, a municipal and parliamentary borough and market town of England, in the county of Cornwall, in a warm, sheltered, and richly productive valley, on the Plymouth and Falmouth Railway, two miles west-north-west of Falmouth. It stands on a low hill projecting eastward into Falmouth Harbour. Trade is carried on to some extent with the mining district of Redruth, and there are several quarries in the vicinity, from which the famous P. granite—the material of which Waterloo Bridge, the Chatham Docks, and a great number of other important public works are constructed—is obtained: 20,000 tons of granite have been exported in the year, but the quantity varies much. Pop. (1861) of municipal borough, 3547. Together with Falmouth, it forms a parliamentary borough, which returns two members to parliament, and the population of which, in 1861, was 14,485.

PENSACO'LA, a town and port of entry, on a deep bay opening into the Gulf of Mexico, at the south-western extremity of West Florida, U.S. Lat. 30° 24' N., long. 87° 10' W. The town, nearly destroyed during the war of 1861, is on the north shore of the bay, and is connected by railway with Montgomery, Alabama. Near the entrance were the navy yard, hospital, and Fort Barrancas. The entrance is further defended by Fort Pickens, at the west end of Santa Rosa Island, and Fort M'Rae on the opposite point. The bay branches into two divisions, receiving the Escambia and Yellow Rivers. As one of the best harbours on the gulf, P. was settled by the Spaniards, occupied by the British in 1814, and acquired by the United States in 1821.

PENSION (Lat. *pensio*, from *pendo*, to weigh out, to pay), an allowance paid annually by government to an individual in consideration of past services, civil or military. See CIVIL LIST.

PENSIONS AND PENSIONERS, MILITARY AND NAVAL. There are pensions for good service,

PENSIONERS AND PENSIONERS - PENTACHINUS

for more faithful ordinary service, for wounds, and for representatives of deceased officers.

Land Service Pensions are awarded to selected officers in the British army for distinguished service. In 1904 they are as follows: 1 admirals have £200 each, 21 captains £100, 1 general of divisions £200, 3 colonels £100, and 3 medical officers £100; the total charge being £20,100. The corresponding pension in the army is called a *Dawson for Distinguished Service* (q. v.).

The *Pensions for Long Service* are awarded to the army to non-commissioned officers and soldiers who have served 21 years in the infantry, or 24 years in the cavalry, or earlier if disabled from further service, according to the wounds, loss of health, and conduct of the pensioner. The amount is fixed by the committee of Chelsea Hospital, and varies from 14s. to 1s. 6d. a day, the lower rates being mainly awarded to those pensioners from the West India regiments. Pensioners are either pensioners of Chelsea (q. v.) or Kilmainham Hospital, in which case they forget their proper pension, and receive board, lodging, and a small sum for tobacco-money, or out-pensioners residing where they please, and drawing their pensions from the staff officers of pensioners, of whom there is one in every considerable unit. These men may follow other pursuits, often do so with great success, as their military habits of regularity stand them in good stead in civil life. In particular, railways give employment to great numbers of pensioners, as signalmen, guards, &c. Pensioners who are in good health, and are willing for such service, are enrolled in a force called the "Smallest Pensioners," which forms a defensive corps of veterans. This gives the man, as an adjunct to the pension, an annual gratuity of £1 each, besides pay during the yearly training, of 5 days at the rate of 2s. a day for privates, 2s. 6d. for corporals, and 3s. for sergeants. The veterans are officered by their respective staff officers, and, in case of emergency, would be called for service. As garrison forces, these old soldiers would doubtless prove most valuable. A pension is forfeited if the holder is convicted of felony. The number of pensioners in 1904 is 61,317, and their pensions amount to £1,141,108. These are exclusive of 558 in-pensioners at Chelsea, and about 100 of Kilmainham; the rest at these establishments together being 273,950. The cost of the enrolled pensioners is £40,000 in salaries, and that of the 1500 men composing the army of reserve (see Reserve) £10,000 more.

The *Naval Pensions for Long Service* are given to petty officers, seamen, and marines; under principles essentially similar to those for the army; the commissioners of Greenwich Hospital awarding the pensions, Greenwich Hospital being the home of the pensioners, and the out-pensioners drawing their pensions through the staff officers of military pensioners. In 1904, 7163 petty officers and seamen, and 2301 marines receive pensions, producing a total of £224,082, 11s.

Under this section should be mentioned pensions for special services in action, granted with the Victoria Cross (q. v.).

Pensions for wounds are common to both services, and are limited to officers. They are awarded collectively by the Secretary for War and Lords of the Admiralty, for serious bodily injury, as the loss of a limb or eye, and vary according to the rank of the recipient and other circumstances. In cases of less serious injury, temporary pensions are sometimes granted, or gratuities. The charge for pensions for wounds for 1904 is: army, £20 per pensioner, £28,021; navy, 600 pensioners, £28,800; total, £56,821. In the case of wounded soldiers and sailors, wounds pay more in honor or argument the pension for

service (see above); but they have no distinctive pension for wounds.

Widows of commissioned and warrant officers in the army and navy receive pensions so long as they remain unmarried, provided they have been married severally twelve months when their husbands die, and that the latter were under 60 years of age (50 for warrant officers) when they started the claimants. Such pension is not granted if the widow be left in wealthy circumstances, and the demand during a second marriage, though it may be reversed should she again become a widow. The amount of pension varies according to rank, and there are three distinct classes for each rank: 1st, When the husband was killed in battle, or died within six months of wounds received in battle; 2d, When he died from some cause distinctly falling within the sphere of his duty, but not from wounds in action; 3d, When he died in the course of nature. The following table shows the amount of pension to widows of non-combatant ranks, civil ranks receiving similar rates according to relative standing. See Relative Rank.

Widow of	Per Annum.		
	For Class.	2d Class.	3d Class.
Flag Officer, or General Officer,	According to circumstances.	£120	
Captains in Navy, Colonels in Army,	£200	£100 (Class 1st)	60 & 50
Lieutenants-Colonels in Army,	200	100	50
Commanders in Navy, Majors in Army,	100	100	50
Lieutenants, Navy, Captains, Army,	50	50	50
Sub-Lieutenants, Navy, Lieutenants, Army,	50	50	50
Indians, Army,	50	50	50
Generals, India Office,	50	50	50
Colonels, Navy,	50	50	50

Compassionate allowances are small additional pensions granted to the children of deceased officers, left in indigent or bad circumstances. They vary from £5 to £40 each, and can be held by boys till 15 (unless earlier provided for), and by girls until 21, or an earlier marriage. If an officer fall in action, without leaving a widow or orphans, but leaving a parent who had been more or less dependent on him, such parent may be granted the pension or a portion of it, and is sometimes allowed to commute the pension into a single payment. In very special cases, the estate of an officer, who had been more or less dependent on him, are granted compassionate allowances. The cost of widows', &c., pensions for 1904 stand as follows:

Army—Pensions to 2220 widows,	£375,017
Compassionate allowances to 1107 orphans,	12,163
Naval family allowances to 215 widows, mothers, and children, and relief fund,	25,021
	£412,201
Navy—Pensions to 2519 widows,	£193,474
Compassionate allowances to 1107 orphans,	12,163
	£205,637

PENSIONARY, GRAND, OF HOLLAND. See GRAND PENSIONARY.

PENTACHINUS, a genus of *Echinodermata*, of the order of family *Crinoidae* (q. v.), remarkable as containing the only permanently stalked Crinoides, or Crinoides believed to be permanently stalked, known now to exist, and thus the only true living representative of the fossil *Encrinurus* (q. v.). The genus *P.* has a long pentagonal column of numerous

joints, from which there arise at intervals many whorls of unbranched arms, and which bears at its summit a disc at first divided into five radiating members, and afterwards branching into ten arms, each further subdivided. The whole of this skeleton is calcareous, but it is united by cartilages, and covered with a fleshy integument. *P. Caput Medusæ*, the MEDUSA'S HEAD, is found in the West Indian seas, and is very rare in collections, being only dredged up from waters of considerable depth; from which cause also the nature of the base of the column is not certainly known. The stem is more than a foot long.—The fossil species of *P.* are numerous in the Lias and Oolite formations. They gradually become fewer in the newer rocks.—The stalked young of *Comatula roseacea* was at one time regarded as a *P.*, and described under the name of *P. Europæus*. See CRINOIDEÆ.

PENTADESMA, a genus of trees of the natural order *Guttifera*, to which belongs the BUTTER-AND-TALLOW TREE of Sierra Leone, *P. butyracea*. It is a tree sixty feet high, and produces a conical fruit of the size of a very large pear, the pulp of which abounds in a yellow oily substance, with a strong flavour, somewhat resembling that of turpentine, yet much used by the natives as an article of food. The 'country butter,' brought to the market of Freetown, is supposed to be procured from this fruit.

PENTASTYLE, a building with a portico of five columns.

PENTATEUCH (Gr. fivefold book), a name given by Greek translators to the five books ascribed to Moses, which are in Hebrew called collectively *Torah* (Law), by way of eminence, or *Chamisha Chumshe Torah* (five-fifths of the Torah). *Law* is also the general name by which the work or portions of it are referred to and quoted (the words 'of Moses' or 'of the Lord' being added occasionally) both in the Old and New Testament.

The division into five portions (further divided into 50, 40, 27, 36, 34 chapters, or 12, 11, 10, 10, 11 Parshioth or Sidras respectively, by the Masoretes) is, if not original, at all events of a very remote date, and certainly anterior to the Septuagint. Genesis, Leviticus, and Deuteronomy, the first, third, and fifth books, form clearly defined and internally complete parts of the work as a whole, and thus, also, fix the limits of the intermediate second (Exodus) and the commencement of the concluding fifth (Deuteronomy). The chief aim of the Pentateuch being to give a description of the origin and history of the Hebrew people up to the conquest of Canaan, together with the theocracy founded among them, the centre is formed by the person of Moses himself, the regenerator and lawgiver of the nation. Genesis, beginning with the history of the creation and antediluvian genealogy from Adam to Noah, in rapid outlines sketches the propagation of the various tribes that descended from the one man who was saved in the Deluge, but dwells with special emphasis upon Shem, from whom sprang, in the tenth generation, Abraham, the progenitor of the 'people of the covenant.' The salient events in the lives of his descendants, the Patriarchs, are minutely described; and a fitting close is found in the benediction of Jacob, who, as it were, reinaugurates and confirms all his twelve sons in the covenant made between Abraham and God. Exodus, treating of the liberation of the people from Egypt; their wanderings in the desert; the promulgation of the Law, by which they became emphatically the 'holy nation' and the 'people of the Lord;' and the erection of a visible sanctuary; may be regarded as the nucleus of

the work; while Leviticus, the following book, fittingly enters into the details of the legislation and the mode of worship; chiefly concerning the priests and Levites, the expositors of the Law, and, in a manner, the spiritual representatives of the other tribes. The historical thread is taken up again in Numbers, the fourth book, which, also, side by side with the relation of the events between the Sinaitic period and the beginning of the fortieth year after the Exodus, contains many laws explanatory of, or complementary to, those of the former books, together with such as new circumstances had called into existence. A brief recapitulation of the preceding portions; Moses's most impressive and reiterated exhortations to keep that Law, which was now completed, and solemnly transmitted to the Levites; and the death of the legislator himself; form the chief contents of the fifth book, or Deuteronomy. Thus, the theocratic plan of the work is carried through from beginning to end, coming out more prominently in the three intermediate books, but never lost sight of entirely. Nothing is dwelt or even touched upon save that which in some way illustrates either the relation of God to the people, or of the people to God; the political, civil, and domestic laws themselves, being enumerated only as bearing upon the main aim and object of the work.

The special books being treated separately under their respective heads, we have here only to consider some questions relating to the work as a whole, and principally that of its authorship and history, as far as these points have not been touched upon already under GENESIS. Tradition, as embodied in the earliest historical records, mentions Moses as the writer of the complete Pentateuch, such as it is before us: with the exception of a few verses, describing the last moments of the lawgiver, &c., which were ascribed to Joshua. This tradition has for many a long century been almost universally adhered to. Not that there have not at different periods suspicions been raised respecting this 'authenticity.' The Pseudo-Clementines, for instance, assumed that the Law, orally delivered by Moses to the Elders, had, before and after its being committed to writing, undergone innumerable changes, nay, corruptions; among these the too personal and human conceptions of God, and the unworthy traits recorded of the Patriarchs. Jerome expresses himself in a somewhat doubtful manner on the relation of Ezra as the 'redactor,' or rather 'restorer,' of the Pentateuch. Aben Ezra boldly calls several passages later interpolations, and speaks of others still more poignantly as a *Saad*, or a 'Mystery,' i. e., as containing difficulties not to be cleared away in consonance with the common belief, which he, however, was too pious wantonly to disturb. Other voices, vaguely lifted up by more or less competent scholars, remained unheard. It was not until long after the Reformation, at the dawn of the exegetical and critical modern age, that the question whether this codex was the work of one man, or even of one age, and what share, if any, Moses had in its composition, began to be discussed seriously and on scientific grounds. Hobbes held that the Pentateuch was rather a work on, than by Moses. Spinoza came to the conclusion, that it was to Ezra that we were indebted for the book in its present shape, and that it embodies certain genuine portions, collected at a late period, together with a vast amount of later material, added at various periods subsequent to the time of the supposed author. Vitrings, Le Clerc (Clericus), Rich., Simon, and others, followed, resuming and enlarging the discussion chiefly respecting the difficulties which presented themselves in the accounts of the creation, and the like, contained

in Genesis. The next, and indeed the most important step—because the one which at once removed the question from the field of hazy and timid speculations to that scientific basis upon which it still rests, was taken by Astruc, who, from the marked difference of the Divine names used in Genesis and the beginning of Exodus—noticed in the TALMUD and the FATHERS OF THE CHURCH—came to the conclusion, that these books had been worked up from different original documents, which he called Jehovistic and Elohistie respectively. See article GENESIS, where the development of this speculation is described. At the present stage of the investigation, the view very generally adopted is the 'complementary theory,' which assumes, with certainty, two or more authors—Jehovists and Elohistie—for the whole of the first four books, at least; the fifth being by some (Delitzsch, Schulz, Kurz, &c.) still ascribed chiefly to Moses's own hand. Only a small apologetic school, of which the chief spokesman is Hengstenberg, still upholds the entire integrity and authenticity of the work, pronouncing Moses its sole author. The contemporary discussions on these points, which, up to within a very recent period, were chiefly confined to Germany, have now also found their way into England. The impulse to the controversy in this country was principally given by Dr Davidson, the 'Essayists and Reviewers,' and Bishop Colenso, all of whom, on the basis of these German investigations, raised some new points. Innumerable replies, by more or less competent champions, have been issued; but as yet, so far from either of the combatants having declared themselves convinced by the arguments from the other side, the controversy elicits new publications uninterruptedly.

While endeavouring to trace, in the briefest of outlines, some of the chief objections raised against the Mosaic authorship, and the replies given thereto, we must remind the reader that ours is only the task of epitomisers, as it were, and that the very nature of our task precludes us from giving any opinion whatsoever about the superior force of the arguments on either side.

A work, alleged to be the production of one man, it is urged, first of all, ought to contain neither unnecessary repetitions of considerable length, nor contradictions, nor anachronisms. There ought to be a plan and a unity. Yet, there can be no doubt, they say, about the fragmentary character of the Pentateuch. Many portions, evidently complete in themselves, are strung together without the slightest logical sequence, nay, in an unchronological order. As to repetitions and contradictions, there is, to begin with, the very history of the creation, which occurs twice in the first chapters of Genesis, is each time given differently, and in each account the Divine name is consistently mentioned in a different way. The same is to be said with regard to the account of the Deluge, and several incidents in the lives of the Patriarchs; the important conversation between God and Moses respecting Aaron (Exod. iv. 10—16, and vi. 9); the descriptions of the tabernacle; the priestly vestments; the story of the manna as given in Exodus and Numbers; the account of the appointment of the council of the 70 elders in the same books; &c. Again, the work itself sometimes seems to indicate an author who is not the legislator himself, such as the phrase of Moses being the humblest of men; the account of his own death; the passage in Genesis 'before there reigned any king over the children of Israel' (xxxvi. 31); the occurrence of the name of the city of Dan (Gen. xiv. 14, Deut. xxxiv. 1), so called only after the conquest by that tribe. In Numb. xxxii. 34, again, we have an enumeration of a certain

number of towns and villages built by the tribes of Gad and Reuben—an event which could not have happened during Moses's lifetime; further, the frequent occurrence of the formula 'unto this day' (e. g., Deut. x. 8, where the author speaks of the institution of the Levites as being still in force 'up to this day'), &c. It is contended, also, that the language of the Pentateuch varies very little from that of the last prophets, and that it can hardly be assumed that a thousand years should have made no perceptible difference in the idiom; more particularly has Deuteronomy been supposed to bear a striking resemblance, in style and language, to Jeremiah. The Pentateuch is further said to contain many facts palpably contradictory to natural laws, as they are established in the experience of the whole historical human race, and systematised by science.

Of the many ways to get rid of these and similar—old and new—exceptions, the most generally adopted is that which we mentioned as the method of 'interpolation,' by which the Apologetic School strikes out some fifty or more passages, as not belonging to the original work, but having crept in, by way of commentary, note, or explanation, in post-Mosaic times—the body of the work being thus saved, so to say, by a most extensive amputation. As to the argument from the language, it is said that the Pentateuch, being the divine book, by way of eminence, and embodying the very phrases (to the letter) made use of by the Almighty, must needs have served as a model for the next thousand years, and priests and Levites, the teachers of the people, were enjoined constantly to study and read it: hence the small difference in the later writers. Arabic and Syriac, it is argued, did likewise not change essentially for many centuries—an assertion, however, which only holds good if 'many' is taken in a very vague sense indeed. That Deuteronomy differs in style and manner, is verbose, &c., is explained by Moses's advanced age. On the other hand, events which are not in harmony with the 'natural laws,' are accepted by the orthodox simply and literally as 'miracles,' while 'conservative' rationalists of the school of Eichhorn, Rosenmüller, and others, who stand by the authenticity of the Pentateuch, have been at great pains to find some kind of poetical interpretation for them.

The most recent attacks on the authenticity are chiefly founded upon arithmetical grounds. The numbers of the people, their cattle, and the like, at various periods, do not seem to conform to the laws of natural increase, or even to the geometrical limits within which they were at times stated to have been confined. Among the direct proofs, however, proffered by the defenders of the authenticity, the following chiefly deserve attention. Deuteronomy, it is averred, can only be the work of Moses. He speaks in it to the men whom he has led for many years, as one who has lived through all the events himself. There is no possibility of any one imitating the local colouring in such a manner. If, then, Deuteronomy must be allowed to be the work of Moses, the three preceding books, to the contents of which frequent allusion is made, must equally be supposed to be finally redacted, if not written, by the same hand; and it further follows naturally, that the introduction to these books, which is Genesis, must have emanated from it. Again, any one writing after Moses, could not possibly have possessed the extraordinarily correct knowledge of contemporary Egypt and Arabia, which appears throughout the Pentateuch. A writer who might be supposed to have acquired it by dint of study of antiquities, must, it is said, have betrayed himself on every page by inaccuracies and

anachronisms. Nineveh is in Genesis a city of as yet little importance; while Resen, of which no trace is to be found in any other part of the Bible, is the great metropolis of Assyria of the time. Tyre, great in the days of David, and mentioned already in Joshua, is not to be met with in the Pentateuch, where a later writer would certainly have spoken of it in connection with Sidon. The Canaanite gods and altars are often spoken of; never their temples, of which yet we read in Joshua. Why, then, should that very ancient author, to whom must needs be traced the Pentateuch, not be Moses himself, rather than some contemporary of his? The fragmentary, abrupt, and, as it were, confused character of the work, the apologists further urge, so far from testifying against Moses, confirm the tradition of his authorship. Would not a later historian have worked the mixed mass of historical, geographical, legal, and personal material into a methodical and systematical whole? Who else could have imparted to the book the impress of a diary, so to say, but the man who was in the midst of the events, jotting down all the items important either in his own individual or the national career? And who but one standing in its very centre could depict with such glowing colours the life that moved around him?—But a further direct argument for the authenticity is found by them in the very item of the language of the Pentateuch. True, they say, it resembles as much as can be that of the later books, because, as we said before, it remained the classical language for all later generations; but, on the other hand, it offers certain peculiarities—such as the use of a common pronoun of the third person singular for both the masculine and feminine genders; the same term for boy and girl; and the like archaisms—all of which distinctly prove it to be a work of a very much older date. The existence of an ancient Mosaic code of laws would further appear proved beyond any doubt by the constant recurrence of quotations from 'the Law of Jehovah' or 'the Law of Moses' throughout the other books of the Old Testament from Joshua to Hosea. Had there in reality been no such code in existence, the authors of the different biblical works could not possibly have so unanimously spoken of it without betraying a conscious forgery somewhere. That Ezra should have been the author, or, at all events, the refounder of the Pentateuch, is equally improbable, on account of the spirit, tone, language, and all those smaller peculiarities of which mention has been made; and he would, on the other hand, never have been able so skilfully to avoid his own individual manner and style, as it appears in his own book. The Samaritan P., it is further said, which, with a very few characteristic alterations, is an accurate transcript of our Pentateuch, would have been an utter impossibility, considering the hostile relations between the Samaritans and the Jews, if it had not been well known as a genuine document before the division of the empire. That Hilkiah, who is said to have found the Book of the Law in the temple in the days of Josiah (2 Kings, xxii.; 2 Chron. xxxiv.) should have been its real author—an opinion first advanced by De Wette—would imply a complicity in the forgery not only on the part of Jeremiah, Huldah, and the elders, but almost of the whole people, among whom, on the contrary, there certainly seems to have been living a very vivid tradition of the former existence of the book or some of its portions at least. Moreover, had it been first written in those days, there surely would have been introduced some kind of prophetic allusion to the royal house of David, or, at all events, a pedigree and origin differing from the incestuous

one given in Gen. xxxviii. Deuteronomy would altogether have changed its language about Royalty (xvii. 15–20) very considerably; and Joseph's would not have stood out so prominently as a favoured tribe. The alleged difficulties respecting the numbers are explained away more or less convincingly—in the most difficult cases, by miraculous interference. Corruptions, interpolations, and the many fates that befall ancient documents, are allowed to have crept in, in some places; although this argument is given up by those who hold that a special providence watched over the divine work. In all other respects, they hold these books are exactly as they were written by Moses under direct 'Inspiration.'—Thus far, in swiftest outlines, the pros and contras most commonly adduced, and worthy of some consideration.

A few rationalistic critics, however, have gone so far as to deny the very possibility of Moses having given the laws contained in the Pentateuch, chiefly founding their objections upon the ground that he was not likely to have been versed in the art of writing to an extent which the composition of these laws would presuppose. Egyptian characters, with which he might have been familiar, could not have been used for Hebrew composition; and the Hebrews themselves, uncultivated as they were, did not possess any characters of their own. There has only, in reply to these objections, that fact to be stated, that a soberer criticism of more recent date has found itself obliged, in deference to certain paleographical and other scientific truths, to give up most of these points, or, at all events, to found no such sweeping condemnation upon those which still remain. On the contrary, whichever of the hypotheses enumerated at the beginning is assumed, the groundwork of the legislation is traced back, by almost unanimous consent, to the historical person of Moses, who is no longer the mythical demigod of barbarous hordes, but a man, such as we have endeavoured to sketch under that head. The final redaction of these laws, however, as of the whole of the Pentateuch, is almost as unanimously—more especially by German critics—placed in ages long after him.

In the contemporary 'moderate' school in England, so far as we have been able to glean from their writings, the following seems to be the prevalent opinion on the point of the Mosaic authorship: It is allowed, that Moses did not write the whole of the Pentateuch, but portions of Exodus, Leviticus, and Numbers, and the whole of Deuteronomy, with the exception of the account of his death, and such portions as palpably shew an author who points to the imminent dissolution of the empire. That even the fundamental Law (Decalogue) should be found in two varying versions, they hold, strengthens rather the assumption of their genuine Mosaic authorship in some original shape. The later editor, finding two different recensions made by contemporaries, or in subsequent ages, embodied them both, on account of their paramount importance, literally. Genesis was worked up from ancient documents, composed by various writers, living at various 'prehistoric' periods, either by Moses himself, or under his supervision, by some of the elders. The first redaction of the five books as a whole took place after the conquest of Canaan, through Joshua and the elders; the second and final redaction, however, in which it received its present shape, is to be dated from the time of Ezra, after the return from the exile.

The majority of continental modern critics of the more moderate stamp—who repudiate the notion of their belonging to the advanced rationalistic party—hold opinions of a very different kind; and since they have found professed partisans in England, the

lament of whom as Dr Davidson, we will make use of his own words (*Introduction to the Old Testament*): "There is little extant evidence for the Mosaic authorship; and what little there is does not stand the test of criticism." The "evidence" in defence of the Old Testament is not good at all. The venerable antiquity of Exodus himself has no proper bearing on the question. The objections derived from internal structure are conclusive against the Mosaic authorship. Various contradictions are irreconcilable. The traces of a later date are everywhere. The narratives of the Pentateuch are mostly trustworthy, though partly mythical and legendary. The miracles recorded were the suggestions of a later age. The name of God, *Yahweh*, without probability, is said to have extensively entered all the passages attributed to him. Moses's law led the imagination of the editors of God's word, which has grown into the proportions in which we see it now; and he was not the first writer who used parts of the national legends and history. He was emphatically a seer, not a historian, a great spiritual order in the life-drama of the nation, who founded their theocratic constitution upon the direct guidance of the Supreme."

A few words must be said respecting the use of the Pentateuch. According to Deut. xxi. 24 and 25, it was preserved in the Ark of the Covenant. About seventy years, it had to be read to the people in public; and probably the Schools of Esphata, founded at the time of Samuel, propagated its use as a law. Moreover, certain priestly, sacrificial, and other laws required constant reference to it, so that certain portions of it seem to have been ready to use as an early period. Every synagogue, according to the traditional law, to possess a roll of the *Torah*, written on parchment, but under certain strictly limited upon regulations, out of which will certain portions are read on Sabbath and feast-days; and, according to the same custom in Palestine, when Monday and Tuesday were the market-days—when the country people came to town and the judges sat—also on these days. A smaller portion (*Parashat*) is read on time and on the afternoon service of the Sabbath time on the Sabbath morning service, when a whole *Parashat* is read, or rather chanted, according to the *Shema*, which is held and about at the same time. The Samaritans have, of all biblical books, only adopted the Pentateuch, with slight variations. The Samaritan *Book of Joshua* being a very different work from ours, and contains very much accounts of their possessing other adaptations of our biblical books require confirmation. For the different translations of the Pentateuch, ancient and modern, see *VARIANT*. The first printed edition of the Pentateuch dates Bologna, 1492, fol. The laws of commentators and writers on the whole of the Pentateuch, both in and out of the Church, is large. We mention among the foremost, besides the *Chasidic Fathers* (Augustine, Jerome, Ephraim, Syme, etc.) and the medieval Jewish commentators (Rashi, O. Kimchi, Aben Ezra, Calvin, Luther, Strauss, de Clero, Spinoza, Maimonides, Eichhorn, Jahn, de Wette, Keil, Havernick, Black, Hengstenberg, Hirsch, Kurtz, Knobel, Berthou, Colenso, Graves, Stuart, Bala, etc.).

PENTECOST (By. *pentecostē*, fiftieth) was the name given to the feast among the Jews, held on the fiftieth day after the passover, in celebration of the "resurrection," and in thanksgiving for the harvest. See *FESTIVALS*. From the Jewish use it was introduced into the Christian, and with special solemnity, as being the day of the descent of the Holy Spirit on the apostles, and of the first solemn preaching of the Christian religion. From early

times, pentecost has been regarded as one of the great festivals of the Christian year, and it was chosen as one of the times for the solemn administration of baptism; and the English name of the festival, *Whitsunday*, is derived from the white robes in which the newly-baptized were clad. It is regarded as specially sacred to the Third Person of the Blessed Trinity, to whose honour the services of the day are directly addressed. Many antique images were anciently connected with the celebration. The dove, being held as an emblem of the Holy Ghost in some churches, a figure of a dove, surrounded by a cord from the ceiling, was lowered to us to alight on the high altar during the service. In others, figures of living doves, or red roses, leaves, were similarly introduced. The latter practice is said to be still retained at Moscow, but in general these secular representations have been discontinued. In some places, however, in the East as well as in the West, the practice persists of decorating the churches with garlands and flowers, as is done in England at Christmas. The whole time intervening between Easter and Pentecost is celebrated in the Roman Catholic Church with special solemnity, and with some peculiar images, and of this something is retained in the Church of England.

PENTHOUSE, a projection forming an open roof or shed, protecting a doorway, gate, window, &c.

PENTLAND FIRTH, a channel or strait between the Atlantic and German Oceans, separating the mainland of Scotland from the Orkney Islands. It is 17 miles long, and from 6 to 8 miles wide. About a mile west of Dunsum Head is a ferry station, whence boats cross to Barwick, in the island of South Ronaldshay, a distance of 7 miles. The Pentland Skerries, 5 miles north-east of Dunsum Head, consist of two islets, and of several contiguous rocks. On the larger of the islets is a lighthouse with two lights, one of which is 170, and the other 140 feet above sea-level. The lat. of the lighthouse is 58° 41' N., long. 2° 55' W. Off the coast of Orkney, and separated from it by a channel called the Inner Sound (about 2 miles in width), is the island of Stromo; and 3 miles north-north-east of Stromo is the islet of Scaun, one of the Orkneys. On the north side of Stromo is the small vortex or whirlpool of Scaun, and west of it are the breakers called the 'Men of Moy,' which are supposed to be produced by a current setting strongly on a concealed reef. The navigation of the P. F. is more dangerous than that of any other portion of the Scottish coast. A current setting from west to east flows through the Firth with a velocity of from 3 to 9 miles an hour, and causes numerous eddies and whirlpools. It is estimated that about 4000 vessels with cargoes pass through the Firth annually.

PENTLAND HILLS, in the Lowlands of Scotland, extend north-east from the border of Lanarkshire to the centre of the county of Edinburgh, and to within 4 miles of the city of that name. Mean height upwards of 1000 feet; highest summit, East Cairn, near the middle of the range, 1539 feet.

PENUMBRA. When the shadow of an opaque object is thrown upon a surface at some little distance by a light of considerable apparent size, it is observed that the shadow is divided into two portions, a dark portion in the centre, and a lighter portion surrounding it. The former is known as the *umbra*, or complete shadow; the latter as the *penumbra*, or partial shadow. A reference to the

figure will at once make plain their origin and relation, for if *S* be the illuminating body, *E* the object whose shadow is cast on the surface,

ABCD, it is seen that the small portion, *uu*, receives (omitting all consideration of refraction, dispersion, &c., of light) no light from *S*, while the whole surface outside of PPPP' is completely illuminated. The point *P* receives light from the whole of *S*; the point *F* is only half illuminated, and that by the lower part of *S*, the illumination of the points becoming less and less as they approach *u*, which is unilluminated. The portion within *uu* is the umbra, and that between the boundaries PPPP' and *uu* is the penumbra, which, as we have seen, gradually shades from perfect light at the outer boundary to perfect darkness at the inner, so that it is almost impossible exactly to note its limits on either side. This phenomenon, it is evident, can only occur when the illuminating body is of such a size, real or apparent, as to make the angle, P'Ku', of sensible magnitude; and it is equally evident that the nearer the body *E* approaches the plane on which its shadow is cast, the larger is the umbra and the smaller the penumbra; while by increasing the distance between *E* and the plane, so that the point *L* shall fall between them, the umbra is made to vanish, and the penumbra is increased. This is well illustrated by natural phenomena: the shadow of a man cast by the sun on the ground presents almost no penumbra; the shadow of the earth thrown by the sun upon space at the distance of the moon gives a penumbra many times as large as the umbra; and sometimes, when the moon is new at her apogee, for instance, her shadow cast upon the earth exhibits no umbra. Spectators on the earth who see a partial eclipse of the sun, are situated within the penumbra, but within the umbra when they observe a total eclipse; while if the eclipse be annular, the umbra does not exist in the shadow cast by the moon on the earth's surface. See ECLIPSES.

PENZA, a central government of European Russia, between the government of Nijni-Novgorod on the north, and that of Tambov on the west. Area 14,670 square miles, pop. 1,161,575. The surface is in extensive and elevated plains, marked occasionally with ridges of low hills. The rivers are tributaries of the Don and Volga, and three of them, the Khoper, the Soura, and the Moksha, are navigable. The climate, though rather cold in winter, is temperate, agreeable, and healthy. The soil, consisting, for the most part, of black earth, is extremely fertile, and agriculture is the principal employment of the inhabitants. Grain of different kinds, leguminous plants, beet-root, flax, hemp, tobacco, and hops are the principal products. Much of the grain is used in the numerous distilleries, and considerable quantities of it are exported to the neighbouring governments. About one-third of the entire area is covered with forests, some of

which consist entirely of oak-trees. The manufactures are centred chiefly in the towns; cloth and leather are the principal articles made. The commercial improvement of the government is hindered by the want of direct means of communication with the consuming districts. The principal towns are Penza, Mokshansk, and Saransk.

PENZA, a town of European Russia, capital of the government of the same name, on the Soura, 220 miles south-south-east of Nijni-Novgorod. It was founded in the middle of the 17th c., as a defence against Tartar invasion, is a handsome town, occupying an elevation, and containing 19 churches, 2 convents, many gardens, a large park, with a beautiful fruit-garden and a horticultural school. It possesses 2 cloth-factories, 4 iron-works, several soap-boiling and candle-making establishments. The principal articles of commerce are corn and timber, which is floated down the Soura during spring. Pop. 22,280.

PENZA'NCE, a market and sea-port town, and a municipal borough of England, in the county of Cornwall, stands on the north-west shore of Mount's Bay, 22 miles west-south-west of Falmouth. It is the most westerly town in England—the light-house on its pier being in lat. 50° 7' N., and in lon. 5° 28' W. The town, standing on a finely-curved shore, surrounded by rocky eminences, and in a fertile district, is exceedingly picturesque in situation, and is famous for its mild, though somewhat moist climate. Its esplanade, one of the finest in the west of England, commands charming land and sea views. The chief buildings, most of which are constructed of granite, are the town-hall and corn-market, surmounted by a dome, and the chapels of St Paul and St Mary. There are numerous boarding-houses for the accommodation of the visitors attracted hither by the temperate and equal climate, by the beauty of the neighbouring scenery, and the curiosities of the district of Land's End. Woollen yarns and cloths are manufactured; the fishery employs upwards of 2000 persons; agricultural produce, pilchards, and tin and copper ores produced from the mines of the vicinity are exported; and timber, iron, hemp, and hides are the chief imports. The harbour is accessible for vessels of considerable burden, and is furnished with a pier 800 feet in length. In 1863, 3732 vessels of 360,511 tons entered and cleared the port. Pop. (1861) of municipal borough, 9414.

P. was laid in ashes by a party of marauding Spaniards in 1595, and was sacked by Fairfax in 1646.

PE'ON. See CALOPHYLLUM.

PEORIA, a city and port of entry in Illinois, U.S., on the west bank of the Illinois River, which is crossed by two bridges of 2500 feet, at the outlet of Peoria Lake, 70 miles north of Springfield, and 160 miles south-west of Chicago. It is connected by steamboat navigation with the Ohio and Mississippi, by canal with Lake Michigan, and is an important station on the great network of western railways. Bluffs of bituminous coal, opening upon the river banks, supply numerous manufactories. There are 24 churches, and numerous schools and public institutions. Pop. (1860) 14,425.

PEPÉ. Three Neapolitans of this name have played an important part in history. The first of these was GABRIELE PEPÉ, who was born in 1781 at Bojano, in the present province of Campobasso, Italy, and was a student of law in 1799, when, on the proclamation of the Parthenopean Republic, he took service in the Franco-Neapolitan army, and was consequently exiled on the fall of

the new government. Subsequently he served in the Italian legion in the French army under King Joseph in Spain with great distinction, and with Merit. In 1816 he was raised by the latter to the rank of colonel, a grade confirmed by Ferdinand I., who gave him the command of a province, and afterwards of the garrison of Syracuse. He acquired great credit and the name of the revolutionary party in 1820, and was elected to the national parliament, in the downfall of the constitutional government, he was elected by the Austrians, and imprisoned at Trieste, in 1825; but was released at the end of two years, and retired to Turin; where, feeling lost at some remarks of M. de Lamartine, then minister of foreign affairs in that country, on Italian politics, he at once withdrew the pen in defence of his countrymen with such severity that a duel resulted between him and the poet, followed by an apology from the latter. From this time he took no part in political affairs, he devoted himself to science and literature, and died at Bologna, August 1843. His name, GIOVANNI PEPE, born in 1781 at Squillace, was a name of equal note. After serving in the French army of Gaudin, and according to high rank and honour, he returned to Naples to support Maria; and after the death of that child, was one of the leaders of the 'Miseration' party, yet after the restoration, the Bourbon Ferdinand allowed him to retain his honours. He rendered valuable services in routing out (1818) the bands of brigands who infested the provinces of Avellino and Foggia, and after the insurrection of 1821, was for some months the most influential man in Naples; but, after his trial by the Austrians at Rome, 7th March 1821, he was forced to flee the country, and took refuge in Spain, whence he retired to England, where he lived many years, afterwards returning to Paris. In 1846, on the proclamation of his activities, he returned to Naples, welcomed with enthusiasm by the people and the court, and his first contribution by the public press, gave him the command of the Neapolitan contingent which he sent to aid the Lombards against Austria; but after the suppression of revolution in Naples (23d May), P. was ordered to return and put down the insurgents of Calabria. Dispersing these when P., with as many of the Neapolitans as would adhere to him (2000 men), devoted his energies to the defence of Venice, of whose army he had been elected commander-in-chief. His prudence and courage, joined to an untiring energy, enabled him gradually to retard the operations of the Austrians; but the loss under his command was so great, for effecting anything of importance. His most remarkable exploit was the sortie he effected in person (October 1848) from the citadel of Naples. After the fall of Venice, P. had to take on board a French ship, and subsequently returned to Paris. He had, however, an antipathy to France, and speedily removed to Turin, where he died, 30th August 1846. He has left several works, the chief of which are, *Relation des Evénements Politiques à Milan et de Naples en 1820 et 1821* (Paris, 1823, in Italian and French), and *Histoire des Insurrections et des Guerres d'Italie en 1847, 1848, et 1849* (Paris, 1849). A cousin of him has been named in Turin.—His elder brother, PLOMMEIRO P. (born 1787, died 1849), was also a Marquis, but subjected to Ferdinand I. He was a mild and conciliatory, but fraille liberal.

PEPERINO, an Italian term, applied by some antiquaries to the brown volcanic tuffs derived from the tuffs, to distinguish them from the ordinary ones, which name they confine to the lighter-colored pituitous rocks that have more trachyte in their composition.

PEPIN, the name of several distinguished members of the Merovingian family; the first of whom in order was PEPIN LE VIEUX or PEPE LE LAEON, the founder of the family. He was of a Belgian family, and took his designation from Landis now in Liège, Belgium). Rebelling with others of the great lords of Austrasia against the rule of Theobald, who was reputed for the faithful king, he offered the crown to Clotaire II., king of Neustria, who, in reward of his services, created *P. maire de France* of Austrasia, an office which he continued to hold during the two following reigns, and died in 613. His administration was directed to the preservation of the peace and integrity of the Austrasian kingdom; and though, by opposing the various schemes of centralization proposed by the king, he fell under the royal displeasure, his conduct gained for him esteem and influence with the Austrasian chiefs; his power and wealth were greatly increased, and a broad and firm path to political supremacy laid for his descendants. His son, GRIMOLD, who succeeded him as *maire de palais*, immediately attempted to gather the fruits of his father's schemes before they were quite ripe, and accordingly suffered for his folly. Both he and his son CHILDEBERT were strangled in prison (636) by order of Clotaire II. Pepin 'the Old' left by his daughter a grandson, PEPE LE JEUNE or PEPE D'HERMINE, who was elected by the Austrasian nobility as their chief to protect Austrasia against the machinations of Ebroin, the able viceroy of Neustria. His first step was to rid himself of the Merovingian king who nominally ruled over Austrasia; which was effected by obtaining the condemnation of the unfortunate monarch, Dagobert II., by a council of bishops, and then putting him to death. From this time the Merovingian rule in Austrasia ceased. P. was now sole ruler, but his ambition did not stop here; he had resolved on the ruin of the Merovingian monarchs, and accordingly levied a large army for the invasion of Neustria. Ebroin, on his side, was equally resolved to humble the territorial aristocracy, and support the throne; and advancing into Austrasia, his army came in sight of P.'s at Loup. In the battle (689) which ensued, P.'s army was totally defeated, his brother and co-ruler, MARIN, was taken prisoner and put to death, and he himself narrowly escaped. Luckily for him, however, Ebroin was soon afterwards assassinated, and his successor, WARATO, signed a treaty of peace. The incapacity and tyranny of Warato and his successor, BERTHAIRE, discontented the Neustrian nobles, who went over to P., and by this accession of power enabled him to resume the offensive. Neustria was immediately invaded, and a bloody but decisive battle at Testry (687) freed P. of his opponent BERTHAIRE, who was left dead on the field, and placed Neustria at his feet. Full of moderation in the midst of triumph, and satisfied that he could not place on the throne a more obedient slave than Thierry III., the then king of Neustria, P. caused him to be also proclaimed king of Austrasia, but reserved for himself the sovereign power, wielding the sceptre though declining the crown. From this time he ruled the whole of France (Austrasia in his own right by his election as Duke, and Neustria as *maire de palais*) with energy, and undisturbed by any internal commotion, during the lives of three other 'faisant' kings, till his death in 714. He had made several campaigns (689–705) against the Frisians, but that valiant and independent race was not thoroughly subdued for some time afterwards. P. had two legitimate sons who died before him, and an illegitimate son, CHARLES, subsequently known as CHARLES MARTEL (q. v.), who succeeded to his power.—The third who bore this name was PEPIN LE BEAU, the

younger son of Charles Martel, who, on the death of his father in 741, received Neustria and Burgundy; Austrasia, Thuringia, and Suabia being the heritage of his elder brother Carloman. Aquitaine was nominally a part of P.'s dominions, though, as it was really independent under its own duke, he made several attempts to subdue it; but the duke was quite able to hold his own against both P. on the one hand and the Arabs (from Spain) on the other. The farce of governing the country in the name and as the chief minister of the Merovingian sovereign was still kept up, though P. was eagerly longing for an opportunity to assume the crown; but the present time was inopportune, as no sooner was the restraint of Charles Martel's iron hand removed by death, than revolts broke out in all quarters among the Franks, Germans, Bavarians, and Gascons. The country, by the united exertions of P. and Carloman, was restored to tranquillity about 745. Those princes who had excited the insurrection were mostly deposed, and otherwise punished, and the Duke of Aquitaine was compelled to acknowledge at least the nominal sovereignty of Pepin. In 747, Carloman bade adieu to power, and retired into a convent, leaving his government to his sons, who were immediately dispossessed by Pepin. After crushing a rebellion of Saxons and Bavarians, P. began to carry out his favourite project of dispossessing the Merovingian dynasty of even the semblance of authority, and of originating in person a new royal dynasty. To gain his point he flattered the clergy, then the most influential body in France; and as they had been despoiled by Charles Martel for the behoof of his warriors, a moderate degree of kindness and generosity on the part of P. contrasted him so favourably with his father, that the clergy at once became his partisans. So did the pope, who felt the importance of securing the aid of the powerful Frankish chief against the Lombards, who were then masters of Italy, and released the Franks from their oath of fidelity to Childeric, the Merovingian monarch. On learning this, P. at once caused himself to be elected king by the assembly of estates at Soissons, and was consecrated by the Bishop of Mayence (March 752). Childeric retired to a convent, where he died in 755. P. was the first Frankish monarch whose election received the sanction of the pope, and who was consecrated to his high dignity; and these solemn ceremonies put the crown to a great extent at the mercy of the clergy, who from this time took a political rank in the state. The practice, too, followed by P. and his predecessors in office, of gaining partisans by granting particular fiefs to various chiefs, greatly strengthened the feudal system, and proportionally weakened the royal power. This effect, however, did not shew itself till after the subsequent reign of Charlemagne, on account of the personal genius of these two rulers. P. was soon called upon to aid the pope against the Lombards, and marching into Italy at the head of a large army, he compelled Astulf, the Lombard king, to retire from the siege of Rome, and restore several cities which had previously belonged to the Greeks; these were now handed over to the pope. He had hardly returned to France, when he was anew summoned (755) to Italy, the Lombards having broken their engagements. This time he took Ravenna, Emilia, the Pentapolis, and the duchy of Rome from the Lombards, reuniting them to the Holy See. After the settlement of affairs in Italy, the turbulent nations on his eastern frontier demanded his attention. The Saxons and other German tribes were defeated (757), their country cruelly ravaged, a heavy tribute exacted, and numbers of captives and hostages taken. Resolved to unite the whole of Gaul under his authority, he

eagerly accepted the invitation of the Visigoths of Septimania to aid them against the Arabs, who had taken possession of the country; and after a war of many years' duration, Narbonne, the last of the Arab strongholds, was taken, and the country, freed of these invaders, at once acknowledged P.'s authority. The remaining years of his reign were occupied in reducing the independent monarchy of Aquitaine, which was not accomplished till, after nine years (760—768) of desolating warfare, P. obtained the assassination of his opponent, Duke Waifre, whose partisans then laid down their arms, surrendering to the Frankish monarch the vast provinces which stretch from the Loire to the ocean and the Pyrenees. Shortly after this conquest, P. died of dropsy, September 768. He was a most active, enterprising, and in general fortunate prince; he established the unity of the Gallic nation, and protected it as far as could be done by invading and ravaging the territories of the neighbouring nations, though he also introduced those elements of weakness into its constitution which reduced the authority of his successors to such a deplorable state. The others of this name, though important personages at the time, make little figure in history.

PEPPER (*Piper*), a genus of plants of the natural order *Piperaceæ* (q. v.), which once included the whole of that order; but, as now limited, consists of plants with woody stems, solitary spikes opposite to the leaves, and covered with flowers on all sides, the flowers mostly hermaphrodite. The most important species is **COMMON P.** or **BLACK P.** (*P. nigrum*), a native of the East Indies, now cultivated also in many tropical countries, and extensively in some parts of the New World; its fruit being the most common and largely used of all spices. It is a rambling and climbing shrub, with smooth and spongy stems, sometimes twelve feet in length; and broadly ovate, acuminate, leathery leaves. The fruit is about the size of a pea, of a bright red colour when ripe, not crowded on the spike. In cultivation, the P. plant is supported by poles, or by small trees planted for the purpose, as it loves a certain degree of shade, and different kinds of trees are often planted for this purpose in India. It is propagated by cuttings, comes into bearing in three or four years after it is planted, and yields two crops annually for about twelve years. When any of the 'berries' of a spike begin to change from green to red, all are gathered, as when more fully ripe they are less pungent, besides being apt to drop off. They are spread on mats and separated from the spikes by rubbing with the hands or by treading with the feet, after which they are cleaned by winnowing. The **Black P.** of commerce consists of the berries thus dried, and become wrinkled and black; **White P.** is the seed freed from the skin and fleshy part of the fruit, to effect which the dried fruit is soaked in water and then rubbed. **White P.** thus prepared is of a whitish-gray colour, but not unfrequently undergoes a bleaching by chlorine, which improves its appearance at the expense of its quality. **Black P.** is much more pungent than **White P.**, the essential constituents of the spice being more abundant in the outer parts of the fruit than in the seed. P. depends for its properties chiefly on an acrid resin and an acrid volatile oil; it contains also a crystalline substance called *Piperin*.—The fruit of *Piper tricoctum*, a species very similar to the Common P., is more pungent; and it is cultivated in some parts of India.—The fruit of other species of *Piperaceæ* is used as pepper in their native countries; that of *Coccoloba Capense* at the Cape of Good Hope; that of *Peltobryon longifolium*, of *Artanthe crocata*, of *A. trichostachya*, and of *Serronia jaborandi* in South

PEPPERMINT—PERAMBULATION OF PARISHES

Amor. — *Clusia Benhurghii* and *C. officinarum* and the Latin *Verena* of dysentery. They have many medicinal uses, culinary, either opposite to the uses, those of *Verena*, and the fruits are also used as the spikenard in preparing to become a sweet meat. The spikenard are gathered when green and dried in the sun. They are used in cooking and the culinary purposes, also in medicine for the same purposes as *Verena* Pepper. They are generally reported to be more pungent than *Verena* Pepper. *C. Benhurghii* is cultivated in India and the Greys, where it is called *Pepul*. *C. Benhurghii* is the Dutch East India colony, the red and the most part of the stem of *C. Benhurghii* are extensively used in India as a stimulant property, and are cut into small pieces, dried, and sold to the market under the name of *pepula*.

It acts on the skin as a rubefacient and vesicant, and is often used for this purpose as a powdered form, combined with some kind of absorbent spirit. It is also employed as a local stimulant in rubefaction of the vessels, and is applied in the form of an ointment for myalgia. Taken into the stomach, a small quantity of it is a pleasant stimulant, but in large doses it produces great pain and irritation. Its immediate use, however, by the natives of hot climates, much exceeds anything known among Europeans, and the effects are evidently local rather than systemic. The chief use of *P.* is as a local stimulant.

It was known to the ancients, Hippocrates called it a medicine, and Pliny expresses his opinion that it should have some other general name, deriving the word of flavus. In the middle ages it was one of the most useful spices, and in the 16th a few pounds of it were reckoned a precious good. The quantity now imported into Europe is enormous, but there are no means of exactly estimating how much of the *P. of commerce* is the produce of *P. (non rubens)* or indeed of the *fraxinosa*, or how much, although certainly it is not a large proportion of the whole—in the produce of species of *fraxinosa*.

The name P is popularly given to substances having a pungency resembling that of P., which is combined by very different plants. Thus, *Peperomia* P. is the perfume of species of *Peperomia*, of the natural order *Solanaceae*; *Jasminum* P. for perfume of species of *Jasminum*, of the natural order *Rubiacae*; and *Guinea* P., or *Melastomata* P., a species of the natural order *Scrophulariaceae* and *Guinea*, the *Caryophyllus*, *Pimenta*, *Grains of Paradise*, and *Guinea* *Peperomia*.

RECEIVED: May 30, 1961

FIFTH PAGE: a substituted West Indian dish, of which Cassava (p. 5) is a principal ingredient; not doing with it such as dried fish, vegetables, and the various parts of the ocher (see *Broussard*), see *Chili* (see *Chili*).

TURNER ROOT (*Ipomoea diphylla*), a perennial herbaceous plant, of the natural order *Cruciferae*; a native of North America, with pairs of alternate leaves, and numerous of white flowers; the root of which has a pungent mustard-like taste, and is used as a cathartic.

FF-100123 has been already described (in the same manuscript) as one of the essential constituents of the growth rates. Various modes of extracting it from the walls of the stomach of the calf, sheep, and man have been proposed by different chemists (Wasson, Fritzsche, Schmidt, Reinhold, and others), but which is unnecessary to cite. According to a preliminary analysis, it contains 59.6 per cent of carbon, 6.7 of hydrogen, 17.5 of nitrogen, and 16.2

of oxygen, and hence in its ultimate composition it is closely allied to albumen. This substance, either as a powder or in solution, has been employed at late years to a considerable extent in medicine, in cases of disordered digestion from deficient or impeded secretion of gastric juice, and of cerebral-fermentation, typhoid and other debilitating fevers. Popaine was at one time the best form in which to prescribe this substance; a compound being the ordinary dose. The fact that popaine has not been thought deserving of a place in the British pharmacopoeia, seems to indicate that its efficiency as a remedy is not generally recognised in this country.

PEPYS, SAMUEL, a distinguished officer of the Admiralty during the reigns of Charles II. and James II. he was born February 23, 1632-1633. He was the son of a London citizen, a tailor, but was well educated, first at St. Paul's School, and afterwards at Magdalen College, Cambridge. His cousin, Sir Edward Montagu (the first Earl of Sandwich), introduced him to public employment. In 1660 he was appointed Clerk of the Acts of the Navy, and in 1673 Secretary for the Affairs of the Navy. He was an excellent public servant, active, diligent, and laborious; but during the famous contention of the English Fleet he was succeeded to the Tower, on an unfounded and slender charge of aiding in the design to depose the king and extirpate the Protestant religion. Having been discharged without a trial, P. was replaced as his post in the Admiralty, which he retained till the abdication of James II. For two years he held the honorable station of President of the Royal Society. He died May 26, 1703. P. wrote *Memoirs of the Great Navy*, 1691. He left to Magdalen College his large collection of books, MSS., and prints, including about 2000 ancient English ballads, forming five folio volumes. This curious collection was injured, he says, by Selden, and continued down to the year 1709, when the worms peculiar to the old ballads, namely, the black beetle with pictures, was first made for the slender modern fashion. P. is now best remembered for his *Diary*, dedicated to the Rev. J. Smith from the original shortened MS. in the Pepysian Library, Cambridge, and first published, under the editorial care of Lord Braybrooke, in 1825. It commences on the 1st of January 1660-1660, and is continued for above nine years, when the diarist was obliged from defective eyesight to abandon his daily task. As a picture of the court and times of Charles II. this *Diary* is invaluable; it was written in perfect confidence and secrecy; the events, characters, follies, vices, and peculiarities of the age are presented in true and lively colours, and the work altogether is one of the most rare, unique, and amusing books in the language.

PE'ILA, a suburb of CONSTANTINOPLE (q. v.).

PERAMBULATION OF PARISHES. The ancient custom in England of perambulating parishes in Rogation week had a twofold object. It was designed to supplicate the Divine blessing on the fruits of the earth; and to preserve in all classes of the community a correct knowledge of, and due respect for, the bounds of parochial and individual property. It appears to have been derived from a still older custom among the ancient Romans, called *Terminalia*, and *Ambarvalia*, which were festivals in honour of the god *Terminus* and the goddess *Ceres*. On its becoming a Christian custom the heathen rites and ceremonies were of course discarded, and those of Christianity substituted. It was appointed to be observed on one of the Rogation (i. e.,) days, which were the three days next before Ascension Day.

Before the Reformation parochial perambulations were conducted with great ceremony. The lord of the manor, with a large banner, priests in surplices and with crosses, and other persons with hand-bells, banners and staves, followed by most of the parishioners, walked in procession round the parish, stopping at crosses, forming crosses on the ground, 'saying or singing gospels to the corn,' and allowing 'drinkings and good cheer' (Grindal's *Remains*, pp. 141, 241, and *Note*; Whitgift's Works, iii. 266—267; Tindal's Works, iii. 62, 234, Parker Society's Edition), which was remarkable, as the Rogation days were appointed fasts. From the different practices observed on the occasion the custom received the various names of *processioning*, *rogationing*, *perambulating*, and *ganging the boundaries*; and the week in which it was observed was called *Rogation week*; *Cross week*, because crosses were borne in the processions; and *Grass week*, because the Rogation days being fasts, vegetables formed the chief portion of diet.

At the Reformation, the ceremonies and practices deemed objectionable were abolished, and only 'the useful and harmless part of the custom retained.' Yet its observance was considered so desirable, that a homily was prepared for the occasion; and injunctions were issued requiring that for 'the perambulation of the circuits of parishes, the people should once in the year, at the time accustomed, with the rector, vicar, or curate, and the substantial men of the parish, walk about the parishes, as they were accustomed, and at their return to the church make their common prayer. And the curate, in their said common perambulations, was at certain convenient places to admonish the people to give thanks to God (while beholding of his benefits), and for the increase and abundance of his fruits upon the face of the earth, with the saying of the 103rd Psalm. At which time also the said minister was required to inculcate these, or such like sentences, Cursed be he which translateth the bounds and doles of his neighbour; or such other order of prayers as should be lawfully appointed.' (Burn's *Ecclesiastical Law*, vol. iii. 61; Grindal's *Remains*, p. 168.)

Those engaged in the processions usually had refreshments provided for them at certain parts of the parish, which, from the extent of the circuit of some parishes, was necessary; yet the cost of such refreshment was not to be defrayed by the parish, nor could such refreshment be claimed as a custom from any particular house or family. But small annuities were often bequeathed to provide such refreshments. In the parish of Edgcott, Buckinghamshire, there was about an acre of land, let at £3 a year, called 'Gang Monday Land,' which was left to the parish-officers to provide cakes and beer for those who took part in the annual perambulation of the parish.

To this day, questions of disputed boundary between parishes are invariably settled by the evidence afforded by these perambulations; for in such questions, immemorial custom is conclusive. And so far are they recognised in law, that the parishioners on such occasions are entitled to trespass on lands, and even to enter private houses if these stand on the boundary line. In Scotland, where the parochial principle has never been developed as in England, there seem to be few traces of a similar practice. But, as between neighbouring landowners, a bribe of perambulation is the technical remedy for setting right a dispute as to boundaries or marches; and perambulating or 'riding' the bounds of boroughs is a common practice.

The necessity or determination to perambulate along the old track often occasioned curious

incidents. If a canal had been cut through the boundary of a parish, it was deemed necessary that some of the parishioners should pass through the water. Where a river formed part of the boundary line, the procession either passed along it in boats, or some of the party stripped and swam along it, or boys were thrown into it at customary places. If a house had been erected on the boundary line, the procession claimed the right to pass through it. A house in Buckinghamshire, still existing, has an oven passing over the boundary line. It was customary in the perambulations to put a boy into the recess to preserve the integrity of the boundary line.

At various parts of the parish boundaries, two or three of the village boys were 'bumped'—that is, a certain part of the person was swung against a stone wall, a tree, a post, or any other hard object which happened to be near the parish boundary. This, it will scarcely be doubted, was an effectual method of recording the boundaries in the memory of these *battering-rams*, and of those who witnessed this curious mode of registration.

The custom of perambulating parishes continued in some parts of the kingdom to a late period, but the religious portion of it was generally, if not universally, omitted. The custom has, however, in late years been revived in its integrity in many parishes.

PERCEPTION. This word refers to our reception of knowledge through the senses, an operation that to the common understanding seems simple enough, but, viewed philosophically, is attended with much difficulty. Perception, considered as a source of knowledge, refers exclusively to the outer, or the object world—the world of extended matter and its properties. The names for the act of knowing one's own mind—the feelings and thoughts of the individual—are Self-consciousness and Self-introspection. The word 'consciousness,' is sometimes improperly limited to this signification. Locke used the term 'Reflection' for the same meaning, but this is ambiguous, and is now disused. All our knowledge is thus said (by those that deny innate ideas) to spring from two sources—Perception and Self-consciousness.

Two great disputes connect themselves with Perception, both raised into their full prominence in the philosophical world by Bishop Berkeley. The first is the origin of our judgments of the Distances and real Magnitudes of visible bodies. In opposition to the common opinion on this subject, Berkeley maintained that these were learned by experience, and not known by the mere act of vision. See VISION.

The second question relates to the grounds we have for asserting the existence of an external and material world, which, in the view of Berkeley, was bound up with the other. Inasmuch as perception is a mental act, and knowledge is something contained in a mind, what reason have we for believing in the existence of objects apart from our minds? or what is the mode of existence of the so-called external world?

The following sentences shew in what manner Berkeley opened up the question: 'That neither our thoughts, nor passions, nor ideas, formed by the imagination, exist without the mind, is what everybody will allow; and it seems no less evident that the various sensations or ideas imprinted on the sense, however blended or combined together (i.e. whatever objects they compose), cannot exist otherwise than in a mind perceiving them. I think an intuitive knowledge may be obtained of this by one that shall attend to what is meant by the term *exist* when applied to sensible things. The table

with me, I say, while—I see, I see and feel it; and if I were out of my study, I should say it existed outside thereby that if I was in my study I might perceive it, or that some other spirit actually does perceive it. There was an *about*—i.e., it was outside. There was a *round*—that is to say, it was hard; a colour; an figure; and it was perceived by only one sense. This is all I can understand by them and the like expressions. For as to what is said of the absolute existence of unthinking things, without any relation to their being perceived, that seems perfectly intelligible. Their own existence, as to it possible they should have any existence apart from minds or thinking things which perceive them.

This doctrine of Berkeley, amounting, it was said, to a denial of the existence of a material world, struck us far from a correct view of it, was followed up by Hume, who, on similar reasoning, denied the existence of self, and resolved the universe into a mere flow of ideas and impressions without any subject to be impressed, acknowledging, nevertheless, that we feel himself really, practically, to exist, as to his own accountable existence. There was certainly some great mistake in a mode of reasoning that treated about a denial of the existence, and hence it has been the work of successful metaphysicians since that time to endeavour to put the perception of the world on an admissible basis.

Dr Reid explained against Berkeley and Hume, by appealing to Common Sense, or Unreflecting Intuition, as a sufficient foundation for our belief in the existence of a world apart from our own minds. Dr W. Hamilton has extended the same view and greater obscurity and precision. He considers that our consciousness tells us at once that in the act of perceiving there is both a *perceiving subject*—self, to the mind—and an *external reality*, in relation with which, as the object perceived. 'Of the nature of both these things, he says, 'I am convinced; because I am conscious of knowing each of them, not mediately in something else, as represented, but immediately in itself, as existing. Of their mutual dependence I am as less convinced; because each is approached equally and at once, in the same extensive energy, the one not preceding or determining the other not following or determined; and because each is approached out of, and in direct contact with the other.'—*Ibid.*, p. 547.

What, as Hamilton has believed to elucidate this doctrine to all its bearings, it has not been universally accepted as satisfactory. Many believe that it has remained as an ultimate fact of our consciousness what stands still further resolved, and has mistaken in perception of the matter mind for a perception of instinctive revelation.

Professor Cairnes, in his *Lectures on Metaphysics*, has gone through the question with extraordinary care and elaboration. His main position is the inseparability of the subject and the object in perception, in position also maintained by Hamilton in the above extract, which is not reconcilable with the common assumption as to the independent existence of matter. Indeed, he reduces the received dogma of the existence of matter *per se* to a self-contradiction, and builds up a system in strict consistency with the correlation or necessary connection, of the mind perceiving with the object perceived. His view approaches nearer to Berkeley than to Hume, or to Reid.

Those who would endeavour to show that our notion of the mind viewed is a complex fact, and an expression, and not a simple apprehension of the immaterial mind, explain themselves in the following words. It is in the exercise of force that we

have to look for the peculiar feeling of the externality of sensible things, or the distinction that we make between what impresses from without, and impressions not recognised as outward. Any impression that moves a stroke of energy within us, and that varies exactly and consistently as that energy varies, we call an outward impression. In common parlance Berkeley, as he thought, by kicking a stone, but in fact it was his own action with the common ignorance, and not the optical impression of a stone in the eye, that satisfied him as to the existence of something outward. The sensation of all the sensations for putting forth active energy, or for assuming that as possible to be put forth, is one external world.

We experience certain uniform recurring sensations and certain uniform changes in them, when we exert particular energies. Thus the visible picture of our dwelling is a permanent and tinted expression, and the variations of appearance that it is subject to correspond principally to our own conscious movements. As we move from one end of a room to another, we experience a change of the visible aspect at every step, and this regularly happens as often as we repeat the movement. But at least the appearance exists in another shape, to which we give the name of memory or *idea*. We draw a marked distinction between these two modes of presentation, the actual and the ideal, and we assign a superiority to the one over the other. The superiority we find consists itself with the relation to our own movements; a mere idea or mental picture remains the same whatever be our bodily position or bodily existence; the sensation that we call the actual is entirely at the mercy of our movements, shifting in every possible way (but uniformly) according to the variation of action that we go through. With a forward movement the visible impression enlarges, with a backward movement it diminishes. A certain movement of the eye shifts it out, another restores it. The raising of the head and the bending of the body are followed by an altered spectacle. We cannot but draw a broad distinction between the mental scenery that is thus shifted by all our movements, and the ideas and dreams that vary of themselves while we are still. To express the one fact we use the terms externality, the material world, independent existence; to express the other we employ the apposite language, internality, the world of mind, &c. Even if sensation were only in ourselves, we should still have to distinguish between present sensation and remembered or revived sensation; the reference of the one to our voluntary movements, and of the other to no such modifying cause, would oblige us to note a vital difference in the two classes of fact. Such is the uniformity of connection between certain appearances and certain movements, that we come to anticipate the one through the other. We know that in some one position, as when lying in bed, certain movements of the limbs and back will bring us to the sensation of a solid contact in the feet; that another series of movements will bring us a particular view to the right; that a third movement will give the sound of a bell in the ear, and so forth. We cannot avoid regarding these various sensible effects, brought uniformly into play by a regular series of waking voluntary actions, as totally different from our ideas, recollections, and dreams.

As our belief in the externality of the causes of our sensations means that certain actions of ours will bring the sensations into play, or modify them in a known manner, this belief is readily furnished by experience, and is no more than our experience enables us to entertain. When we have been

repeatedly conscious that a tree becomes larger and larger to the eye in connection with a definite locomotion on our part, called the forward advance; that this movement brings on at last a sensation of touch; that this sensation of touch varies with definite movements of the arms, and so on; the repetition of all this train of experience fixes it on the mind, so that from one thing alone, as from the distant vision of the tree, we can anticipate, or as it is otherwise called, *perceive* all the other consequences. We then know, without going through the steps, that the specified movements will bring about all the sensations above described, and we know nothing else; this knowledge, however, is to us the recognition of external existence, the actual fact that is meant when a material world is spoken of. Belief in external reality is the sure anticipation of certain sensations on the performance of certain movements; everything else said to be implied in it is but a convenient hypothesis for aiding the mind in holding together those multifarious connections that our experience has established in the mind. In order to account for the fact that the conscious movement of elevating the upper eyelid is followed with the sensation of light, to us and to other minds, we suppose a luminous agency always existing even when not affecting us or any other person; we cannot know or verify this supposition—it is a generalisation founded upon particular experiences, and serving to sum up those experiences in a convenient form, but no such perennial independent substance can be absolutely proved.

PERCEVAL, SPENCER, RIGHT HON., English minister, was the second son of John, Earl of Egmont; born November 1, 1762; educated at Harrow, and at Trinity College, Cambridge. He was called to the bar, and soon obtained a reputation as a diligent lawyer. A clever pamphlet on the abatement of the impeachment of Warren Hastings, made him known to Pitt. Obtaining a seat in parliament for Northampton, he was soon conspicuous for his extreme horror of popery, and his violent advocacy of what was called by his party the 'Protestant interest.' In the Addington administration, he was made Solicitor-general in 1801, and Attorney-general in 1802. He was afterwards induced to abandon his profession, and adopt a political career. In the Portland administration of 1807, he was made Chancellor of the Exchequer, and was even then the real head of the government, his influence with George III. being obtained by the depth of his bigotry and his pertinacious opposition to the Catholic claims. On the death of the Duke of Portland in 1809, P. became Premier, uniting to his office of Chancellor of the Exchequer that of First Lord of the Treasury. He was retained in power by the Prince of Wales on his accession to the regency. On the 11th May 1812, about 5 P.M., as P. was entering the lobby of the House of Commons, a man named Bellingham fired a pistol at him, the ball pierced his heart, and he instantly expired. The assassin made no attempt to escape. He was a Liverpool broker, trading with Russia, who, having sustained some losses and injuries, which he had vainly applied to the government to redress, determined to avenge himself by taking the life of the prime minister. P.'s assassination shocked the public mind, and parliament hastened to make an ample provision for his widow and numerous family. His death was, however, rather a private than a public calamity. 'With all my respect for the virtues and excellences of the late minister,' said the Marquis of Wellesley, who had held the office of Foreign Secretary in his administration, 'I still feel it my duty to say that I did not consider him a

fit man to lead the councils of this great empire.' He was ready in debate, a placid and not ungraceful speaker, and led the House of Commons with much tact; but he was superficial and intolerant. Sydney Smith, in his *Letters of Peter Plymley*, has conferred a species of immortality upon him by his wit and sarcasm. It was the fashion, when P.'s public policy was attacked, to laud his domestic virtues. 'Peter' said, if he had to choose between a public and private virtues, he should prefer that Mr P. owed for the veal of the preceding year, whipped his boys, and saved his country.'

PERCH (*Perca*), a genus of acanthopteroous fishes, of the family *Percidæ*, to which it gives its name, and which includes many genera and a very great number of species both of marine and fresh-water fishes. The *Percidæ*, or P. family, have the body somewhat oblong and more or less compressed; the scales rather large; the bones of the gill-covers toothed or otherwise armed; the mouth without barbels; the *vomer* toothed, and generally also the palate; there are sometimes two dorsals, sometimes only one. To this family belong not only the true perches, all of which are fresh-water fishes, but the Lates (q. v.) of the Nile, the Baasse (q. v.) or Sea P., and their congeners the Pike Perches (q. v.), the *Serrani*, and many other fishes. The true perches (*Perca*) have two dorsal fins, distinct and

Perch (*Perca fluviatilis*).

separate, the rays of the first spinous and those of the second flexible; the tongue is smooth; and the gill-covers are bony, notched, and sharply serrated. The COMMON P. (*P. fluviatilis*) is an inhabitant of the lakes, ponds, and still rivers of almost all parts of Europe. It is very common in England and Ireland, and is found in many of the waters of the south of Scotland, although in the north it is rare, and is said to exist only where it has been introduced. But it is found in Scandinavia, and even in Lapland. It is of a greenish-brown colour, passing into golden yellow on the under parts, and marked on the back with six or seven indistinct blackish cross-bands. Its height is about one-third of its length. It often attains a length of 16 or 18 inches, and a weight of 2 or 3 pounds, but perches have been taken of 8 pounds weight or more. The P. loves still waters, and is easily reared in ponds, but it is not a desirable inmate of ponds intended for other fish, because it is very voracious, and devours their fry. It is readily caught by almost any kind of bait, and sometimes takes a small artificial fly. It is much esteemed for the table. It lives a long time out of the water if kept moist, and in some countries is thus brought to market, and carried back to the pond if not sold. The female P. deposits her eggs in long strings, united by a viscid matter.—A species of P. (*P. Italica*), found in the south of Europe, differs from the Common P. in its shorter and deeper form, and want of black bands. Several species are natives of the rivers and lakes of North

America, and are among the most esteemed of its food and water tables.

PERCUSSOR. See POND.

PERCUSSION, a sailing or other enclosure separating a house or chapel from the rest of a church.

PERILORE, or **DEMI-GARTEIN**, in Gardiery, the lower half of a garter with the buckle.

Pericardium.

PERCOLATION, a process much used in Pharmacy, and in some other arts, for extracting certain soluble properties of various bodies by filtering a liquid through them. In the new British pharmacopoeia, 200 liniments and 9 extracts are ordered to be prepared by percolation. As the fluid seeks to find passage through the material acted upon, it displaces and carries with it the soluble parts, hence percolation is sometimes called the *Method of Displacement*. The forms of apparatus for percolations are very numerous, but the principle is the same in all. viz. a vessel with a porous bottom, and in the form of a distended tube inverted, receives the material first, and over it is poured the water or other fluid which is to obtain its virtues. One made by an eminent French pharmacist, M. Hupel, is very effective and complete. A is a long funnel-shaped glass, with a glass stop-cock (b) in the

Percolator.

bottom, which narrows to an inch diameter; this fits into the neck of a large globular vessel B, both being adjusted by grinding. C is a syringe of brass fixed on the glass B as shown, and made air-tight by a muslinose washer. a', a', a' are three depressures of porous felt, placed by the tube d, which allows air bubbles to escape from the bottom without disturbing the fluid. The material to be acted upon, as wood, bark, root, leaves, &c., is first powdered, and is then laid on the top of the uppermost depression, a', so as to half fill the space between it and the glass-cover c; water, or any other selected fluid, is then poured in until it is fluid, the stop-cock b is opened, and the operator draws the air from the outer vessel by means of the

air-pump C, the fluid is then rapidly drawn through the material, and displaces its soluble parts. a' and a' across the fine solid particles which are carried through the first depression with the liquid, and these substances which are also acted upon by the liquid which is checked at each division for a time. The fluid, when it reaches the distal glass, becomes dark coloured, is beautifully bright and clear, and the preparations so made are remarkable for their good quality and uniformity of strength. Within the present year (1864), Dr. Halstead, of the Pharmaceutical Institution, of Great Britain, has invented a new percolator of great efficacy. It consists of a funnel-shaped cylinder, with a cylinder of flannel inside, in which the materials are put. The whole is filled with the fluid menstruum, and at that which is in more immediate contact with the solid materials becomes charged with the soluble matter dissolved. It gives rise, as the density is increased, to an endosmotic action through the flannel walls of the inner cylinder until the whole is equalized, when it is drawn off by the top, and fresh fluid added until it comes away colourless. The outer cylinder has a tight cover to prevent loss by evaporation.

PERCUSSION, in Medicine, is the method of eliciting sounds by tapping, or gently striking the surface of the body; its object being to determine by the nature of the sound the comparative density of the subjacent parts. This mode of diagnosis was first employed by Avenbrugger in the middle of last century, and it was afterwards adopted by Corvisart in the investigation of heart disease; but its value was not fully appreciated till Laennec made the discovery of the chest his peculiar study, and since his time, its application and various new have been considerably extended by the labours of Piorry, Hughes Bennett, and other physicians.

Perussion is chiefly employed in the diagnosis of diseases of the lungs, heart, and abdominal organs. It may be direct (or, as some writers term it, *direct*), or it may be *indirect*. In the former case, the part to be examined is struck with the ends of the three first fingers of close together on the same level, or with a small hammer tipped with India-rubber; while in the latter, which is now almost universally adopted, a flat body is placed upon the chest, or other part to be examined, and is then struck by the fingers or hammer. The flat intervening body is termed a *Plectrometer* (from the Gr. *plein*, a blow, and *metron*, a measure). The instrument usually used as a plectrometer is a flat oval piece of ivory, but the left index or middle finger of the physician, with its distal surface fitted accurately to the part to be examined, acts equally well. The force of the stroke on the plectrometer—whether the stroke be made with the fingers or the hammer—must vary according as it is desired to elicit the sound from a superficial or a deep-seated part. The surface to be percussed should be exposed, or, at most, only covered with one layer of clothing; and the blow should fall perpendicularly on the plectrometer. When percussion is made over a considerable cavity filled with air—as the stomach or intestines—a hollow, drum-like, or (as it is usually termed by medical writers) a *tympanic* sound is produced. When any part of the surface of the chest is struck, below which there is a considerable depth of healthy lung-tissue, consisting of small cells filled with air, a clear sound, less loud and hollow than the tympanic sound, and termed the *pulmonary* percussive note, depending partly on the vibrations of the walls of the lung-cells, and partly on the vibrations of the walls of the chest, is evolved. When the subjacent substance is solid (as the heart, liver, or spleen) or fluid (as when there is effusion into a closed sac),

the sound is *dull* in proportion to the density and want of elasticity of the part struck. The first thing that must be acquired in order to make percussion useful in the diagnosis of disease, is an accurate knowledge of the sounds elicited from the different parts in their normal condition. When, for example, the healthy pulmonary percussion note is known, increased resonance of the walls of the chest will indicate a dilatation of the air-cells (or Pulmonary Emphysema), while various degrees of dullness will afford evidence of such morbid changes as the effusion of fluid into the pleura (Hydrothorax), or inflammatory solidification of the lung-tissue (the Hepatisation of Pneumonia), or tubercular deposition. The use of percussion in relation to diagnosis is further shewn in the articles PERICARDITIS and PLEURISY.

PERCUSSION CAPS are small copper cylinders, closed at one end, for conveniently holding the detonating powder which is exploded by the act of percussion in percussion-arms. Caps were not used with the earliest percussion-arms, which the Rev. Mr Forsyth of Belhelvie, Aberdeenshire, patented in 1807; but they became tolerably general between 1820 and 1830, and were adopted for the army by 1840. The manufacture is extremely simple: A sheet of thin copper is stamped into pieces of appropriate shape, which are bent into the form of caps by stamping-apparatus closing round a mandril, the whole being done in one machine by two operations. The caps are then placed in a tray, mouths upward; and the inside of each is touched with a strongly adhesive varnish. Over this is dusted the detonating powder, all the particles which fail to adhere being blown, dusted, or shaken out. A stamper once more is forced into the cap, to fix and compress the powder, and the operation is completed. Large numbers are filled and stamped together, so that many thousands per hour may be turned out by one machine. Admirable mechanism, for the manufacture of caps, is employed in the Royal Laboratory at Woolwich.

For muskets, the caps are charged with equal parts of fulminating mercury and chlorate of potash; for cannon, with a mixture composed of two parts of chlorate of potash, two parts of native sulphuret of antimony, and one of powdered glass; the last ingredient taking no part in the chemical action, and being added merely to increase the friction. For the manner in which a cap is used, see LOCK.

PERCUSSION, CENTRE OF. See CENTRE OF PERCUSSION.

PERCY. This is the name of a noble Norman family who accompanied the Conqueror to England, and whose head, William de Percy, obtained from his sovereign thirty Knights' Fees in the north of England. The representation of the house devolved (temp. Henry I.) on Agnes, daughter of the 3d baron, who married Josceline of Lovain, brother-in-law of the king, only on condition that he adopted either the surname or the arms of P.; he chose to retain his paternal arms and to assume the P. name. The head of the family at the time was one of the chief barons who extorted Magna Charta from King John; and the 9th feudal lord (temp. Edward I.) shewed a similar spirit towards the pope, against whose demands he maintained, with others of the greater barons, the spiritual independence of the English crown. This nobleman's great-grandson was a distinguished military commander under Edward III., and acting as Marshal of England at the coronation of Richard II., was created Earl of Northumberland. He subsequently, however, took up arms against Richard, and placed the crown on

the head of Henry of Lancaster, who became Henry IV. Again dissatisfied with the government, he joined in rebellion with his son Hotspur, for the purpose of transferring the crown to Mortimer, Earl of March. The earl, with the other leaders of this rebellion, fell at Bramham Moor (1407—1408), and his titles became forfeited. These, however, were revived in favour of his grandson, who became Lord High Constable of England, and who was killed at the battle of St Alban's. This earl's son and successor (the third earl) met a like fate on Towton field, fighting in the van of the Lancastrian army. The 4th earl (who obtained a reversal of his father's attainder) was murdered by the populace in Northumberland, when ordered by the avarice of Henry VII. to enforce a subsidy. The executions of the 6th and 7th earls by Edward VI. and Elizabeth are part of the history of England. The 8th earl was committed to the Tower, on a charge of being concerned in a plot in favour of Mary Queen of Scots, and died a violent death in prison. The 10th earl fought in the civil wars against Charles I., though he took no part with the regicides, and eventually joined in the general effort to bring about the Restoration. The 11th earl left an only child, who succeeded to the ancient barony of P., and marrying Charles, Duke of Somerset, became the mother of Algernon, Duke of Somerset, who was created Earl of Northumberland, with remainder to his son-in-law, Sir Hugh Smithson, of Stanwick, in the county of York, a gentleman of respectable lineage. Sir Hugh, succeeding to the earldom, obtained in 1766 his advancement to the dukedom of Northumberland, which title is now held by his grandson, the present duke, who thus represents the ancient house of P. only in the female line.

PERCY, THOMAS, D.D., an eminent poetical collector, antiquary, and scholar, was born at Bridgenorth, Shropshire, in 1728; was educated at Christchurch, Oxford; and having entered the church, rose to be Bishop of Dromore, in Ireland, 1782. He died in 1811. This amiable and accomplished prelate, the friend of Johnson, Goldsmith, and other distinguished contemporaries, published translations from the Icelandic, a new version of the *Song of Solomon*, the *Northumberland Household Book*, a translation of Mallet's *Northern Antiquities*, &c. His most popular and valuable contribution to our literature was the *Reliques of Ancient English Poetry*, consisting of old heroic ballads and songs, with some modern imitations, in which the editor himself displayed the taste and feeling of a poet. This work appeared in 1765, and P. lived to see four editions of it called for by the public, and to receive the warm commendations of all poetical readers and critics. The *Reliques* were chiefly obtained from an old folio MS. that had fallen into P.'s hands, with the addition of pieces from the Pepys collection at Cambridge, the Ashmole Library at Oxford, the British Museum, and the works of our earlier poets. Certain liberties were taken with some of the ballads—softening touches, repairs, and renovations—for which the editor was severely censured by Ritson and other antiquaries; but the collection was of great value to our literature, recalling the public taste to the rude energy, picturesqueness, and passion of the old chivalrous minstrels and Elizabethan songsters. It captivated the youthful imagination of Walter Scott, and was the inspirer and model of his *Minstrelsy of the Scottish Border*. The memory of P. has been still further perpetuated by a Club Book Association, called the *Percy Society*. See CLUB BOOKS, in Supplement.

PERDIDO, a bay and river of Alabama, U.S.

PEREGRINE FALCON—PERENNIAL.

The bay, 20 miles long by 5 to 10 miles wide, opens by a narrow channel into the Gulf of Mexico, 18 miles west of the entrance to Pensacola Bay; the bay runs in South-Western Alabama, and bay and river form the boundary between Alabama and Florida.

PEREGRINE FALCON (*Falco peregrinus*), a species of Falcon (q. v.) found in almost all parts of the world. The female is larger than the male, being about 18 inches in length from the tip of the bill to the tip of the tail, whilst the male is only about 15 inches. The female is the *Falcon of falconers*, and the male the *Tyrcel*. The plumage of the two sexes is very similar. The back, wings, and tail are black above or ash grey, the feathers barred with a darker tisk; the crown of the head black at the neck, and a spot below the eye, nearly black; the breast of the neck white, with dark longitudinal lines; the breast, belly, and plumage of the legs, white, with dark-brown transverse bars. The wings are very long, reaching almost to the tip of the tail; and the feet are remarkable for the power of claw, being capable of maintaining for a considerable time a grip of more than 100 miles an hour, so that it is often seen far from any of its haunts or breeding-places; whence the name *Percepsus*, from the Latin *perceptus*, a scout, the sweep, when resting on its quarry, is wonderful both for rapidity and force. The P. F. can easily carry through the air a bird or quail-sized fully its own weight. Its ordinary prey consists of grouse, woodcock, rabbit, &c. The woodcock is even said to secure itself by throwing its wing among branches of trees and bushes; the falcon follows, and strikes at least an equal power of moving with great rapidity in the thickest without getting unbalanced or delayed. Sometimes the quarry rises into the air, and seeks safety by trying to keep above the falcon, till both are lost to ordinary sight; but the falcon generally gets uppermost, and catches it at last. The quantity of game destroyed by the P. F. is very great. It is supposed that a large host of peregrine falcons will consume nearly ten times of grouse in a season, besides much other prey. The P. F. is a bird as remarkable for boldness as for power of flight. It has sometimes been seen to pounce on game shot by a sportsman, before it could fall to the ground; and an instance occurred in Yorkshire of a P. F. dashing through the glass of an aviary in a town, and carrying off a bird. It makes its nest on ledges of high rocks, often on the sub-crest or in inland precipitous and rocky, and lays from two to four eggs. Numerous localities in Britain have long been noted as breeding places of the P. F., and some of them were regularly visited, until January was a favorite spot, the young birds, which were not protected without danger and difficulty. The bird, caught when adult, although more difficult to train, was, however, believed to possess superior qualities. The P. F. is more docile, and becomes more gentle than the *Tyrcel*. The young female of the P. F. has been by mistake described by Pennant and others under the name of the *Lanner* (q. v.), a species now found in Britain. For fig. of P. F., see *Falcons*.

PEREIRA, JONATHAN, the pharmacologist, was born in the parish of Storditch, London, 23d May 1664. After a distinguished career at a classical academy in Finsbury, where he remained for four years, he devoted himself to the study of medicine, and in 1683 was appointed resident medical officer at the General Dispensary in Chancery Street, at which institution he became, three years afterwards, lecturer on

chemistry. His attention was early attracted to the study in which he has become famous. In 1694, he published a translation of the *London Pharmacopoeia*; which was followed by *A Manual of the Use of Studies*; *A General Table of Atomic Weights*, with an introduction to the Atomic Theory; and other treatises for the use of those who were preparing for medical examinations. He contributed numerous papers to the professional journals on the properties and administration of drugs, and laid the foundation of those researches which issued in the great work on *Medical Metes*. In 1723, he received the office of lecturer in that of Professor of Medical Metes in the New Medical School in Aldgate Street, and at the same time he succeeded Dr Gordon as lecturer on Chemistry at the London Hospital. His *Elements of Medical Metes* first published in the form of lectures contributed to the *Medical Times and Gazette* appeared in 4 separate works in 1733-1740, and at once established his reputation as a pharmacologist. The treatise is remarkable for the extent of its research, the variety of its information, whether scientific, commercial, or practical, and the scrupulous accuracy of its statements. In 1741, he prepared the library for practice in London from the College of Physicians; in 1746, he was elected a Fellow of that body; and on the establishment of the London University, he was appointed Reader in Medical Metes and Pharmacy, a post which he filled with admirable efficiency till his death. Among his other contributions to science, the best known are his excellent treatises on *Diet* and on *Phlegmatic Laxatives*, both of which appeared in 1743. His death, which took place on January 20, 1751, was the result of a fall down a flight of steps in the College of Surgeons, and was deeply felt, not only by his professional brethren, but by the numerous scientific bodies, such as the Royal Society, the Linnean, and the other societies of which he was a distinguished fellow.

PEREKOP, town in, in South Russia, government of Taurida, 16 miles long, 16 miles broad at its southern, and 5 miles broad at its northern extremity, connects the peninsula of the Crimea with the mainland of European Russia. It is an arid waste of mere sand or mud combined with clay. There are, however, numerous salt lakes, and salt is extensively made. In the north of the isthmus, and forming the key to the Crimea, is the small town of Perekop. Notwithstanding its advantageous position at the convergence of the numerous roads leading from South Russia into the Crimea, P. is of little commercial importance. Pop. of town 3297.

PERE-LA-CHAISE. See *La-Chaise*.

PREEMPTORY DEFENCE, in Scotch Law, means defence to an action or suit, which amounts to an entire negative of the right of action, as distinguished from a preliminary or temporary defence.

PERENNIAL, in Botany, a term employed in contradistinction to Annual (q. v.) and Biennial (q. v.), to designate plants which subsist for a number of years. Some plants, however, which are annual in cold climates, are perennial in warmer regions. The term perennial is in general applied only to herbaceous plants, and indicates a property only of their roots, the stems of most of them dying at the end of each summer. Perennial herbaceous plants, like shrubs and trees, are capable of producing flowers and fruit time after time, in which they differ from annual and biennial plants, which are fruitful only once. Those plants which are capable of being propagated by offsets, offset bulbs, or tubers, are all perennial. Thus the potato is a perennial plant, although the crop is planted in spring and reaped in autumn, like

that of corn, whilst all the corn plants are annuals.—There is great diversity in the duration of life of perennial plants.

PERESLAV, or **PEREIASLAVLE-ZALIE-SKY**, a district town in the middle of Great Russia, in the government of Vladimir, and 70 miles north-west of the city of that name. It was founded in 1052 by George, Prince of Soudal. It possesses upwards of 30 churches and religious institutions; but is principally noteworthy for its factories, which are nine in number, and of which the most important are cotton-mills and print-works for cotton goods. The factories yield in all an annual profit of about £3,000,000. The cotton manufactures of P. are exported to the fairs of Nijni-Novgorod and Irbit, and even to China by way of Siberia. Pop. 6783, employed in the factories and in the productive fishery of Lake Pleshtcheiff.

PEREZ, ANTONIO, minister of Philip II. of Spain, was born in Aragon in 1539. His father was Secretary of State under Charles I. and Philip II., and he himself was appointed to this office when only 25 years of age, and acquired the entire confidence of the king. Don Juan D'Austria, having sent his confidant, Juan de Escovedo, to Spain, to solicit aid against the party of Orange; and Escovedo having rendered himself an object of hatred both to the king and to P., the former resolved to put him out of the way by murder, and intrusted P. with the accomplishment of this design, which P., to gratify his own revenge, accomplished accordingly, 31st March 1578. The family of Escovedo denounced P. as the murderer, and all his enemies joined against him. The king at first sought to shield him; but in July 1581 he was arrested, and by torture forced to confess. He succeeded, however, in making his escape to Aragon, where he put himself under protection of its laws. After a long and severe inquiry into his conduct, he was found guilty of many acts of fraud and corruption, and condemned to death in Madrid; but the *Justicia Major*, or highest court of justice in Saragossa, refused to deliver him up. The king applied for aid in May 1591 to the Inquisition, and the Aragonese court delivered him up to its agents, but the people rose in tumult, and liberated him. This happened repeatedly; and at last, in September 1591, Philip II. entered Aragon with an army powerful enough to subdue all opposition, abolished the old constitutional privileges of the country, and caused a number of the principal people to be executed. P., however, made his escape, avoiding the many plots which the king laid for his assassination. He was condemned in Spain as a heretic, but was treated with great kindness in Paris and London. He spent the latter years of his life in Paris, and died there in 1611 in great poverty. P. wrote an account of his misfortunes, which was published at Paris in 1598, under the title of *Relaciones*.

PERFECTIBILITY OF CHRISTIANS, a doctrine held by the Wesleyan Methodists (see **METHODISTS**) of a *Christian perfection* attainable in this life. It is not a perfection of *justification*, but a perfection of *sanctification*; which John Wesley, in a sermon on Christian Perfection, from the text Heb. vi. 1, 'Let us go on to perfection,' earnestly contends for as attainable in this life by believers, by arguments founded chiefly on the commandments and promises of Scripture concerning sanctification; guarding his doctrine, however, by saying that it is neither an *angelic* nor an *Adamic* perfection, and does not exclude ignorance and error of judgment, with consequent wrong affections, such as 'needless fear or ill-grounded hope, unreasonable love, or unreasonable aversion.' He admits, also, that even in

this sense it is a rare attainment, but asserts that 'several persons have enjoyed this blessing, without interruption, for many years, several enjoy it at this day, and not a few have enjoyed it unto their death, as they have declared with their latest breath, calmly witnessing that God had saved them from all sin, till their spirit returned to God.' Concerning all which, the general belief of Protestant Christians is, that these persons were merely more self-complacent and less sensible of their own corruptions than is usual, and that the commands and promises concerning sanctification are all susceptible of an explanation consistent with remaining corruption in believers, and a need of further sanctification, or a continued going on unto perfection whilst this life endures.

That perfection is attainable in this life, is held by the Franciscans, Jesuits, and Molinists in the Church of Rome, but denied by the Dominicans and Jansenists. In advocating the doctrine, its Roman Catholic supporters generally rest much on the distinction between mortal and venial sins.

PERFORMANCE OF CONTRACTS is one of the modes of satisfying the contract, which may be either by doing some specific thing, or not doing something, or by payment of money. It is a good answer to any action brought by one party against another for breach of contract, that what was contracted for has been already performed.

PERFUMERY, PERFUMES (Fr. *parfum*, from Lat. *fumus*, smoke or vapour), delicate fumes or smells. Perfumes are of three distinct classes when derived from plants, and there is a fourth class, which are of animal origin.

CLASS I.—These are the most ancient, and have been in use from the earliest period of which there is record. They consist of the various odoriferous gum-resins, which exude naturally from the trees which yield them; and to increase the produce, the plants are often purposely wounded. The most important are benzoin, olibanum, myrrh, and camphor. No less than 5000 cwt. of these together are annually imported into Britain. Gum-resins form the chief ingredients in 'Incense,' (q. v.), and in Pastilles (q. v.).

CLASS II. are those perfumes which are procured by distillation. As soon as the Greeks and the Romans learned the use of the still, which was an invention imported by them from Egypt, they quickly adapted it to the separation of the odorous principle from the numerous fragrance-bearing plants which are indigenous to Greece and Italy. An essential oil or otto thus procured from orange-flowers bears in commerce to this day the name of *Neroly*, supposed to be so named after the Emperor Nero. Long before that time, however, fragrant waters were in use in Arabia. Odour-bearing plants contain the fragrant principle in minute glands or sacs; these are found sometimes in the rind of the fruit, as the lemon and orange; in others, it is in the leaves, as sage, mint, and thyme; in wood, as rosewood and sandal-wood; in the bark, as cassia and cinnamon; in seeds, as caraway and nutmeg. These glands or bags of fragrance may be plainly seen in a thin cut stratum of orange-peel; so also in a bay leaf, if it be held up to the sunlight, all the oil cells may be seen like specks. All these fragrant-bearing substances yield by distillation an essential oil peculiar to each; thus is procured oil of patchouly from the leaves of the patchouly plant, *Pogostemon patchouly*, a native of Burmah; oil of caraway, from the caraway seed; oil of geranium, from the leaves of the *Geranium rosea*; oil of lemon, from

lance-leaf; and a hundred of others of more variable variety.

The old names for these pure adhesive principles was *Quintessence*. Later, they have been termed *Essential Oils*; they are now, in modern scientific works, often termed *Odors* from the Turkish word *ot*, which is applied to the well-known oils or essences of roses. See this.

All the various essential oils or essences are very slightly soluble in water, so that in the process of distillation the water which comes over is always fragrant. Thus, after water, rose water, orange water, will water, &c., as it were, the residue of the distillation for obtaining the several oils. The process of distillation (q. v.) is very simple; the fragrant part of the plant is put into the still and covered with water, and above the water is made to boil the other rose along with the steam, are condensed with it in the pipes, and remain floating on the water, from which they are easily separated by decanting. In this way 100 pounds of orange, lemon, or bergamot fruit and will yield about 10 ounces of the fragrant oil; 100 pounds of cedar wood will give about 15 ounces of oil of cedar; 100 pounds of nutmegs will yield 60 to 70 ounces of oil of nutmeg; 100 pounds of geranium leaves will yield 2 ounces of oil.

Every fragrant substance yields in yield of essential oil. The variety of essential oils is and is, but there are a certain relationship among others as among plants. The lemon-like odors are the most numerous, such as yachana, lemon, bergamot, orange, citronella, then the almond-like odors, such as heliotrope, yamilla, violet, May-cherry odors, cloves, cinnamon, rose. The whole may be classified into twelve well-defined groups. All these oils are very soluble in alcohol, in fat, butter, and fixed oils. They also mix with water, alcohol, ether, sugar, milk, and other bodies, in which they impart their fragrance.

The principal consumption of the various fragrant oils is for making soap. Window soap, toilet soap, rose soap, and a great variety of others, some of various scents made of oil and tallow, perfume, white or a scented stone with the several essences of oils or mixtures of them.

Though small as by no means as popular an article as the value of Victoria as it was in Anne's time, yet the increased population, and still more increased exports to colonies, cause a positive increased production in scented soap now than fifty years past, and it is especially in demand in the far countries of Southern Canada. There is a large consumption of fragrant essential oils in the manufacture of toilet soaps, under the various names of rose powder, violet powder, &c., a mixture of starch and spirit, delicately scented, is in general demand for drying the skin of infants after the bath.

Prepared chalk and powdered cuttle-fish bone, long permeated with oils of rose, powdered myrrh, and camphor, become 'Dentifrices'. The oils of geranium, lavender, rose, and others, are artfully used in making sweetmeats and liqueurs.

More than 500,000 pounds weight of various oils were imported into Britain in 1860, and valued at over £1,000,000; to this must be added at least one-third as much again distilled in England. Of the largest articles enumerated, oils of lemon and bergamot, from the Two Sicilies, reached 125,000 pounds, valued at £57,954.

Class III.—These are the perfumes proper, such as are used for perfuming handkerchiefs, &c. Coming to the general total, nearly all the perfumes derived from flowers are not made by distillation, but by the process of *enfleurage* and *maceration*. Although this mode of obtaining the

odours from flowers has certainly been in practice for two centuries in the valley of the Var, in the south of France, it is only by the publication of a recent work* that the method has been made generally known. The odours of flowers do not, as a general rule, exist in them as a store or in a gland, but are developed as an exhalation. While the flower breathes it yields fragrance, but kill the flower, and fragrance ceases. It has not been ascertained when the discovery was made of enfleurage, as it were, the breath of the flower during life, what we know now is, that if a living flower be placed next to grease, instead of fat, butter, or oil, these bodies absorb the odour given off by the blossom, and in time themselves become fragrant. If we spread fresh muslined bottles upon the bottom of two dessert-plates, and then fill one of the plates with gathered fragrant blossoms of clove, covering them over with the second glassed plate, we shall find that after 24 hours the grease has become fragrant. The blossoms, though separated from the parent stem, do not die for some time, but live and exhale odour, which is absorbed by the fat. To remove the odour from the fat, the fat must be scraped off the plate and put into alcohol, the odour then leaves the grease and enters into the spirit, which thus becomes 'scented,' and the grease again becomes-absorption.

The flower farmers of the Var follow precisely this method on a very large scale, with but a little practical variation, with the following flowers: rose, orange, anise, violet, jessamine, tuberoses, and jessamine. The process is termed *enfleurage*. In the valley of the Var, there are acres of jessamine, of tuberoses, of violets, and the other flowers named; in due season the air is laden with fragrance, the flower harvest is at hand. Women and children gather the blossoms, which they place in little baskets like fishermen's baskets hung over the shoulder. They are then carried to the laboratory of flowers and weighed. In the laboratory the harvest of flowers has been anticipated. During the previous winter great quantities of grease, tallow, and lard have been collected, melted, washed, and clarified. In each laboratory there are several thousand dishes (saucers), or framed glasses, upon which the grease to be scented is spread, and upon this grease the blossoms are sprinkled or laid. The odour as it is, in fact, a frame with a glass in it as near as possible like a window-sash, only that the frame is two inches thicker, so that when one dish is placed on another, there is a space of four inches between every two glasses, thus affording space for blossoms. The illustration shows the dishes with grease and flowers upon it (fig. 1), also a pile of the same as in use. The flower blossoms are changed every day, or every other day, as is convenient in regard to the general work of the laboratory or flowering of the plants. The same grease, however, remains in the dishes so long as the particular plant being used yields blossoms. Each time the fresh flowers are put on, the grease is 'worked'—that is, scraped with a knife—as is to offer a fresh surface of grease to absorb odour. The grease being *exploited* in this way for three weeks or more—in fact, so long as the plants produce blossoms—is at last scraped off the dishes, melted, strained, and poured into tin canisters, and is now fit for exportation. Fat or oil is permeated with these same flowers by the process of maceration; that is, infusion of the flowers in oil or melted fat. For this end, purified fat is melted in a leaden ware, or warm bath, and the fresh

* *Art of Perfumery*, by Septimus Piesse, Ph.D., 5s. 6d. cuts. Longman.

blossoms are infused in it for several hours. Fresh flowers being procured, the spent blossoms are strained away, and new flowers added repeatedly, so long as they can be procured. The *bain marie* is used in order to prevent the grease becoming too

Fig. 1.
1, Châssis en Verre; 2, Châssis en Fer.

hot from exposure to the naked fire; so long as the grease is fluid, it is warm enough. Oil does not require to be warmed, but improved results are obtained when it is slightly heated.

Jasmine and tuberose produce best perfumed grease by enfleurage, but rose, orange, and acacia

maceration. In the engraving a *châssis en fer* (2, fig. 1) is shewn; this is for enfleurage of oil. In the place of glass, the space is filled with a wire net; on which is laid a *molleton*, or thick cotton fabric—moleskin, soaked with oil; on this the flowers are laid, just as with solid grease. In due time—that is, after repeated changing the flowers—the oil becomes fragrant, and it is then pressed out of the moleskin cloth. Oil of jasmine, tuberose, &c., are prepared in this way. In order now to obtain the perfume of these flowers in the form used for scenting handkerchiefs, we have only to infuse the scented fat or oil, made by any of the above methods, in strong alcohol.

In extracting the odour from solid fat it has to be chopped up fine as suet is chopped, put into the spirit, and left to infuse for about a month. In the case of scented oil it has to be repeatedly agitated with the spirit. The result is, that the spirit extracts all the odour, becoming itself 'perfume,' while the grease again becomes odourless; thus is procured the essence of jasmine, essence of orange flowers, essence of violets, and others already named, rose, tuberose, acacia, and jonquil.

It is remarkable that these flowers yield perfumes which, either separate or mixed in various proportions, are the types of nearly all flower odours; thus, when jasmine and orange flowers are blended, the scent produced is like sweet-pea; when jasmine and tuberose are mixed, the perfume is that of the hyacinth. Violet and tuberose resemble lily of the valley. All the various bouquets and roseays, such as 'frangipanni,' 'white roses,' 'sweet daphne,' are made upon this principle.

The commercial importance of this branch of perfumes may be indicated by the quantity of flowers annually grown in the district of the Var. Flower Harvest: orange blossoms, 1,475,000 lbs.; roses, 530,000 lbs.; jasmine, 100,000 lbs.; violets, 75,000 lbs.; acacia, 45,000 lbs.; geranium, 30,000 lbs.; tuberose, 24,000 lbs.; jonquil, 5000 lbs.

CLASS IV. Perfumes of animal origin.—The principal are Musk (q. v.), Ambergris (q. v.), Civet (q. v.), and Castor (q. v.). The aroma of musk is the most universally admired of all perfumes; it freely imparts odour to every body with which it is in contact. Its power to impart odour is such, that polished steel will become fragrant of it if the metal be shut in a box where there is musk, contact not being necessary.

In perfumery manufacture, musk is mixed with other odorous bodies to give permanence to a scent. The usual statement as to the length of time that musk continues to give out odour has been called in question. If fine musk be spread in thin layers upon any surface, and fully exposed to a changing current of air, all fragrance, it is said, will be gone in from six to twelve months.

Civet is exceedingly potent as an odour, and when pure, and smelled at in the bulk of an ounce or so, is utterly insupportable from its nauseousness; in this respect it exceeds musk. When, however, civet is diluted so as to offer but minute quantities to the olfactorys, then its perfume is generally admitted; this is so with gas-tar; but the fragrant principle is the same as that breathed by the beautiful narcissus. Castor is in our day almost obsolete as a perfume.

The average importation of musk per annum for the past five years is 9388 ounces, value £10,688; export 1578 ounces, value £2143; leaving for home-consumption every year 7810 ounces, value £8545. Average importation per annum for the past five years: otto of roses 1117 ounces, value £13,561; vanilla 3525 pounds, value £12,568; ambergris 225

Fig. 2.
1, Bain Marie; 2, Section of Bain Marie.

give more satisfactory products by maceration; while violet and jonquil grease is best obtained by the joint processes—enfleurage followed by

common value 2255, given 255 ounces, value 20771, and cost 470 hundredweight.

Two works on perfumes are very few; that of *Isidore Calaneo*, in the *Vibiano* house, is most worthy of notice among the French; a translation of it has been made for Mr G. Moore of Philadelphia. In England, *The History of Perfumes*, by C. Lally (1722), was the only work of the kind published in England prior to the *Art of Perfumery* by Septimus Poesi (1805).

PERIAMUS, or **PERIAMUM**, anciently a city of Mysia in Asia Minor, on the navigable river *Caicus*, at the distance of 100 miles from the sea. According to tradition, this place was of Greek origin, but its early history is quite insignificant. It first acquired prominence when *Lysimachus*, and at Alexander's command, used it as a stronghold in which to keep his treasures. Under *Philometus* it became the capital of a state, 552 B.C. His successor, *Seleucus I.*, maintained its independence against the *Selucidae*, although the title of king was first assumed by *Antiochus I.*, who reigned from 241 to 197 B.C. He ultimately allied himself with the Romans against *Philip of Macedonia*, and this alliance resulted subsequently, according to some, in which the kingdom continued in extent and importance, till at last *Antiochus III.*, surrounded *Philometus*, who died in 132 B.C., both of whom all his resources to the Romans, who immediately confirmed the right thus acquired, and under whom the city continued to flourish. It was the focus of all the great military and commercial routes of Asia Minor, and *Pliny* describes it as *large, populous, and fertile*. The *Attali* collected in it a library only inferior to that of *Alexandria*. It was also the seat of a famous grammar school, and it gave its name to *Parliament* (p. v.). P. sank under the *Roman* empire, but the place still exists under the name *Jengeneh*, and is noted for its splendor and magnificence of its ruins, which embrace temples, palaces, aqueducts, gymnasia, amphitheatres, and city walls.

PHILIPPO BISHOP, GIOVANNI BATTISTA, an eminent musician of the Neapolitan school. *Hyndley* mentions the date and place of his birth as conflicting; probably the correct account is that of the *Memorie di Villanova*, his latest biographer, who states that he was born at *Cast. near Ancona*, on the 21 of January 1710. In 1717 he was admitted into the *Consejo de la Poesia* di *San Crisostomo* at *Cast.*, where he studied the violin under *Domenico di Matteo*, and musical composition under *Giuseppe Vitti* and *Domenico*. Under the conviction that industry and taste were sufficient to learning by some of the masters of his time, he abandoned the style of *Monte* and *Giovanni* for that of *Vinci* and *Bassi*. His last great work was the oratorio of *San Geronimo di Aquilano*, composed in 1731. In 1732 and the following year appeared his operas of *La Norma Paterna*, *Il Prete di Napoli*, and *La Finta Sacerdotessa*; in 1734, *Adriano in Siria*; in 1735, *Il Pirata*, and *L'Orlando*. In 1734, he received the appointment of *maestro di cappella* of the Church of *San Carlo*. In consequence of delicate health, he removed to *Parma*, where he composed the oratorio of *Orfeo*, and his pathetic *Stabat Mater*. He died there of consumption in 1736. Besides the above-mentioned works, P. composed a number of songs for the church, which were better appreciated during his lifetime than his secular compositions, and a violin concerto, and thirty trios for violin, viola, and harpsichord. His works are all characterized by sweetness and freedom of style.

PHIL (Fairy), according to the mythical lore of the East, a being begotten by fallen spirits, which spends its life in all imaginable delights, is

immortal, but is for ever excluded from the joys of Paradise. It takes an intermediate place between angels and demons, and is either male or female. So far from there being only female *Phis*, as is supposed by some, and these the wives of the *Devi*, the *Phis* live, on the contrary, in equalled warfare with these *Devi*. Otherwise, they are of the most innocent character to mankind, and, exactly as the *fairies*, with whom our own popular mythology has made us familiar, are, when female, of engrossing beauty. One of the finest compliments to be paid to a *Phis* lady is to speak of her as *Perizadeh* (son of a *Phis*); (*Greek*, *Perizade*). They belong to the great family of spirits, or jinn; a belief in whom is rampant in the *Koran*, and for whose conversion, as well as the that of man, *Mohammed* was sent (cf. *Koran*, chap. iv, ix, xii, and lxxiv).

PERIAOVA, a large canoe composed of the trunks of two trees, hollowed and joined into one fabric; whereas an ordinary canoe is formed of the body of one tree only. *Periaovas* are used in the Pacific, and were formerly employed among the West India Islands, whence the frequent allusion to them in *Robinson Crusoe*.

PERIANTH (*Gr.* *peri*, around, *anthos*, a flower), in Botany, the floral envelope (see *Flower*) of those plants in which the calyx and corolla are not easily distinguished. The term is convenient, as it can be applied indifferently to the calyx and corolla; thus, when there is either a calyx or corolla wanting, but not both, the perianth is said to be single; when both are present, double. Both are really present in many endogenous plants, to which the use of the term perianth is confined by some botanists; the single floral envelope of exogenous plants being regarded as a calyx, and the corolla supposed to be wanting. The perianth is regular in some plants, irregular in others. It often displays great beauty, as in tulips, crocuses, lilies, &c.

PERICARDITIS, or Inflammation of the Pericardium (p. v.), is a disease of frequent occurrence; the result of a very large number of post-mortem examinations being to show that about 1 in 23 of all who die at an adult age exhibit traces of recent or old attacks of this disease.

For reasons which will be obvious when we come to speak of the physical signs of this disease, we shall commence with a notice of the anatomical changes which take place in the inflamed membrane. Very soon after symptoms of pericarditis begin to show themselves there is an abnormal dryness of the serous membrane, which is speedily followed by an increased secretion of fluid. The serous fluid is sometimes almost entirely fibrinous, in which case it coagulates, and gives rise to adhesions between the heart and the pericardium; or it may consist almost entirely of serum, which remains liquid; or it may be, and it most frequently is, a mixture of the two. When there is a large amount of liquid effusion (as, for instance, a third of a pint or more) which is not re-absorbed, death usually takes place in the course of a few days, in consequence of the interference of the fluid with the heart's action; but when there is not much liquid effusion, or when the liquid part is absorbed, the pericardium becomes more or less adherent, and apparent recovery usually takes place.

In the case that prove fatal when fibrinous fluid has been effused, but has not coagulated to such an extent as to cause complete adhesion of the heart to the pericardium, the partially coagulated fibrin (or lymph, as the older authors styled it) is seen to be of a yellowish-white colour, and to occur in a ragged, shaggy, or cellular form. *Lacune* compared the

surface on which the lymph is deposited to that which would be produced by suddenly separating two flat pieces of wood between which a thin layer of butter had been compressed. Dr Watson regards the appearance as more like the rough side of pieces of uncooked tripe than anything else; while others have compared it to lace-work, cut sponge, a honey-comb, a congeries of earthworms, &c. When the patient dies at a more advanced stage of the disease—viz., soon after the whole of the membrane has become adherent—incipient blood-vessels, in the form of red points and branching lines, are seen, indicating that organisation is commencing in the deposit, which if death had not ensued would have been finally converted into cellular or areolar tissue, and have occasioned the complete obliteration of the pericardial cavity.

The symptoms of pericarditis are pain in the situation of the heart, increased by a full inspiration, by pressure upon or between the ribs in the cardiac region, and especially by pressure upwards against the diaphragm by thrusting the fingers beneath the cartilages of the false ribs; palpitations; a dry cough and hurried respiration; discomfort or pain on lying on the left side; restlessness; great anxiety of countenance; and sometimes delirium. The pulse usually beats from 110 to 120 in a minute, and is sometimes intermittent; and febrile symptoms are always present. These symptoms are seldom collectively present in any individual case, and until the time of Louis the diagnosis of this disease was uncertain and obscure. The physical signs, dependent on the anatomical changes which have been described, are, however, generally so distinct that by their aid the disease can be readily detected. They are three in number. 1. In consequence of irritation propagated to the muscular tissue of the heart at the commencement of the inflammation of its investing membrane, the ventricles contract with increased force, rendering the sounds of the heart louder and its impulse stronger than in health, or than in the more advanced stages of the disease. 2. When much fluid is effused into the pericardium, dulness on percussion is always observable to a greater degree than in health. This sign, which is very characteristic, is seldom perceived till the disease has continued for two or three days. In relation to this increased dulness, we must premise that in the healthy condition of the heart and lungs there is an irregular roundish space with a diameter of somewhat less than two inches, extending from the sternum (or breast-bone) between the level of the fourth and fifth ribs towards the left nipple, in which a portion of the surface of the heart is not overlapped by the lungs, but lies in contact with the walls of the chest. This space should normally be dull on percussion. In pericarditis the extent of the dulness beyond the normal limit indicates the amount of effusion. In extreme cases the dulness may extend over a space whose diameter is seven inches or more. Simultaneous with the increased dulness, there is a diminution of the heart's sounds in consequence of the intervening fluid, and the impulse is often scarcely perceptible. 3. The rubbing of the inflamed and roughened surfaces upon each other gives rise to a sound which is commonly called the *friction sound*, but which has received various names. Thus Dr Watson calls it a *to and fro* sound, and observes regarding its variations that, 'like all the other morbid sounds heard within the chest, it is capable of much variety in tone and degree. Sometimes it very closely resembles the noise made by a saw in cutting through a board; sometimes it is more like that occasioned by the action of a file or of a rasp; but its essential character is that of *alternate rubbing*; it is a *to and fro*

sound.' This sound is heard early in the disease, before the surfaces of the pericardium are separated by the effusion of fluid; and it is due either to the dryness of the membrane, or to its roughness from the deposition of lymph. When the contiguous surfaces are either separated by fluid, or become adherent, the sound disappears; but when it has been lost from the first of these causes, it reappears after the fluid has been so far absorbed as to permit the surfaces again to come in contact. But here, again, its duration is brief, for the surfaces soon become adherent and cease to rub upon each other.

Pericarditis is a disease which occasionally runs a very rapid course, and terminates fatally in forty-eight hours or less. In ordinary cases, however, which terminate in apparent recovery, the disease generally begins to yield in a week or ten days, and excepting that adhesion remains, the cure appears to be complete in three weeks or less. But although these patients *apparently* recover, the pericardial adhesion commonly occasions other structural changes of the heart sooner or later to develop themselves; and in those cases that the physician has the opportunity of subsequently watching, it is observed that fatal disease of the heart, primarily due to the pericarditis, almost always supervenes. In slight cases it is probable that a true cure, without adhesion, may take place.

Pericarditis frequently arises from exposure to cold when the body is warm and perspiring. It is no uncommon result of a contaminated state of the blood, such as occurs in the exanthematous diseases, especially scarlatina, and in Bright's disease of the kidney; but beyond all comparison, it is of most frequent occurrence in association with acute Rheumatism (q. v.), of which it forms by far the most dangerous complication.

At the commencement of the disease, blood should be freely taken (if the patient is tolerably robust) from the region of the heart either by cupping or repeated leeching; and at the same time every attempt must be made to get the system under the influence of mercury to the extent of rendering the gums tender and of affecting the breath. Not only should calomel in small doses, and combined with opium with the view of preventing purging, be frequently given, but mercurial ointment should be rubbed into the arm-pits and inner sides of the thighs, and the mouth should be kept slightly sore for some time. After three or four days, if there should be much fluid effusion, a large blister should be applied over the heart; and if the patient is not already under the influence of mercury, the raw surface may be dressed with mercurial ointment. Perfect rest both of body and mind is of essential importance, and all possible causes of excitement should be excluded. The diet should be mild and chiefly farinaceous, and little or no animal food should be allowed till the beginning of convalescence. Cooling drinks are agreeable to the patient, and may be taken freely with advantage throughout the disease.

PERICARDIUM, THE, is a conical membranous sac, containing the heart and the commencement of the great vessels, to the extent of about two inches from their origin. It is placed with its apex upwards behind the sternum, and to its left side, in the interval between the pleura—the serous sacs in which the lungs are enclosed; while its base is attached to the diaphragm. It is a fibro-serous membrane, consisting of an external fibrous and an internal serous layer. The fibrous layer is a strong, dense, fibrous membrane; the serous layer invests the heart, and is then reflected on the inner surface of the fibrous layer. Like all serous membranes, it is a closed sac; its inner surface is smooth and

summing, and securing a firm hold which serves to fasten the natural movements of the heart. It is a representation of this service, which constitutes the highest service as possible.

PERICLES. See FERRY.

PERICLES (P. PERICLES). The most accomplished statesman of ancient Greece was born of distinguished parents in the early part of the 5th c. B.C. His father was the Naxian who won the victory over the Persians at Mycale, 479 B.C., and his mother, Agariste, was the niece of the great Athenian reformer Cleisthenes. P. enjoyed an elaborate education; but of all his teachers the one whom he most revered and from whose instructions he derived most benefit, was the philosopher Anaxagoras (q. v.). P. was conspicuous all through his career for the singular purity of his manners, the 'Olympian' character of his language, his sagacity, prudence, and profound Athenian patriotism. When he entered on public life, Aristides had only recently died. Themistocles was an exile, and Cimon was fighting the battles of his country abroad. Although the family to which he belonged was good, it did not rank among the first in order of either wealth or influence, yet so transcendent were the abilities of P., that he rapidly rose to the highest power in the state as the leader of the dominant democracy. The sincerity of his attachment to the 'popular' party has been questioned, but without the shadow of evidence. At an early age, the measures which either personally or through his adherents he brought forward and caused to be passed, were always in favour of increasing the privileges of the poorer class of the citizens. P. seems to have grasped very clearly, and to have held as firmly, the modern 'radical' idea, that as the state is supported by the taxation of the body of the citizens, it must govern with a view to power and not to cash interests. In 451 B.C. he, through the agency of his followers, Ephialtes, made a great blow at the influence of the oligarchy, by causing the decree to be passed which deprived the Areopagus of its most important political powers. Shortly after, the democracy obtained another triumph in the extinction of Cimon. During the next few years the political career pursued by P. was very clearly discernible, but in general his object was hostile to the desire for foreign conquest or territorial aggrandizement, so prevalent among his ambitious fellow-citizens. In 444 B.C., he shortly after, he magnanimously proposed the measure (which was carried) for the recall of Cimon, and about the same time commenced negotiations with the other Hellenic states with the view of forming a grand Hellenic confederation, the design of which was to put an end to the mutually hostile relations of kindred peoples—to make of Greece one united nation, fit to front the outlying world. On this point not less sagacious than noble. Had it been accomplished, the more barbarous Macedonians would have remained the civilized Greeks in fact, and even Rome at a later period might perhaps have found the Adriatic, and not the Euxine, the limits of her empire. But the Spartan aristocracy was utterly incapable of cordially appreciating and joining patriotism, or of understanding the political necessity for it, and by their secret intrigues brought the well-planned scheme to naught. Athens and Sparta were directly, and indeed had for some time been, at that point towards each other which marked the future Peloponnesian war inevitable. They are always bound on opposite sides. Thus the Spartans, in 445 B.C., refused to the Athenians the guardianship of the temple and treasure of Delphi, of which they had been

deprived by the Persians. The Athenians immediately after marched an army thither, and reinstated the latter. Three years later, an inscription looks out to the territory tributary to Athens, Megara, Eretria, &c., and the Spartans again appeared in the field as the allies of the insurgents. The position of Athens was critical. P. wisely declined to fight against all his enemies at once. A body of ten talents sent the Spartans home, and the insurgents were then rapidly and thoroughly crushed.

Cimon was now dead, and was succeeded in the leadership of the aristocratic party by Thucydides, son of Milesias, who in 444 B.C. made a strong effort to re-establish the supremacy of P. by attacking him in the popular assembly for squandering the public money on buildings, and on festivals and amusements. Thucydides made an effective speech; but P. immediately rose and offered to commit the buildings at his own expense if the citizens would allow him to put his own name upon them instead of theirs. The assembly was silenced, and P. was empowered to do as he pleased in the matter. But P. did not mean to be simply sarcastic, he wished to point out to the Athenians in a delicate way the spirit and aim of his policy, which was to make Athens, as a city, worthy of being the head and crown of Hellas. His victory in the assembly was followed by the election of Thucydides; and during the rest of his career 'there was, says the historian Thucydides, 'no more a democracy, but in reality a government in the hands of the first men.' The same author, however, informs us that he never did anything unworthy of his high position; that he did not flatter the people, or oppress his adversaries; and that with all his unlimited command of the public purse, he was personally incorruptible. Soon after this the Samian war broke out, in which P. acquired high renown as a naval commander. This war originated in a quarrel between the Milesians and Samians, in which Athens was led to take a part with the former. The Samians, after an obstinate struggle, were beaten, and a peace was concluded in 440 B.C. The position in which Athens then stood towards many of the Greek states was peculiar. Since the time of the Persian invasion she had been the leader of the confederacy formed to resist the attacks of the powerful enemy, and the guardian of the confederate treasury kept in the city of Delos. P. put the treasury removed to Athens, and committing the contingents of the allies for money. Athens, of course, herself undertaking to protect the confederacy—increasingly increased the contributions to the 'patron's fund.' The grand charge against P. is, that he applied the money thus obtained to other purposes than those for which it was designed; that, in short, he adorned and enriched Athens with the spoils of the allied states. But the objection is more plausible than solid. For, in point of fact, Athens kept up in admirable discipline a great fleet and a fine army, and P. made the Greek name more respected in his time than it had ever been before. It may be that his conduct is open to criticism in some respects, but a broad and just view of the motives which impelled him to act as he did, and a fair consideration of the political exigencies of the time will, in the main, justify his procedure. It is unnecessary to give a detailed account of all that he did to make his native city the most glorious in the ancient world. Greek architecture and sculpture, under his patronage, reached perfection. To P., Athens owed the Parthenon, the Propylæa, the Akropolis, and manifestly other public and sacred edifices; he also liberally encouraged music and the drama;

and, during his rule, industry and commerce were in so flourishing a condition, that prosperity was universal in Attica.

At length, in 431 B.C., the long-foreseen and inevitable 'Peloponnesian war' broke out between Athens and Sparta. With the circumstances that led to it we have not here to do, but as it terminated most disastrously for Athens, it is but right to say that P. is not to blame for the result. Had the policy which he recommended been pursued, one can hardly doubt that Athens, with her immense resources, would have been the victor, and not the vanquished, in the struggle. P. himself died in the autumn of 429 B.C., after a lingering sickness. His character has been sufficiently delineated in the outline of his life which we have given. His connection with the brilliant Aspasia (q. v.) is noticed elsewhere.

PERIER, CASIMIR, a celebrated French statesman, was born at Grenoble, in the department of Isere, France, 21st October 1777. His father had enriched himself by mercantile and industrial pursuits, into which he initiated his two elder sons; but Casimir was still studying at the college of the Oratory at Lyon when the revolution broke out. He immediately went to Paris, and there associated himself with his father and elder brother Antoine-Seipion in their endeavours to found a banking company. It is sufficient to notice here that the banking company was firmly established, and became the Bank of France. Casimir was drafted into the army in 1798, and served in an engineering corps till 1801, when he returned to Paris, and resumed the position of coadjutor to his brother. The house of P. prospered greatly under the empire; the peace which followed the events of 1815 aided the development of their plans, and gave a wider scope to their enterprises; and the public regarded with special favour men such as these two brothers, who devoted their abilities and fortunes to foster the growth of public, as well as their own, prosperity. In 1817, P. published three tracts, in which he condemned the financial policy of the ministry. These papers made a lively impression on the public, and led to the return of the author to the Chamber of Deputies by the electors of Paris. P., in his political principles, was essentially a Constitutionalist, equally far removed from absolutism on the one hand, and extreme democracy on the other. The elections of 1824, conducted under government influence, resulted in the ousting of the greater portion of the Constitutionals. P., however, and a few others of the chiefs of the party retained their seats; but their opposition to the ministerial measures, though constant and unwearying, was quite ineffective; it, however, raised them greatly in public opinion, and secured their re-election in 1827. In this year, P. had the honour of being elected as representative by both the departments of the Seine and Aube. He defended the loyal and sagacious administration of M. de Martignac, whose representations to the king, Charles X., seemed to have the effect of reconciling the royal party to government in conformity with the charter; but the subsequent rule of the Prince de Polignac reduced this hopeful state of affairs to its former critical condition. The revolution (of July 1830), which P., from his experience of that of 1789, had made every endeavour to prevent, now followed, and it only remained for him to render it as bloodless as possible. In this he was successful, through his great influence with the people of Paris. On August 3, he was elected President of the Chamber of Deputies, but resigned this office on the 11th of the same month to become a member of the ministry. When Laffitte became

President of the Council (November 2), P., fearing that the tendencies of the ministry were too revolutionary, resigned office, and resumed the presidency of the Chamber of Deputies. On 13th Mar 1831, he succeeded Laffitte as minister, and gave his whole attention to the repression of revolution, the maintenance of order at home and of peace abroad, originating the political system known as the *juste milieu* (q. v.). His foreign policy was very successful; he greatly contributed to the maintenance of Belgian independence, the suppression of the Miguelite insurrection in Portugal, the counterbalancing of Austrian influence in Italy, and, in general, to the spread and progress of constitutional liberty both at home and abroad; but the rapid growth of extreme liberalism in France, partly owing to previous encouragement unwittingly afforded by himself, was a source of great annoyance to him. On the outbreak of cholera in Paris, March 1832, P. made the most extraordinary exertions for the enforcement of the necessary sanitary measures; but he was attacked by the disease, and his system being already exhausted by over-exertion, he died, 16th May 1832. No public man in France was ever so generally and sincerely lamented, and a monument to his memory was erected by public subscription in the cemetery of Père-la-Chaise.

PÉRIGÉE (Gr. *peri*, near; *gē*, earth), that point in the moon's orbit which is nearest to the earth. The opposite point is the Apogee (q. v.). See MOON.

PÉRIGUEUX, a town of France, capital of the department of Dordogne, and situated on the right bank of the Isle, 68 miles east-north-east of Bordeaux. It consists of the ancient city of P. Proper—which is gloomy in aspect, and has narrow streets, but large and solidly-built houses—and the *Puy St Front*, which, until the year 1240, was a separate and a rival town. In the old town, there are many curious remains of Gothic architecture. The old ramparts have been demolished, and replaced by beautiful and spacious boulevards. The cathedral of St Front is a majestic edifice, restored at the end of the 15th century. Quarries of building-stone are worked in the vicinity, and many hands are employed in cutting and polishing marble. Paper, woollen cloths, cutlery, and hosiery are manufactured. The celebrated *Pâtés de Périgueux*, made of partridges and truffles, are largely made and exported. Pop. 16,422.

P., a town of the highest antiquity, is the *Vesuna* mentioned by Cæsar. In ancient times, it was a city of much importance. It stood at the junction of five Roman roads, and contained a number of splendid edifices. Close to the modern town are still to be seen the remains of a vast amphitheatre, oval in form, and larger in its dimensions than the ancient amphitheatre of Nîmes. There are also remains of ancient aqueducts, baths, and temples. The *Tour de Vésone* is the most remarkable fragment of Roman architecture. It is still 67 feet high, and appears to have been much higher; is 200 feet in circumference, and has walls 6 feet thick. It has neither doors nor windows. Its purpose is not known.

PERIHELION (Gr. *peri*, and *hēlios*, the sun), that point in its orbit at which a planet is nearest the sun. The point of the orbit opposite to it is called the Aphelion (q. v.). The position of the perihelion, i. e., its longitude east or west of the equinox, is one of the seven elements of a planet's orbit.

PERIM, a small island belonging to Great Britain, situated in the strait of Bab-el-Mandeb, at the entrance to the Red Sea. Lat. of southern

point ($2^{\circ} 35' N.$, long. $47^{\circ} 12' E.$). It is $2\frac{1}{2}$ miles long by $2\frac{1}{2}$ broad; is about a mile distant from the Asiatic, and about 12 miles from the African coast. On both sides of this island, the navigation is easy; the little straits, between the island and Arakes, the passage most generally taken by vessels. The island is bare, destitute of fresh water, and ill-served with provisions, which are brought for the most part from Aden. P. owes its importance wholly to its commanding position. At the entrance of the Red Sea. On its south-west side is an excellent harbour, $1\frac{1}{2}$ miles in length and from a half to three-quarters of a mile in breadth. It is easy of access, 7 to 8 fathoms in depth, and is capable of accommodating forty men-of-war. Fortifications have been erected on the island since 1857, and the sea command the strait on both sides. It was first occupied by the English in 1709, and held by them as a check upon the designs of the French, who were then in Egypt. It was abandoned in 1802, but was reconquered by Great Britain, March 11, 1857, with a view to the protection of her Indian possessions, which were thought to be exposed to considerable danger from the opening of the Yamen Canal (q. v.).

PERIMETER (Gr. *peri*, around, *metron*, a measure; and **PERIPHERY** (Gr. *phero*, I carry) signifies denoting the boundary, or the length of the boundary, of any closed plane figure; though the term "perimeter" is generally confined to those figures which are bounded by straight lines.

PERIOD, a term used in Chronology in the same sense as Cycle (q. v.), to denote an interval of time during which the astronomical phenomena to which it refers return in the same order. It is also employed to signify a cycle of cycles. Various periods have been invented by astronomers, but we can only name a few of the most important.

The Chaldeans invented the *Chaldean Period*, or *Cycle of Belshazzar*, from observing that, after a certain number of revolutions of the moon round the earth, her eclipses occurred in the same order and at the same intervals. This period consists of 54 lunations, or 678428 days, and corresponds almost exactly to a complete revolution of the sun's node. The Egyptians made use of the *Dynastic, Sacrosanct, or Solar Period*, as it is variously called, to compare their civil year of 365 days with the true or Julian year of 365 $\frac{1}{4}$ days. The period consequently consisted of 1460 Julian years, corresponding to 1461 Egyptian years, after the lapse of which the days in both reckonings coincided. By comparing the solar and lunar years, Milton, an *Almagest*, invented (1602 A. C.) a lunar period of 6940 days called *luna* from the *Mohammedan Cycle* (q. v.), after the *Roman Cycle*. About a century afterwards, the cycle of Milton was discovered to be an insignificant overestimation by the truth, and as he had made the solar year too long by about $\frac{1}{10}$ th of a day, at the end of 4 Miltonic cycles the solar reckoning was in advance of the lunar by about 1 day 6 hours. To remedy this, a new period, called the *Calippic Period*, was invented by Calippus, and consisted of 4 *Mohammedan* cycles less by 1 day, or 27,758 days, but as this period still gave a difference of 6 hours between the solar and lunar reckoning, it was improved by Hipparchus, who invented the *Hipparchic Period* of 4 *Calippic* periods less by 1 day, or 111,048 days, or about 384 Julian years; which is an exceedingly close approximation, being only 6 minutes too long when measured by the *Julian year*; and too short but by an almost imperceptible quantity when measured by the *Ptolemaic* or *Solar* year. The period of the *Belshazzar* or *Solar Cycle*, after which the same

day of the month falls upon the same day of the week, consists of 28 Julian years. If the year has regularly consisted of 365 days, that is, one day more than an exact number of weeks, it is evident that, at the end of seven years, the days of the month and week would again correspond; but the introduction of an intercalary day into every fourth year causes this coincidence to occur at irregular periods of 6, 11, 5, and 5 years successively. However, by choosing a period, such as will preserve the *Julian year* in the same relative position to the other years, and at the same time consist of an exact number of weeks (both of which objects are effected by using the number 28, which is the least common multiple of 4 and 7), we have the regular recurrence of the coincidence between the days of the week and of the month. The solar cycle is supposed to have been invented about the time of the Council of Nice (325 A. D.), but it is arranged so that the first year of the first cycle corresponds to B. C. In calculating the position of any year in the solar cycle, care must be taken to allow for the coincidence of the intercalary day at the beginning of each century, and its insertion in the first year of every fourth century. See **LEAP YEAR**. The present year (1894) is the 25th of the solar cycle. The *Julian Period* is a cycle of cycles, and consists of $7550 (= 28 \times 19 \times 115)$ years, after the lapse of which the solar cycle, lunar cycle, and the *Indiction* (q. v.) commence together. The period of its commencement has been arranged so that it will expire at the same time as the other three periods from which it has been derived. The year 4713 B. C. is taken as the first year of the first period, consequently, 1 A. D. was the 4714th of it, and the present year (1894) the 6577th.

PERIODICAL, a publication which appears continuously at regular intervals, and whose contents may be devoted to criticism, politics, religion, literature, science, arts, amusement, or general and miscellaneous subjects. Those periodicals which consist of a collection of critical essays are called *Reviews*.

The earliest periodical in Great Britain seems to have been the *Philosophical Transactions of the Royal Society*, which first appeared in 1665, and contained notices of books as well as original papers. Periodicals professing to notice the books that were being published appeared soon after from time to time under the name of *All the Works of the Learned*; and in 1682 appeared the *Gentleman's Journal, or Monthly Miscellany*, properly speaking, the first English magazine. The *Gentleman's Magazine* was founded in 1731 by Cave the printer, a periodical which secured a fortune for its proprietor, and, after surviving all its competitors, still continues to flourish. The periodical literature of Scotland was long represented by the *Scots Magazine*, founded in 1739. The first English periodical that attempted anything like criticism was the *Monthly Review*, begun in 1749. It was followed in 1756 by the *Critical Review*, founded by Smollett; and these two were long the leading periodicals of their class, though their criticism was but meagre and unsatisfactory, according to our present notions. Another critical journal, called the *Anti-Jacobin*, was established in 1798. In 1802, a new era in criticism was inaugurated by the establishment in Scotland of the *Edinburgh Review* (q. v.); which was followed in London by the *Quarterly Review*, of about equal merit and opposite politics, supported by Sir Walter Scott, Bentham, S. T. Coleridge, Hobs, and at a later period by Hartley Coleridge, Lord Mahon, and Gladstone. Another very important periodical, *Blackwood's Magazine*, sprang up in Edinburgh in 1817, under the auspices of John Wilson and Lockhart, as much above the literary mark of former magazines, as the

Edinburgh and *Quarterly* were above the mark of preceding reviews, strongly devoted to the interests of conservatism, and, in its early years, somewhat violent in its politics. The review, in the course of time, became the favourite medium for all parties to disseminate their views on political, literary, or theological subjects. Among the most important periodicals of this class, besides the *Edinburgh* and *Quarterly*, are the *Westminster Review*, established 1824, characterised by freedom in handling philosophical and theological topics, and containing essays by J. S. Mill, Carlyle, Grote, John Sterling, and Lord Houghton; the *Dublin Review*, Roman Catholic, founded in 1836; the *North British Review*, which first appeared in Edinburgh in 1844; the *National Review*, which began in 1855; and the *Home and Foreign Review*, in 1862 (ceased to appear in 1864). All these periodicals preserve to a great extent the form of their two predecessors, and like them, appear four times in the year. A few reviews have of late appeared monthly, or even weekly: of this last class, the most widely-circulated and influential are the *Athenæum*, established in 1828, and the *Saturday Review*, in 1856. The management of a review is placed in the hands of an editor. Each article has at its head the title of a work or works, which either are directly the subject of the reviewer's criticism, or at least indicate the general subject of the article. Review articles are generally anonymous.

The greater part of magazines or periodicals of a more miscellaneous character appear monthly, and their system of management is somewhat similar to that of reviews; but the articles are generally shorter, the subjects more varied, consisting often of tales and novels, which appear there as serials, continued from number to number. Some of the most popular novels of the present day have first been published in magazines. *Blackwood* was the precursor of various monthly magazines of repute, the most important being *Fraser's Magazine*, established in 1830, which still preserves a high literary character. The usual price of these periodicals is 2s. 6d.; but in 1859 and 1860, several new magazines, *Macmillan's Magazine*, the *Cornhill*, *Temple Bar*, *London Society*, and the *St James's Magazine*, were started at the cheaper price of a shilling, under favourable auspices. In Great Britain there are now many weekly periodicals, chiefly of an instructive and amusing kind, price from a penny to three-pence each. This class of publications received an impetus and proper direction by the issue of *Chambers's Journal* and the *Penny Magazine* of the 'Society for the Diffusion of Useful Knowledge' in 1832. To the first mentioned, which still exists, have since been added *All the Year Round*, conducted by Charles Dickens, and various others enjoying a high degree of popularity. It is customary for the publishers of these weekly sheets to issue them accumulatively in parts monthly under a cover, wherefore they largely answer the purpose of monthly magazines. The rate of payment for writing in the higher class reviews is usually £10, 10s. per sheet of 16 demy 8vo pages; in the weekly periodicals, half a guinea to a guinea per column is ordinarily paid, but in some instances the price paid is very much greater; such particularly is the case as regards novels or stories, given chapter by chapter, through a series of numbers; for some tales in this form the payment amounts to hundreds, if not thousands of pounds—a striking proof of the eager demand for sensational fiction.

At present, there are in Britain about 82 quarterly periodicals, of which hardly more than 16 come under the common idea of a review; many are

devoted to special departments, literary, scientific, commercial, or theological; and some consist of an account of the transactions of particular societies, literary or scientific. About 400 periodicals are published monthly, and from 50 to 100 weekly.

France possessed as far back as 1665 a critical review called the *Journal des Savants*, which, after a lengthened interruption, began again in 1816, and holds a respectable position as a scientific journal. A number of literary and scientific journals sprang up in last century, as the *Nouveau Journal des Savants*, *Journal Littéraire*, *Journal Encyclopédique*, &c. Among the best was the *Magasin Encyclopédique*, begun in 1795, and from 1819 to 1831, combined with the *Revue Encyclopédique*. One of the most noted critical journals in Europe is published in Paris, the *Revue des Deux Mondes*, which began in 1829, and has, since 1831, appeared fortnightly. In it and the other French periodicals of the same kind, the review form is not so completely preserved as with us: a proportion of tales, poetry, &c., is admitted, and the names of the contributors are required to be attached to their articles. The *Revue des Deux Mondes* has had many shortlived imitators, more or less identified with different political parties. The principal French reviews of more recent date are the *Revue Contemporaine*, *Athénæum Français*, and *Revue d'Europe*.

In Germany, reviews have taken even a deeper root than in England. The *Göttinger Gelehrte Anzeige*, which is the oldest publication of the kind, still preserves a high character. German criticism can, however, hardly be said to have begun before the time of Lessing, who, in conjunction with Nicolai of Berlin, established, in 1757, the *Bibliothek der schönen Wissenschaften*, and afterwards various other journals, characterised by an independence of thought unknown before. The *Allgemeine Literaturzeitung*, founded at Jena in 1785, was a periodical of a still higher character, having for contributors the most eminent literary men of the period. When transferred from Jena to Halle, another journal, called the *Jenaische Allgemeine Literaturzeitung*, sprang up at the former place, under the auspices of the celebrated literary circle at Weimar, of whom Goethe was the centre. These two periodicals existed till 1848. Of modern German reviews, the *Literarische Centralblatt*, founded in 1850, is one of the best and most comprehensive. Among periodicals which do not come under the class of reviews, may be mentioned *Das Deutsche Museum* (1851), and *Das Weimarsche Jahrbuch für Deutsche Sprache, Literatur und Kunst*, may be favourably named.

Italy possessed a critical journal, *Giornale di Letterati*, as far back as 1710, conducted by Apostolo Zeno, which continued for 23 years. A new journal of the same name, founded at Pisa in 1771, attained considerable repute. From 1826 to 1830, the *Biblioteca Italiana* and *Antologia di Firenze*, were reviews of considerable ability. The scientific periodicals of Italy are generally creditable. In the dominions of Victor Emmanuel, there are at present 31 literary and scientific, and 10 miscellaneous periodicals.

The United States of America possess a large variety of periodicals, quarterly and monthly, and in a less degree weekly, issuing chiefly from the presses of Boston, New York, and Philadelphia. The most noted critical journal is the *North American Review*, established in 1815. It is to be mentioned with regret that, owing to the want of an international law of Copyright with the United Kingdom, many of the less reputable of the American periodicals systematically incorporate articles without permission or payment from the periodicals of Great Britain—a circumstance tending

materially to lower the general character of the publishing trade in the United States. Latterly, as is well known, many of the periodicals, both in Europe and America, have acquired an interest in the illustrations of wood-engravings, on the production of which large sums are expended by Messrs. Knapman.

PERIODICITY (in Physiology and Pathology). The tendency manifested by various phenomena occurring in living animals to come, after equal, or nearly equal intervals of time, in so marked, that almost the great French anatomist and physiologist, described it under the title of the *loi d'intervalle*. The alternation of sleep and waking, the phenomena of menstruation, and the periodical return of disease are some of the most obvious instances of periodicity that can be regarded as occurring in the healthy subject; while less obvious examples are afforded by the apparently regular variations that have been observed in the exertion of cardiac and liver the lungs, and in the number of the pulsations of the heart at different periods of the 24 hours. As is well known by experience, periodicity may be essentially catered and fixed in daily habits. This is well exemplified in the case of sleep, but in a more special degree by the daily reliving of the recollections of a particular hour, a habit in which it is important that all young persons should be carefully instructed, with a view to health and consequence.

In certain forms of disease, the law of periodicity is conspicuous in a very distinctly seen. The regular reoccurrence of the paroxysms of intermittent fever, for example, is universally known, although the cause of the periodicity has hitherto baffled all search. Almost those who have tried to solve this question may be mentioned Willis, Keil, Hall, Boerhaave, Cullen (who ascribed periodicity to 'a diurnal condition affecting the animal economy'), and more recently, Laycock, who refers it to the diurnal changes in changes in relation to pressure, also daily, &c.

There often gives rise to periodic diseases which present no close analogy to that disease. Thus it is in all events, malaria: at a frequent cause of its insidiousness, recurring at regular intervals; cases are recorded in which periodical vomiting, occurring weekly, or, in one case, at an interval of ten days, seemed to be due to it; and Mr. Moore, surgeon to the Middlesex Hospital, has recently published the case of a woman who experienced a periodical inflammatory swelling of the right knee, as a sequela of that disorder. Epilepsy is a disease in which the intervals (especially in women) tend to a regular period. Sir Henry Hallam (*Medical Notes and Discussions*, 51 ed., page 141) records a case in which 'six attacks occurred, with intervals of seven or eight weeks between; an exactly recurring, as noted by the watch, that it was impossible to suppose it a mere coincidence; and another, between a hæmorrhagic nature, more of tetanic than epileptic character, occurred twice a day for many weeks successively, and almost exactly at the same time each day.' For many other examples of periodic or intermittently repeated action, the reader is referred to a paper by Huxley, 'On the Cause and Continuity of Disease,' in the *Philosophical Transactions*, and to Sir Henry Hallam's essay (to which we have already referred) in the *Medical and Chirurgical Reviews*. The most important practical deduction to this class of diseases is, that they almost invariably yield to the action of certain remedies, especially bark and arsenic.

Observing a tendency to metastases influences, it may say for the habit of periodicity is to be not only shown in every instance likely to prove morbid or physically prejudicial. No more marked

example of the injudicious cultivation of periodicity could be given, than in the well practiced at periodical blood-letting, which was prevalent all over Europe, and was only abandoned in recent times as not only useless, but in all respects injurious.

PERIO'IA (Gr. *Periodos*, literally, 'a revolving round about'; i. e., round about some particular locality or edge) was the name given, in ancient Greece, to the original Achaean inhabitants of Laconia by their Dorian conquerors. The P. were not slaves, like the Helots (q. v.); they were merely a vassal population, personally free, cultivating their own ground, and carrying on most of the home and foreign trade of Laconia, but possessing no political rights, incapable of interfering with the Dorians of Sparta, or of holding important state-offices, and subjected to a land-tax in token of their dependent condition. They have been—as regards their political position—compared to the Normans of England since the Norman conquest, and indeed have a historical parallel even in detail. The P. must have been very numerous, for they supplied all the troops upwards of 100 cities, several of which were on the coast, whereas the whole kingdom of Laconia bore the name of the Perioeci, and they produced capital sailors, which doubtless accounts for the anomalous fact of P. being unusually invested with the command of the Spartan fleet. They also formed a part of the Spartan army. At the battle of Plataea (479 B.C.), there were 10,000 P. present. These dependent Achæans were not, however, all on a level of vassalage; they lived in regularly organized communities, where the social distinctions of rank, moment, and wealth were as marked as elsewhere. Xenophon speaks of 'accomplished and well-born gentlemen' (*kaloi kagathoi*) among the P. serving as colonists in the Spartan army; and such actors and men of culture as Lacedæmon produced, in all probability belonged to this class. P. also existed in the other Dorian communities of the Peloponnese.

PERIO'STEUM (Gr. *peri*, around, and *ostion*, bone), a tough fibrous membrane which surrounds the various bones. It is highly vascular, and is the means by which the outer layers of the shafts and the greater part of the spongy portions of the bones are supplied with blood. From the internal surface of the periosteum also is produced a layer of soft blastema (or plastic fluid in which cells are developed), by means of which, additions are made to the exterior of the growing bones. The process of ossification going on in the most part of this blastema, contributes to the thickness of the bone, while a fresh supply is continually being added to the exterior of the blastema, through the medium of the vessels of the periosteum.—Bamphrey *On the Human Skeleton*, page 19. In young bones, this membrane is thick, and in consequence of the intervening blastema, is very easily detached from the bone; but in the bones of the adult it is less thick and vascular, while its connection with the bone becomes closer, in consequence of the blastema being less; while in aged persons it is very thin, its vessels are scanty, and there is no blastema. Numerous experiments show that the formation of bone is essentially due to the action of this membrane; and that, by transplanting detached portions of periosteum into muscular or other tissues, bony tissue is generated in those parts. In most cases in which this membrane has become detached in consequence of a wound or of disease, the exposed bone (except in the instance of the skull, which derives most of its nutrient matter from the dura mater) perishes; but this is

not invariably the case. Amongst its other offices, it serves, by isolating the bone from the surrounding tissues, to prevent the spread of disease from them to it. The shin-bone or tibia is thus indebted to the periosteum for its ordinary immunity, in cases of ulcer in that region. In those parts in which the bone is not so completely isolated from the surrounding tissues, as at the ends of the bones of the fingers and toes, inflammation of the soft parts not unfrequently extends to the bony structure.

PERIOSTITIS, or INFLAMMATION OF THE PERIOSTEUM, generally occurs on the surface of thinly-covered bones, such as the tibia, clavicles, and cranial bones. Its chief causes are (1) a *syphilitic taint*, in which oval swellings, called *Nodes* (q. v.), are produced; (2) *rheumatism*; and (3) *scrofula*. In the two latter cases, there is a periosteal swelling around the whole circumference or surface of the bone. The affection, especially when due to the first or second of the above causes, is usually accompanied with considerable nocturnal pain. If the disease occurs in an acute form, it must be treated with leeches, fomentations, and the other ordinary antiphlogistic (or lowering) remedies. When it becomes chronic, the treatment must be mainly directed to the cause which has originated it. In almost all cases, the nocturnal pains are best relieved by somewhat large doses (five to ten grains) of iodide of potassium, taken three times a day on an empty stomach.

PERIPATETIC PHILOSOPHY, a designation of the philosophy of Aristotle (q. v.) and of his followers. It is of doubtful origin, being supposed to have been derived either from his custom of occasionally walking about (*peripatein*) during the delivery of his lectures, or from the place in which they were delivered having been a shaded walk of the Lyceum.

PERIPNEUMONIA, an inflammation of the membrane which invests the lungs, accompanied with general disturbance of the whole system; remarkably prevalent among horses in South Africa, in a zone from 20° to 27° S. lat. It is very fatal; and to its prevalence and virulence, Dr Livingstone is disposed to ascribe the fact that horses, although so abundant in the more northern parts of Africa, were unknown in the south till introduced by Europeans; this invisible barrier being more insurmountable than mountain ranges, deserts, or rivers. The season during which peripneumonia prevails is from December to April. Zebras, antelopes and oxen are liable to its attacks, but no kind of quadruped suffers so much from it as the horse. The flesh of animals which die of peripneumonia is unwholesome, and produces a malignant carbuncle in persons who eat it.

PERIPTERAL (Gr. *peri*, and *pteron*, a wing), a term applied to temples or like buildings having columns all round the cells.

PERISTALTIC MOTION. The terms *peristaltic* (Gr. *clasp* and *compressing*) and *vermicular* (or worm-like) are applied to the peculiar motion or action of the muscular coat of the intestines, by which the substances contained within it are regularly moved onward.

This action of the intestines is readily seen on opening an animal (a dog, cat, or rabbit, for example) immediately after it has been killed; and in these circumstances, it is perhaps exaggerated, from the stimulating action of the cold air; and it may be shewn in an abnormally active state, although not altered in character, by subjecting the exposed intestines to the influence of the electro-magnetic machine.

It appears, from the observations made by Brinton,

Todd and Bowman, and others on recently killed animals, that the peristaltic motion commences at the pyloric third of the stomach (see DIGESTION, ORGANS OF), whence successive waves of contraction and relaxation are propagated downwards throughout the whole length of the intestinal canal. In examining a portion of intestine at the moment of its contraction, we perceive a dilatation above it as well as below it; the latter being produced by the protrusion into it of the contents of the now contracted portion of intestine; the former by the relaxation of a previously contracted portion. The rapid succession of these contractions and relaxations gives to the movements of the intestines the appearance of the writhings of a worm, whence they are distinguished by the appellation *vermicular*.—Todd and Bowman's *Physical Anatomy of Man*, vol. ii. p. 236. These movements can occasionally be observed during life in the human subject, indirectly, in cases of extreme attenuation of the abdominal walls, and directly in wounds of the abdomen, and during certain surgical operations. There are differences of opinion as to the cause of the peristaltic action; thus, Todd and Bowman assert that 'the intestinal movements are partly due to the influence of the stimulus of distention upon the muscular tissue, and partly to the reflex action of the ganglia of the intestinal plexus of the sympathetic, stimulated by the contact of the intestinal contents with the mucous membrane,' while Carpenter maintains that 'the intestinal tube from the stomach to the rectum is not dependent upon the nervous centres either for its contractility or for its power of exercising it, but is enabled to propel its contents by its own inherent powers.'

Numerous observations tend to shew that this motion has a nearly definite velocity in each individual. Most commonly the act of defecation takes place with perfect regularity every 24 or (more rarely) every 12 hours, the quantity discharged being almost constant, if the mode of living does not vary. Heberden (*Commentarii*, p. 14) mentions a person who regularly had a motion once a month, and by way of contrast) another who had twelve motions every day during thirty years, and then seven every day for seven years, and rather grew fat than otherwise. Ponteau (*Œuvres Posthumes*, tome i. p. 27) records the case of a young lady who had no stool for upwards of eight years, although during the last year she ate abundantly of fruit, and drank coffee, milk, and tea, and broth with yolk of egg; but she had copious greasy sweats. Such a case as this is possible, but far from probable.

That the influence of *expectant attention* on the muscular movements of the intestine (and especially of its lower portion) is very great, is shewn in various ways. It is, for the most part, thus that *morbus* operates in producing a readiness for defecation at one special hour in the day, and that bread-pains and other equally inert substances act on the bowels, if the patient believes them to be purgatives. Dr Carpenter, in his remarks on 'the influence of expectant attention on muscular movements,' in the chapter of his *Human Physiology* treating of 'Muscular Movements,' mentions two very striking cases of the kind which have fallen within his own knowledge.

PERISTYLE, a colonnade around the interior of a courtyard or other building.

PERITONEUM (Gr. *periteinein*, to extend around), a serous membrane, and like all membranes of this class, a shut sac, which, however, in the female, is not completely closed, as the Fallopian tubes communicate with it by their free extremities. The peritoneum more or less completely invests all the viscera lying in the abdominal and

to be confounded by the well-educated practitioner is a peculiar form of hysteria; but the age and sex of the patient, the presence of hysteria in other forms, and the general history of the patient and of her symptoms, will almost always lead to a correct diagnosis of the disease.

The treatment, in an ordinary case of peritonitis (not arising from mechanical injury, or perforation from disease, or occurring in connection with puerperal fever), consists, if the patient is moderately robust, in bleeding from the arm, till a decided impression has been made on the circulation; after which the abdomen should be covered with twenty or thirty leeches, and the bleeding from their bites should be encouraged by fomenting the belly with flannels wrung out of hot water, or, if the patient can bear its weight, by the application of a light poultice. The system must, at the same time, be got as speedily as possible under the influence of mercury, by the means described in the treatment of Pericarditis (q. v.). Opium may be given freely, not merely to guard against the purgative action of the calomel, but with the view of securing sleep to the patient, and quiet to the inflamed membrane. The patient must be kept on low diet, unless indications of sinking appear. In peritonitis from perforation, the only remedy is opium, which must be given in large and repeated doses, so as to keep the bowels perfectly at rest, in order to promote the formation of adhesion, by which alone the patient can be possibly saved. For the same reason, perfect rest must also be insisted on, and even drinks forbidden, thirst being allayed by the application of ice to the tongue.

Chronic Peritonitis occurs in two forms, which differ in their origin and degree of fatality, but are very similar in their symptoms. In the first, the inflammation is of the ordinary character, and although the disease sometimes originates spontaneously, it is more frequently the sequel of an imperfectly cured acute attack; in the second, it depends upon granules (supposed by Louis and most writers to be tubercles) lying in countless numbers in the serous membrane, and serving as a constant source of irritation. The second form is confined almost, if not entirely, to persons of a scrofulous constitution.

The symptoms of chronic peritonitis are more obscure than those of the acute form. There is abdominal pain, often slight, and not always constant, which is increased by pressure, or sometimes is felt only when pressure is made. The patient complains of a sensation of fulness and tension of the belly, although its size is not visibly increased; of a loss of appetite; and of nausea and vomiting; and the bowels are usually more or less out of order. After a time, the abdomen enlarges, and becomes tympanitic, or more or less filled with fluid; and death gradually ensues from debility and emaciation, unless the fatal issue is accelerated by an acute inflammatory attack.

It is not always easy to determine, during life, whether the disease belongs to the first or second form. When its origin cannot be traced to a preceding acute attack, to local abdominal injury, or to chronic affections of the abdominal viscera, there is strong reason to believe it to be of the granular, or, as it is commonly called, the tubercular form, especially if the general constitution and the hereditary tendencies of the patient point in the same direction.

Little can be done in the way of treatment, especially in the tubercular form, further than mitigating the most distressing symptoms, and possibly retarding the final issue. The frequent application of a few leeches to the abdomen, followed

by warm poultices, occasional blisters, attention to the bowels, which, if costive, should be acted upon by gentle laxatives, and a mild, nourishing, but unstimulating diet, are more likely to be of service than remedies of a more energetic nature.

PERIWINKLE (*Littorina*), a genus of gasteropodous molluscs of the order *Pectinibranchiata* and family *Littorinidae*, having a proboscis-shaped head, a foot of moderate size, a single gill, and a rudimentary siphonal canal; the shell turbate, thick, with few whorls, and no nacreous lining; the operculum of few whorls. A very well-known species is the Common P. (*L. littorea*), a snail-like mollusc most abundant on rocky parts of the British coast, living in the lowest zone of sea-weeds between tide marks, and feeding on fuci, &c. It is oviparous. No mollusc is more generally collected and used for food. Children are generally employed in collecting it. It is boiled in the shell, and so sold, often on the streets, and chiefly to the poorer classes, although few molluscs are more pleasant. It is calculated that 1900 tons, value £15,000, are annually consumed in London alone. It is called *Wilk*, *Widd*, or *Whulk* in Scotland, but is quite different from the *Whulk* (q. v.) of the English, notwithstanding the sameness of name. Other species, *L. neritoides* and *L. rudis*, are common on all rocky parts of the British coasts, but are less esteemed. *L. rudis* is viviparous, and the shells of the young within the mantle of the parent often make it gritty and unpleasant to eat.

PERIWINKLE (*Vinca*), a genus of plants of the natural order *Apocynaceae*, having a 5-cleft calyx, and a salver-shaped corolla bearded at the throat, with five obliquely truncated segments. The leaves are opposite and evergreen; the flowers grow singly or in pairs from the axils of the leaves. The Lesser P. (*V. minor*), a native of many parts of Europe, and of the southern parts of Britain, growing in woods and thickets, is a half-shrubby plant with trailing stems, rooting at their extremities, ovate-lanceolate leaves, and pale-blue—sometimes white or reddish-purple—salver-shaped flowers. The Greater P. (*V. major*), which has much larger flowers and ovate-cordate ciliated leaves, is a native of the south of Europe, and is found in a few places in the south of England. Both of these species are very commonly planted in shrubberies and gardens, rapidly cover unsightly objects with pleasing green foliage, and produce their beautiful flowers at almost all seasons of the year, even in winter when the weather is mild. The Herbaceous P. (*V. herbacea*), a Hungarian species, is remarkable for the abundance of its flowers. The Yellow P. (*V. lutea*) is a native of the southern parts of North America. The Rose-coloured P. (*V. rosea*), a native of Madagascar, is a favourite greenhouse plant.—The name P. was formerly *Periwinké*. Chaucer speaks of the 'fresh perwinké rich of hue.' It is probably from the French *pervenche*, and that from the Latin *peris*.

PERJURY is the crime committed by one who, when giving evidence on oath as a witness in a court of justice, or before some constituted authority of the same kind, gives evidence which he knows to be false. But in order to make the giving of the false evidence liable to criminal punishment, it must have been not only false to the knowledge of the witness, but the matter must have been material to the issue raised. If the falsehood occurred as to some trifling or immaterial fact, no crime is committed. Moreover, it is necessary, in proving the crime, that at least two persons should be able to testify to the falsehood of the matter, so that there might be a majority of oaths on the matter—there being then two oaths to one. But this rule is satisfied though

PERMIN WARDROBE - PERMIAN, MAGNESIAN LIMESTONE

take witness to its not finally to any point. The power must also have taken place before some sort of official which had power to administer the law. The latter. Though in some courts affirmations are allowed instead of oaths, yet the punishment for false affirmation is still probably the same as for false swearing. The punishment for perjury was before the conquest, sometimes death or cutting out the tongue; but latterly, it was confined to fine and imprisonment, and at present the latter is the only punishment, with the addition of hard labour. The crime of subornation of Perjury, i. e., the procuring or procuring a person to give false evidence, is also punishable as a distinct offence.

PERMIN WARDROBE. See Entry VII.

PERMIA, the most eastern government of European Russia, is bounded on the E. by Siberia, and on the N., W., and S. by the governments of Volotska, Arkhangel, and Orenburg respectively. Area, 129,622 square miles—more than twice the size of England and Wales. Population, 2,317,945. It is divided by the Ural Mountains into two unequal parts, of which the smaller portion is on the western or European side of the mountains, although for administrative purposes it is reckoned as a part of European Russia. About three-fourths of the government are occupied by the Ural range, which in some places reaches the height of 4000 feet, but whose slopes are gradually toward the plain, that the traveller reaches their summit before he is aware that he has made any unusual ascent. About two-thirds of the entire surface, comprising all the western districts, are covered with forests, much of the area is in meadows and about the same extent is under cultivation. The main important rivers belong to the systems of the Volga and the Obi. The Kama, together with the Tselmissa and other affluents from the Ural Mountains, flow southward into the Volga, and thus form an important means of communication between the mining districts of E. and Europe. The Tara, the Isora, and the Kama communicate with the Obi; and rivers as spread up to the White Sea and the Arctic Ocean by the rivers Olenok and Petchora. The climate is healthy, though somewhat rigorous. At the end of July, the nights are cold; in the middle of September, falls the first snow. In November, when the whole face of nature is covered with snow, the transport of goods by sledges is begun carried on everywhere. In January, the cold becomes that sometimes freezes. At the end of March, the snow begins to melt, and before the middle of May, although the cold is still great, the country is clothed in the green of early spring. The chief products are gold, copper, magnesia, iron ore, rock crystal, Jasper, agate, quartz, porphyry, malachite, porcelain clay, salt (obtained from salt springs), coal, slate, marble, &c., and minerals in small quantities. The inhabitants are mostly Russians, but there are also numbers of Tartars, Magiards, and Finns. The agricultural produce of the government, consisting chiefly of cereals, rapeseed, flax, and hemp, is more than sufficient for local consumption, and is exported to some extent to the neighbouring governments. The immense forests of the country yield wood for fuel, and timber for the construction of the barges which, during summer, are floated down the rivers, freighted with the products of the mines. In 1851, the number of males and manufacturing in the government amounted to 1855, and employed 100,000 hands. Their produce amounted to 26,000,000 in value of which the value of the iron was 22,000,000, and that of copper and gold was 2200,000 each. Flax, also, is a staple mine, and good authority

to be the richest in the world. The iron of P. is famous over Europe. The commerce of the government is important. The sale of furs is, after that of Nijni-Novgorod, the most important in the Russian empire. The transit trade, however, is much more considerable than the local trade. The great highway from Siberia to European Russia passes through P., and the government communicates by means of the Volga, Petchora, and the Obi, with the Baltic, White, and Caspian Seas. The central administration of mines has its seat in Ekaterinburg.

The government of P. once formed a portion of the ancient Scythia, inhabited in the earliest historical times by Finnish tribes, and even they famous for the commerce which it carried on, especially with Asia. In the 11th c., it became connected commercially with the principality of Novgorod, which, little by little, conquered and took possession of the country. At the close of the 16th c., both it and Novgorod were annexed to the hereditary of the Princes of Moscow, and about the same time the Christian religion was introduced.

PERMIA, a town of European Russia, capital of the government of the same name, on the Kama, 1007 miles east-south-east of St Petersburg. It was founded in 1723, under the name of the Russian copper-works, and was the first colony in the government from which it derives its name. It is not in itself important for the commerce, but it is the seat of a most extensive transit trade. Heavy goods floated down the Tselmissa from the Ural Mountains, are transferred to larger vessels and forwarded by the Kama and Volga past Nijni-Novgorod and Rybinsk, and thence to St Petersburg. Goods from the sources of the Kama, marble, iron, tallow, and leather, as well as articles of the Siberian and China trade, are also sent from P. to the Russian interior and to Europe generally. At present (1854), a large and busy city is in process of being built by government. Pop. 15,472.

PERMIAN, MAGNESIAN LIMESTONE, or DIAS group, is the lower division of the New Red Sandstone rocks, which were separated, chiefly on palaeontological grounds, from the upper portion, and being, in 1851, without a collective name, were called Permian by Murchison, because he found them largely developed in that portion of Russia which composed the ancient kingdom of Perm, or Kormin. The name Magnesian limestone is given to them because of the predominant deposit; and Dias has been proposed by some German geologists, to correspond with Trias, the name universally accepted for the upper section of the New Red Sandstone series.

The Permian strata occupy in Russia an area twice the size of France, and contain an abundant and varied suite of fossils. They are also largely developed in Germany, and as they have been there carefully studied, and described by numerous geologists, the rocks of that country may be considered as the types of the group. They have been there grouped: 1. Bunteraschiefer, 2. Zechstein, 3. Kupferschiefer or Mergel, 4. Roth-tuffsteine.

The Bunteraschiefer consists of red and mottled sand and sandstone, which have been separated from the Triassic Bunter Sandstein, because of the occurrences in them of fossils which have a palaeozoic facies. The Zechstein is chiefly a compact limestone with beds of coloured clays, and cellular magnesian limestone. The well-known Stinkstein belongs to this series; it is a dark-coloured and highly bituminous limestone, which gives out an offensive odour when struck or rubbed. The name Zechstein (literally, mine-stone) was given to these

beds, because they must be mined or cut through to reach the Kupferschiefer below. This latter is a marl slate, richly impregnated with copper pyrites, for which it was extensively wrought. It contains numerous beautifully preserved fossil fish belonging to the genera *Palæoniscus*, *Cælacanthus*, *Platysorus*, &c. The strange name of *Rothe-todtliegende* (red dead-layers) was given to a large deposit of red sandstone and conglomerate, by the miners, because the copper obtained from the beds above died out when they reached these red rocks.

The succession of rocks given by Murchison as occurring in Permian, are easily co-related with those of Germany. They are (1), conglomerates and sandstones, containing the remains of plants; (2), red sandstones and shales, with copper ore and vegetable remains; and (3), sandstones, grits, and fossiliferous limestones, with interstratified beds of marl and gypsum, the marls occasionally containing plants, and also seams of impure coal.

In England, the Permian rocks are somewhat extensively developed in Durham, where they have been described by Sedgwick and King. From this county, they continue in a narrow strip bordering the Carboniferous beds down the centre of England, until they are lost near Nottingham. In Cheshire, Shropshire, Stafford, and Warwick, they underlie the salt-bearing triassic rocks. The Durham strata are grouped as follow:

- | | |
|--|-------------------------|
| 1. Concretionary and amorphous limestone, . . . | } = Bunterschiefer. |
| 2. Brecciated and pseudo-brecciated limestone, . . . | |
| 3. Fossiliferous limestone, . . . | } = Zechstein. |
| 4. Compact limestone, . . . | |
| 5. Marl slab, . . . | } = Kupferschiefer. |
| Inferior various-coloured sandstone, . . . | |
| | } = Rothe-todtliegende. |
| | |

The fractured bones and teeth of saurians found in the basement bed of the sixth group, were considered the earliest evidence of the existence of reptiles, until the discovery of the *Archegosaurus* in the Carboniferous rocks.

The known organic remains of this period are neither remarkable nor abundant. Many palæozoic forms became extinct within this period; among them are the remarkable *Sigillaria* and the *Neuropteris* of the coal-beds, the well-known *brachiopod*, *Producta*, and several genera of heterocercal-tailed fish. Some new forms appear, the most important of which are the labyrinthodont reptiles, which, though beginning in the upper Carboniferous beds, increase in number in the Permian, and reach their maximum development in the succeeding Triassic group.

PERMUTATIONS AND COMBINATIONS.

A combination, in Mathematics, is a selection of a number of objects from a given set of objects, without any regard to the order in which they are placed. The objects are called elements, and the combinations are divided into classes, according to the number of elements in each. Let the given elements be the four letters *a, b, c, d*; let the binary combinations, or selections of two, are *ab, ac, ad, bc, bd, cd*—six in all, the combinations of three are *abc, abd, acd, bcd*—four in all; while there is only one combination of four, namely, *abcd*.

Permutation, again, has reference to the order of arrangement; thus, the two elements, *a* and *b*, may stand *ab* or *ba*, so that every combination of two gives two permutations; the three elements, *a, b*, and *c*, may stand *abc, acb, bac, bca, cab, cba*, one combination of three thus affording six permutations. The combinations of any order with all their permutations are called the *Variations*. Formulas are given in works of algebra for calculating the

number of permutations or combinations in any given case. Suppose seven lottery-tickets marked 1, 2, 3, to 7, and that two are to be drawn; if it is asked, how many possible pairs of numbers there are, this is a question of the number of combinations of seven elements, two together, which is found to be 21. If we want to know how many times the same seven persons could sit down to table together with a different arrangement each time, this is to ask how many permutations seven objects admit of, and the formula gives, $7 \times 6 \times 5 \times 4 \times 3 \times 2 = 5040$. The theory of probabilities is founded on the laws of combination. Thus, in the case of drawing two tickets out of seven, since there are 21 possible pairs, the chance or probability of drawing any particular pair is 1 in 21, or $\frac{1}{21}$. In working out questions in 'combinations,' advantage is often taken of the fact that whatever number of elements be taken from a group to form a combination, the number left gives the same number of combinations; thus the number of combinations of 10 elements three together, is the same as that of 10 elements seven together, &c.

PERN. See HONEY BUZZARD.

PERNAMBUCO, the most eastern seaport of Brazil, stands at the mouths of the Biberibe and Capeberibe, in lat. $8^{\circ} 4' S$, long. $34^{\circ} 52' W$, 80 miles south of Parahiba. It is the greatest sugar-mart in Brazil, and is the third in commercial importance of the cities of the empire. It consists of three portions, connected by roads and bridges—*Recife*, the chief seat of commerce, on a peninsula; *S. Antonio*, the middle district, on an island between the peninsula and the mainland; and *Boa Vista*, on the mainland. The inner harbour, which has a depth of from 10 to 30 feet, is formed by a reef which extends along the coast at a distance of from a quarter to half a mile from the coast. This reef serves the purposes of a breakwater. Opposite the northern extremity of the city, there is an opening in the reef, resembling an artificial cut, and forming a passage of sufficient width to admit of the entrance of vessels drawing 16 feet of water. No port is more easily accessible than the outer harbour of Pernambuco. There is a light-house in the harbour, and it is defended by several forts. Formerly, the city was extremely dirty, the streets unpaved, and much inconvenience was suffered from want of a proper supply of water. Of late years, however, many improvements have been introduced; water-works have been erected, extensive and spacious quays formed along the margins of the rivers, and the streets have, in most instances, been paved and lighted. Numerous colleges and other educational institutions have been established, and the growing wealth and commercial prosperity of the city has been accompanied by an increasing degree of comfort and refinement. The principal exports are sugar, cotton, rum, hides, and dye-woods. In 1859, 654,642 tons of sugar were exported. The imports are woollen and cotton cloths, hardware, silks, wines, and flour. Pop. from 80,000 to 100,000.

PERNAMBUCO, a maritime province of Brazil, is bounded on the south-east by Bahia and Alagoas, and on the north-west by Piauí, Ceará, and Parahiba. It contains 61,068 square miles and has a population of 950,000. The coast is flat, and fringed with coral reefs, which render navigation dangerous. The chief river is the San Francisco, which forms the southern boundary, and includes the greater portion of the area of the province in its basin. The banks of this river comprise many rich, expansive meadows, and here the cattle are reared which, in the form of beef and hides, form an important article of export at the

PERNAMBUCO WOOD—PERPENDICULAR FORTIFICATION.

aspect of Pernambuco. Much of the cotton and sugar brought to the market of this capital is produced about 250 miles inland in regions fertilized by streams that rise at the base of the Santa Inez-da-Mata, the first hills in the district that guards the trade-wind from the Atlantic, below which rain. From the capital to Joazeiro, a distance of about 400 miles, across a district covered with valuable sugar-plantations, a railway was in course of construction in 1891. The province contains immense tracts of rice and cereals and, productive in sugar cane, cotton, maize, fruits, vegetables, and medicinal herbs. From the forests, balsamic gums and dye-woods are obtained.

PERNAMBUCO WOOD. See BRASSI WOOD.

PERNOW (*Perne*, *Perne*), a square of the latter Province, Alagoas, in the government of Pernambuco, stands on a sandy bank at the mouth of a river of the same name, on the Gulf of Baya, 102 miles north of the port of Baya, and 230 miles from the coast of St. Petersburg by sea. The mouth of the river is so shallow that large vessels are obliged to anchor in the shoals. The exports are chiefly rice, sugar, corn, and timber; the principal exports are silk and iron-ore. In 1891, 234 vessels, of 27,250 tons, entered and cleared the port. Pop. 1891.

PERPENDICULAR. A straight line standing in another straight line is said to be perpendicular to that other when the angles it makes on both sides are equal (see ANGLE). A line is said to be perpendicular to a plane when it is at right angles to any line in that plane meeting it. Planes are said to be perpendicular to each other when any line in the one plane perpendicular to their common line of intersection is also perpendicular to all lines meeting it in the other plane.

The word 'perpendicular' is common usage, refers to a direction at right angles to the surface of still water, and is synonymous with vertical.

PERPENDICULAR, the name given to the style of Gothic architecture in England which succeeded the Decorated style. It prevailed from about the end of the 14th c. to the middle of the 16th c., and was then contemporary with the Flemish style. These styles have much in common, but they derive their names from the features peculiar to each. Thus the Flemish style (q.v.) is distinguished by the flowing lines of its tracery; while the Perpendicular is remarkable for its stiff and upright lines. The lines of the window, doorway, and spire, and the mullions are frequently crossed by horizontal bars. The mouldings are usually thin and hard. The main feeling peculiar to the other features of the style, the buttresses, piers, towers, &c., are all drawn up and diminished, and present in their shallow recesses and narrow lines a great contrast to the deep arches and bold mouldings of the earlier styles. The art of masonry was well understood during the Perpendicular period, and the vaulting was admirable. Fan-vaulting (q.v.) belongs to this style. The depressed or four-centre arch is another of its peculiar features. This arch, ever afterwards, has the mouldings generally arranged in a square form over the arch, with spirals containing circles, ovals, &c. Paving was also much used, the walls being frequently almost entirely covered with it, as in Henry VII.'s Chapel at Westminster. There are many well-known buildings in this style. Most of the colleges at Oxford and Cambridge belong to it, and in almost every cathedral and church of importance, there are some specimens of it. Open timber-roofs are

very common in the Perpendicular style, and are amongst the peculiar and beautiful features of the

Nave of Winchester Cathedral.

architecture of this country. The roof of Westminster Hall, built by Richard II., is the largest example ever erected.

PERPENDICULAR FORTIFICATION owes its origin to the Marquis de Montalembert, a distinguished French general, who published his work upon the subject in 1776. Vauban had, it was admitted, rendered the art of attack superior to that of defence. Montalembert strove to reverse this relation, and, in his endeavours, rejected entirely the bastion system of the older engineers. Instead of the rounded bastions, with intervening curtains (see FORTIFICATION), with which they surrounded their *carrière*, he broke the whole polygon into salient and re-entrant angles, the latter being generally right angles. Before the connected redans thus formed were counter-escarpments of low elevation and ravelins, to which the approaches were through casemated passages. In the salient angle of each redan, he built a cyclic tower, 40 feet in diameter, twelve-sided, and four stories high. The second and third tiers were built for heavy guns, and the upper belonged to musketry. In the centre of the tower was a circular *réduit*, intended as a last refuge for the garrison. Montalembert maintained that from

these towers every possible approach could be commanded, which to a great extent is true; but it must be also remembered that the greater space a gun commands, by so much the more is it raised above the plain, and rendered visible. These towers would have little chance against the rifled ordnance of the present day. Montalembert's system was violently attacked by the French engineers, but Carnot subsequently adopted it, with some modifications, and it enters largely into the modern German defensive works. The system has never, however, found favour with British engineers.

PERPETUAL CURE, a form of ecclesiastical benefice which grew out of the abuse of lay Impropriation (q. v.), the impropriator appointing a clergyman to discharge the spiritual functions of which he himself was not capable. The substituted clergyman, in ordinary cases, is appointed by the bishop, and called a vicar; but when no provision is made for a vicar, the impropriator appoints the clergyman, who is called a perpetual curate. The perpetual curate enters on his office without induction or institution, and requires only the bishop's licence. Perpetual cures are also created by the erection and endowment of a chapel subject to the principal church of a parish. Such cures, however, are not benefices, unless endowed out of the fund called Queen Anne's Bounty. Churches so endowed are, by 2 and 3 Vict. c. 49, recognised as benefices. The district churches which have been erected under several recent acts are made perpetual cures, and their incumbents are corporations.

PERPETUAL MOTION, THE. According to Newton's First Law (see MOTION, LAWS OF), all unresisted motion continues for ever unchanged. Thus, *if friction could be avoided*, a top or a gyroscope spinning in vacuo is an instance of motion which would be unchanged for ever, and which, therefore, might be called perpetual. The motion of the sun in space, the earth's rotation about its axis, and numerous other common motions, are in this popular sense perpetual. [It is necessary to remark here, that even these motions are subject to retardation; for instance, those of the bodies of the solar system, by the resistance of the luminiferous medium, which we know to be matter, and which fills all space. This was remarked by Newton himself, for he says, 'the larger bodies, planets and comets, preserve their motions longer (than terrestrial objects), because they move in less resisting media.' The same cause influences the motion of the gyroscope, but in its case there is another retarding influence at work, due to the production of electric currents by the magnetism of the earth.] But this is not what is technically understood by the title *The Perpetual Motion*. It means an engine which, without any supply of power from without, can not only maintain its own motion for ever, or as long as its materials last, but can also be applied to drive machinery, and therefore to do external work. In other words, it means a device for creating power or energy without corresponding expenditure. This is now known to be absolutely impossible, no matter what physical forces be employed. In fact, the modern physical axiom, the Conservation of Energy, (see FORCE), founded on experimental basis as certain as those which convince us of the truth of the Laws of Motion, may be expressed, in the negative, thus: *The perpetual motion is impossible*. Helmholtz's beautiful investigations regarding Conservation of Energy (referred to in FORCE), are founded on this axiom. So is the recent application, by Clausius, of Carnot's remarkable investigation of the 'Motive-power of Fire' to the true Theory of Heat. Other instances will be mentioned at the end of the article.

The complete statement of the impossibility of procuring the perpetual motion with the ordinary mechanical arrangements, in which it was most commonly sought, is to be found in the *Principia* (q. v.), as a deduction from Newton's Third Law of Motion. The equivalent principle of Conservation of Energy is there stated in a manner which leaves nothing to be desired; although not given in anything like the modern phraseology. Yet it is usually said, in works on the Perpetual Motion, that De La Hire (in 1678) gave the first proof of its impossibility in ordinary mechanics. This proof, published long after Newton's, is by no means so complete, as it exposes only some of the more patent absurdities which had been propounded for the solution of the problem. It is certain, and worthy of particular notice, that Newton was far in advance of the greatest of his contemporaries and their immediate successors, in even the fundamental notions of mechanics. Thus, we find John Bernoulli seriously propounding a form of the perpetual motion, depending upon the alternate mixture, and separation by a filter, of two liquids of different densities; an arrangement which is as preposterous as the very common suggestion of a water-wheel which should pump up its own supply of water; and whose absurdity must be evident to any one acquainted with Newton's chapter on the Laws of Motion.

It is curious that, long before Newton's time, the physical axiom, that the perpetual motion is impossible, was assumed by Stevinus as a foundation for the science of Statics. This is particularly interesting when we compare it with the magnificent discoveries which have been evolved in our own day from the same principle applied to the physical forces generally, and not to gravitation alone, as contemplated by Stevinus. His process is as follows: Let an endless chain of uniform weight be passed round a smooth triangular prism ABC, of which the face BC is horizontal. The free portion of the chain BDC will hang in a symmetrical curve (CATENARY, q. v.), and its tension will therefore be the same at B and at C. Hence the other portion BAC of the chain will be free to move, unless the resolved part of the weight of AB, acting down the inclined plane AB, just balance that of the corresponding portion of the chain down AC. If these balance, the parallelogram of forces is proved; if not, one side will preponderate, and we shall evidently obtain the perpetual motion.

We will briefly sketch the history of the simpler part of the problem, where mechanical and hydrostatical arrangements alone are contemplated, and where the impossibility of procuring the perpetual motion had been completely shewn by Newton.

The leading features of the various devices suggested as self-moving engines are three: 1. The machine being a combination of mechanical powers driven by weights, was to be constructed so as constantly to wind up those weights as they fell, and therefore to be constantly in the same circumstances as to power in each successive complete revolution. The ideal of this, in its simplest form, is that of a wheel moving about a horizontal axis, and so adjusting certain heavy sliding pieces on its surface, as to have always a preponderance on one particular side. 2. The type of the second class differs from that of the first only in the substitution of liquids for the weights in the first class, and the consequent introduction (often in most extravagant forms) of

PERPETUAL MOTION.

hydrostatical laws, which the inventors seem to have considered less certain and more pliable than the stern facts of common mechanics. 3. The machine depends on some natural power, such as rain, change of temperature, wind, fluctuations of the barometer, &c. The consideration of this third class is very interesting, but we will defer it for a little.

Of the first class, the only machines that seem ever to have succeeded in permanently deceiving any but their inventors are those of the Marquis of Worcester and of Councillor Orffyreus. Contemporary with the former was Bishop Wilkins, who candidly and ingeniously points out the fallacies of various devices of his own, depending severally on weights, on magnets, and on Archimedes's screw. His first attempt seems to have been closely allied to that of the Marquis of Worcester, of whose engine we have no drawing, and only a very vague description. The following figures give us, however, some

In all three, the attempt is by the sliding of the balls in their cells, or by the turning of the levers to give the preponderance to the descending side of

Bishop Wilkins's First Form.

notion of its probable nature. The first is one of Wilkins's, the second that of Jackson, the third that

Jackson's Perpetual Motion.

of Merlin. Their construction is evident from the figures.

Merlin's Perpetual Motion.

the wheel. But even the cuts shew that, though the weights on the descending side are on the whole further from the axis of the wheel than those on the ascending side, yet there are more balls on the latter than on the former side; and a careful examination, like that made by Wilkins, shews that their moments in opposite directions about the axis balance each other. With reference to the invention of the Marquis of Worcester—who is otherwise well known as one of the first to foresee, and even in part to realise experimentally, the advantage of steam as a motive-power—we find the following in his *Century of Inventions*: ‘*An Advantageous Change of Centers.*—To provide and make that all y^e weights of y^e descending syde of a wheele shal be perpetually further from y^e center, then those of y^e mounting syde, and yett equal in number and heft of y^e one syde as y^e other. A most incredible thing if not seene, butt tryed before y^e late King of happy and glorious memorye in y^e Tower by my directions, two Extraordinary Embassadors accompanying his Ma^{ty} and y^e D. of Richmond, D. Hamilton, and most part of y^e Court attending him. The wheele was 14 foote ouer, and 40 weights of 50 p^l apiece; Sr Wm. Belford, then Lieu^t of y^e Tower, and yett liuing can justify it with seuerall others; They all saw that noe sooner these great weights passed y^e Diameter Line of y^e vpper syde but they hung a foote further from y^e center, nor no sooner passed the Diameter Line of the lower syde, butt they hung a foote nearer; bee pleased to judge y^e consequence.”

The machine of Orffyreus, by which 'S Gravesande was completely taken in, so much so that he wrote to Newton expressing his belief that the perpetual motion was really found, consisted of a large wheel or drum covered with canvas, to prevent the interior from being seen, and rotating about a thick horizontal axle. This machine, when set agoing in either direction, moved with accelerated speed till it reached a rate of twenty-five turns in a minute; and on one occasion was sealed up by the Elector of Cassel for two months, and at the expiration of that time found to be moving as rapidly as ever. This, like the celebrated automaton chess-player, was evidently a case of clever imposition; and but for its strange effect

* See Harleian MS., No. 2428, in the British Museum.

PERPETUAL MOTION.

on 'S Gravesande, would probably have been forgotten long ago. Tricks of this kind, more or less ingenious, such as that of Spence of Linlithgow (1818), which many of our readers may recollect, are still common, especially in America.

Bishop Wilkins's third form is a good example of the second class of contrivances above mentioned. Its construction will be readily understood

Bishop Wilkins's Third Form.

from the annexed cut. The water-wheels, driven by the descending water, are intended to turn the Archimedeian screw, so as constantly to replenish the tank above. Wilkins's calm investigation of the reasons why his device will not succeed, is very interesting and creditable.

As a contrast, let us take a case of special absurdity, that of Norwood. In the figure, it is supposed that, as the weight of the water or

Norwood's Perpetual Motion.

mercury in the large vessel immensely exceeds that in the neck, it will preponderate, and drive the liquid through the spout into the vessel again; thereby furnishing, not only an admirable perpetual motion, but a conclusive disproof of one of the fundamental laws of Hydrostatics.

The second of Wilkins's cases is an instructive one. It depends on magnetism, and will be readily understood from the cut. AB is a loadstone, which draws the iron ball C up the inclined plane to E, where there is a hole through which the ball falls down the curved incline, pushes open a trap at F, and is dragged again up the plane by the loadstone. The error of this is the neglect of the action of the loadstone on the falling ball. There would be an admirable case of the perpetual motion if we could

remove or annihilate (without expenditure of work) the action of the loadstone during the descent. Unfortunately, the law of magnetic attraction is the

Bishop Wilkins's Second Form.

same as that of gravitation, and what is impossible with the one, must be equally so with the other. A good illustration of this is Addeley's Perpetual Motion, represented in the annexed sketch. The spokes projecting from the wheel are magnets, whose south poles are all turned from the centre. These are attracted by the north poles (N), and

Addeley's Perpetual Motion.

repelled by the south poles (S) of four fixed magnets; and blocks of wood (A) are interposed, to prevent magnetic action where it would tend to stop the machine! If it were possible to find a substance which would deal with gravitation or magnetism as an opaque body does with light (casting a shadow), the perpetual motion would be obtained with the greatest ease.

It would be tedious and unprofitable to go through the various physical forces, shewing how a misconception of their laws has led to hundreds of patented schemes for the production of perpetual motion. We may merely hint at magneto-electric machines turned by electro-magnetic engines, to which they supply the electric currents; electric machines, driven by a gas-engine, the fuel for which is supplied by the decomposition of water by the electricity produced, &c.; the absurdity of all of which may be imagined from the perfectly analogous case of a steam-engine to which heat might be supposed to

be supplied by the friction of bodies driven by the same itself. An excellent example of this absurdity is furnished by the writings of one of our latest poets. He considers that the internal heat of the earth may be due to chemical combination, that this heat as produced may develop thermoelectric currents, and that these in their turn may develop new chemical forces, so that the process may go on indefinitely.

But the third class of attempts above described merits a few words. It certainly does not give the perpetual motion, but it is capable of furnishing power-motors which will work uninterruptedly for centuries hundreds of thousands of years. This is heat, however, as we should expect, at the expense of other forms of energy in the universe. Thus, the steam, wind, or tidal engine, a distillated but most effective source of power, derives its energy entirely from the earth's diurnal rotation. Engines driven by collected rain-water, such as mill-wheels, &c., and others driven by power stored up from winds, &c., depend upon energy radiated from the sun, mostly in the form of heat. None of these are, therefore, in strictness, to be called the perpetual motion, since the energy of the earth's rotation, or of the sun's heat, is drawn upon to their production.

But the complete proof of the impossibility of producing the perpetual motion by any arrangement whatever, involving any known force, was arrived at nearly by the experiments of Joule (q. v.), who showed that the principle of the Conservation of Energy extends not alone to the forces for which it was formulated by Newton, but to every known form of physical action. The date 1840-1845 may thus be said to have finally settled this long-debated question; at all events, null new forms of physical forces may happen to be discovered; and we are now in a position to be generally, what was wisely done by the French Academy in 1775 for ordinary mechanical contrivances alone—viz., refuse to consider any scheme whatever which pretends to give work without corresponding and equivalent expenditure. The language in which this decision of the French Academy is recorded (*Histoire de l'Académie*, 1775) is well worthy of being quoted, for its calm scientific clearness and brevity, and for its present applicability to physical science in general: "The construction of a perpetual motion is impossible. From if the effect of the motive power was not in the long run destroyed by friction and the resistance of the medium in which the motion takes place, this power could produce merely an effect equivalent to itself. In order, therefore, to produce a perpetual effect from a finite cause, that effect must, to infinitely small in any finite time, diminish friction and resistance, a body to which motion has been given will retain it for ever; but not on condition of its not acting on other bodies, and the only perpetual motion possible, on this supposition (which, besides, cannot occur in nature), would be useless for the object which the devisers of perpetual motions have in view. This species of reasoning, from the consequences of being costly; if not named many a faculty; and numerous mechanists, who might have done great service, have wasted on a chimeric dream, their time, and their talents."

These are the principal motives which have led the Academy to its decision. In concluding that it will no longer notice such speculations, it simply declares its opinion of the uselessness of the labours of those who are devoted to them.

It has been asserted that the misstatement of the supposed mechanism, what we may be seen by a glance at the speculations of patents in Britain, France, Belgium, America, &c.) are perhaps more numerous, more than ever in time in two causes—

one, the idea that the perpetual motion is a lost but recoverable invention; the other, that some immense pecuniary reward has been for years laid aside for the successful discoverer. But, naturally, these ideas are as fallacious as the grand delusion itself; and any one who, in the present state of science, allows himself to be carried away by this fascinating inquiry, loses his time and wastes his talents, more hopelessly than even a "squatter of the tropic."

In conclusion, we may mention a few of the cases already noted in which the impossibility of the perpetual motion formed the basis of an investigation. These will show the great use which may be made of even a negative proposition. Helmholtz has shown from it that the ultimate particles of matter must exert upon each other forces, whose direction is that of the line joining each pair of particles and whose magnitude depends solely on their distance. J. Thomson employed it to show that the freezing-point of water is lowered by pressure, as otherwise work might be created by the freezing of ice-cold water. W. Thomson has employed it to show that a diamagnetic (non-ferromagnetic) body does not take the opposite magnetism to iron, when in similar circumstances; for if it did, and if, like iron, it took time for the full development of the action, a perpetual motion might be produced.

The literature of this subject is very extensive, but scattered mainly through Patent records and ephemeral pamphlets. *The Journal des Savants*, and Montucla's *Histoire des Mathématiques* may be consulted; but especially we would refer the curious reader to a recent work by Mr. Decker (of Patent Office notoriety) entitled *Perpetuum Mobile* (London, 1861), to which we have been indebted for some of our historical notices. The tenor of the work is such that we cannot easily discover whether the author is a perpetual-motomist or not; but, however this may be, it is extremely complete and interesting as a history.

PERPETUITIES, LAW AGAINST, consists in a rule adopted in England to the effect that property cannot be tied up for a period longer than the lives of some parties already in existence, and 21 years more. Those who have the power of disposing of their property have often attempted to regulate the succession of their estate at distant periods. Such was the object of the original practice of entailing property, and so entering the devolution of property on a certain series of heirs to the remotest generations. This power of testation was always looked upon with jealousy, as tending to embarrass future dealings with the property, and frustrate the purposes for which property is established. So early as the reign of Edward IV., a decision was given by the courts in *Taltarum's case*, which had the effect of allowing the first tenant in tail in remainder, on arriving at majority, to disentail the estate at discretion. Hence, in England, there has been ever since no mode of settling property in any way so as to tie it up beyond the life of the first who takes an estate of freehold, and the tenure of the tenant in tail next in remainder—i. e., the lives of persons in existence, and 21 years more. This principle applies not only to land, but to personal property. As to the accumulation of the income of property, an attempt was made by the late Mr. Thellouss to create an immense fortune by directing the income of his property to be accumulated during the lives of all his children, grandchildren, and great-grandchildren, who were living at the time of his death, for the benefit of some future descendants, to be living at the death of the survivor. The probable amount of the accumulated fund was expected to be 10 millions. The will was in great measure

defeated by the existing law, but in consequence of so conspicuous an attempt, an act of parliament was passed, called the Thellusson Act (39 and 40 Geo. III. c. 98), which in future forbids the accumulation of income for any longer time than the life of the grantor or settler, or 21 years from his death. In Scotland, so far from the above doctrines having been early adopted, the contrary doctrine was established. See ENTAIL.

PERPIGNAN, a town of France, and a fortress of the first rank, capital of the department of Pyrénées-Orientales, on the right bank of the river Tet, 5 miles from the Mediterranean, and 40 miles by railway south of Narbonne. It commands the passage by the Eastern Pyrenees from Spain into France, and is defended on the south by a citadel and by ramparts flanked with bastions, and protected by raised works. The works underwent a thorough repair in 1823, and P. now ranks as one of the first strongholds in France. Its appearance is exceedingly picturesque. From a distance, its houses are seen in the midst of a forest of orchards; and a closer examination shews a collection of narrow streets, covered with awnings; houses of semi-Moresque construction, with wooden balconies and courts, and other evidences of Spanish influence. The cathedral, a massive building, begun in 1324; the belfry of St Jacques and the Castiller (now used as a military prison), with its battlements and machicolations, give character to the town. P. contains barracks for 5000 men, a council-house, palace of justice, mint, a college, numerous schools, museums, and scientific societies. Good *vin ordinaire* (red) is grown in the vicinity; woollen cloths, playing-cards, leather, &c., are manufactured, and there is a good trade in wine, brandy, wool, and silk. Pop. 18,199.

P., as capital of the former county of Roussillon, remained long in the hands of the kings of Aragon, and in 1349, King Pedro founded a university here. In 1642, it was taken by Louis XIII.; and since that time, the town itself, together with the county of Roussillon, has remained in the possession of the French.

PERRAULT, CHARLES, a French writer, born at Paris, 12th January 1628, was the son of an advocate, and received a good education. In 1651, he became a member of the Paris bar, and obtained a considerable measure of success as a pleader; but having made the acquaintance of the minister Colbert, he was ere long diverted from the practice of his profession by receiving the appointment of Controller-general of the Royal Buildings. In 1671, the influence of Colbert procured for him an entrance into the French Academy, into which learned body he introduced several important reforms. What first made his name well known was his famous controversy with Boileau regarding the comparative merits of the ancients and moderns, which originated in a poem of P.'s, entitled *Le Siècle de Louis le Grand*, read before his confrères of the Academy, and intended to prove that modern authors were superior to Homer, Herodotus, Plato, Aristotle, Virgil, &c. It was followed up by an elaborate and methodically written *Parallèle des Anciens et des Modernes* (4 vols. 1683—1698), which, though an able and learned performance, is a complete failure in its logic. Boileau was his keenest opponent, and fiercely, not to say rudely, assailed him in his *Réflexions sur Longin*, to which P. replied with equal acrimony, but not with equal wit, in his *Apologie des Femmes* (1694). One good effect of this quarrel was to turn P.'s attention still more closely and critically to his contemporaries, the result of which was an admirable work, *Hommes*

Illustres du Siècle de Louis XIV., containing 240 critical biographies. But the work that has far more than any other preserved his name is his *Contes des Fées*, or Fairy Tales. See NOVELS. The grace, liveliness, and ingenious child-like fancy displayed in these charming compositions, are beyond all praise, and when we remember that their author was far advanced in years when he wrote them, the feat seems miraculous. 'Second childhood' is not always so like the 'first,' as that of P. seems to have been. P. died 16th May 1703.

PERRY, an agreeable beverage made by fermenting the juice of pears. It is extensively made in Worcestershire, Gloucestershire, Herefordshire, and Devonshire, and forms, with cider, the chief diet-drink of those districts. It contains from five to nine per cent. of alcohol. The best pears for making perry are those which from their rough taste are least agreeable for eating.

PERSEA. See AVOCADO PEAR.

PERSECUTIONS, THE TEN, of the Christian Church, is the name by which are known in ecclesiastical history certain periods of special severity exercised towards the rising community of Christians, for the purpose of compelling them to renounce their new creed, and to conform to the established religion of the empire. The Christian community were at all times regarded with suspicion and dislike in the Roman empire—the constitution of Rome not only being essentially intolerant of those new religions which, like the Christian, were directly aggressive against the established religion of the state, but being particularly hostile to private associations and private assemblages for worship, such as those which every Christian congregation by its very nature presented; and thus there are very few periods, during the first three centuries, in which it can be said that the church enjoyed everywhere a complete immunity from persecution. But the name is given particularly to certain periods when either new enactments were passed against Christianity, or the existing ones were enforced with unusual rigour. The notion of *ten* such periods is commonly accepted almost as an historical axiom; and it is not generally known that this precise determination of the number is comparatively recent. In the 4th c., no settled theory of the number of persecutions seems to have been adopted. Lactantius reckons up but six; Eusebius does not state what the number was, but his narrative supplies data for nine. Sulpicius Severus, in the 5th c., is the first who expressly states the number at *ten*; but he only enumerates nine in detail, and in completing the number to ten, he adds the general persecution which, at the coming of Antichrist, is to precede the end of the world. The fixing of ten as the number seems to have originated in a mystic allusion to the ten horns of the beast in the Apocalypse (xvii. 12).

It need hardly be said, however, that this is only a question of words, the diversity of enumeration arising from the different notions attached by the several historians to the designation *general*. If taken quite strictly to comprise the entire Roman empire, the number must fall below ten; if used more loosely of local persecutions, the number might be very largely increased. The ten persecutions commonly regarded as general are the following: the persecution under Nero, 64 A.D.; under Domitian, 95 A.D.; under Trajan, 107 A.D.; under Hadrian, 125 A.D.; under Marcus Aurelius, 165 A.D.; under Septimius Severus, 202 A.D.; under Maximinus, 235 A.D.; under Decius, 249 A.D.; under Valerianus, 257 A.D.; under Diocletian, 303 A.D. The extent and the duration of some of these have been the subject of

PERSEPOLIS.

considerable controversy, and indeed an animated discussion was maintained for a long period as to the probable total number of victims in the pagan persecutions of the church. Such controversies are beyond the scope of this publication. It is quite certain that there have been exaggerations on the Christian as well as on the adverse side; but it has been shewn beyond the possibility of doubt, and the most recent explorations have confirmed the arguments, that the data on which the estimates of Dodwell and Gibbon, the most prominent advocates of the theory of the small number, were founded, were uncertain, and even fallacious; and that, not to speak of the many victims of the constantly recurring local violence, the number who fell in each of the above-named persecutions was both large in itself, and spread, in most cases, over a considerable extent of the Roman empire. The most violent, as well as the most widely-spread of these persecutions, were those under Nero, Trajan, Maximinus, Decius, and Diocletian. The last-named, though called by Diocletian's name, was in reality far less the work of that emperor than of his colleague Galerius; but it was extremely cruel, and, with occasional interruptions, continued from the year 303 down to the victory of Constantine over Maxentius—a period of nearly ten years.

PERSEPOLIS (Persian City), the Greek translation of the lost name of the capital of ancient Persia (*Parsa-Karta*), was situated on the river *Araxes* (Bendemir), to the east of the river *Medus* (Polwat, or River of Murghab), in the plain of *Merdusht*, about 35 miles to the north-east of

Shiraz, on the road to Ispahan. A certain number of most remarkable ruins is all that now remains of that city, with which, according to ancient writers, 'no other city could be compared either in beauty or in wealth, and which was generally designated 'The Glory of the East.' Darius Hystaspes, Xerxes, Artaxerxes, and other Achæmenides, each in his turn contributed towards its aggrandisement. Alexander the Great, in his march of conquest, is said to have destroyed P. completely; but this must probably only be understood to apply to some of the chief palaces. It may also be presumed that after the fall of the Achæmenides, that extension of the original town (afterwards known, and important in history up to within a recent period, as *Istakhar*), on which were situated the royal edifices and temples used as the royal treasuries up to the time of Epiphanes, gradually fell into decay. The situation of these structures, overlooking the vast luxuriant plain of *Merdusht*, is described in terms of rapturous enthusiasm by every traveller from Chardin to our own day. Three groups are chiefly distinguishable in the vast ruins existing on the spot. First, the *Chehel Minâr* (Forty Pillars), with the Mountain of the Tombs (*Rachmed*), also called *Takht-i-Jamshîd* or the structure of *Jamshîd*, after some fabulous ancient king, popularly supposed to be the founder of Persepolis. The next in order is *Naksh-i-Rustam*, to the north-west, with its tombs; and the last, the building called the *Haram of Jamshîd*. The most important is the first group, situated on a vast terrace of cyclopean masonry at the foot of a lofty mountain-range. The extent of this terrace

Ruins of Persepolis.

(Copied from Fergusson's *Palaces of Nineveh and Persepolis Restored*.)

is about 1500 feet north-by-south, and about 800 east-by-west, and it was, according to Diodorus Siculus, once surrounded by a triple wall of 16, 32, and 60 cubits respectively in height, for the triple purpose of giving strength, inspiring awe, and defence. The whole internal area is further divided into three terraces—the lowest towards the south; the central being 800 feet square, and rising 45 feet above the plain; and the third, the northern, about 550 feet long, and 35 feet high. No traces of structures are to be found on the lowest platform; on the northern, only the so-called 'Propylæa' of Xerxes; but the central platform seems to have been occupied by the foremost structures, which again, however, do not all appear to have stood on the same level. There are distinguished here the so-called 'Great Hall of Xerxes' called (*Chehel Minâr*, by way of eminence), the Palace of Xerxes, and the Palace of Darius, towering one above the other in successive elevation from the ground. The stone used for the buildings

is dark-gray marble, cut into gigantic square blocks, and in many cases exquisitely polished. The ascent from the plain to the great northern platform is formed by two double flights, the steps of which are nearly 22 feet wide, 3½ inches high, and 15 inches in the tread, so that several travellers have been able to ascend them on horseback. What are called the *Propylæa* of Xerxes on this platform are two masses of stone-work, which probably formed an entrance-gateway for foot-passengers, paved with gigantic slabs of polished marble. Portals, still standing, bear figures of animals 15 feet high, closely resembling the Assyrian bulls of Nineveh. The building itself, conjectured to have been a hall 82 feet square, is, according to the cuneiform inscriptions, as interpreted by Rawlinson, the work of Xerxes, and reads as follows:

'The great god *Auramajda*, he it is who has given this world, and who has given life to mankind, who has made Xerxes king, both king and

lawgiver of the people. I am Xerxes the king, the great king, the king of kings, the king of the many-peopled countries, the supporter also of the great world, the son of King Darius, the Achæmenian.

'Says Xerxes the king, by the grace of Auramazda, I have made this gate of entrance; there is many another nobler work besides this Persepolis which I have executed, and which my father has executed;' &c.

An expanse of 162 feet divides this platform from the central one, which still bears many of those columns of the Hall of Xerxes from which the ruins have taken their name. The staircase leading up to the Chehel Minâr, or Forty Pillars, is, if possible, still more magnificent than the first; and the walls are more superbly decorated with sculptures, representing colossal warriors with spears, gigantic bulls, combats with wild beasts, processions and the like; while broken capitals, shafts, pillars, and countless fragments of buildings, with cuneiform inscriptions, cover the whole vast space of this platform, 350 feet from north to south, and 380 from east to west. The Great Hall of Xerxes, perhaps the largest and most magnificent structure the world has ever seen, is computed to have been a rectangle of about 300—350 feet, and to have consequently covered 105,000 square feet, or 2½ acres. The pillars were arranged in four divisions, consisting of a centre group six deep every way, and an advanced body of twelve in two ranks, the same number flanking the centre. Fifteen columns are all that now remain of the number. Their form is very beautiful. Their height is 60 feet, the circumference of the shaft 16, the length from the capital to the torus, 44 feet. The shaft is finely fluted in 52 divisions; at its lower extremity begin a cincture and a torus, the first, two inches in depth, and the latter, one foot, from whence devolves the pedestal, shaped like the cup and leaves of the pendent lotus, the capitals having been surmounted by the double semi-bull. Behind the Hall of Xerxes was the so-called Hall of Hundred Columns, to the south of which are indications of another structure, which Fergusson terms the Central Edifice. Next along the west front stood the Palace of Darius, and to the south the Palace of Xerxes, measuring about 86 feet square, similarly decorated, and of similar grand proportions. —For a further and more minute description, we refer to the travels of Niebuhr, Ker Porter, Rich, and other travellers; to Fergusson's *Palaces of Nineveh and Persepolis Restored*, and to Vaux's *Nineveh and Persepolis*. See also the articles CYRUS, DARIUS, XERXES, CUNEIFORM, and PERSIAN ARCHITECTURE.

PERSEUS, also PERSIS, the last king of Macedonia, was the eldest son of Philip V., and was born in the latter part of the 3d c. B.C. He was trained to a military life from his earliest years, and after bringing about the death of his younger brother, Demetrius, who was a favourite both with the Macedonians and the Romans, he succeeded his father on the throne 179 B.C. Philip had long foreseen that a contest between Rome and Macedonia was inevitable, and he had carefully prepared for it, so that P., on his accession, found himself forearmed. Meanwhile, he governed Macedonia with great prudence and moderation, and became decidedly popular with his subjects and neighbours. Seleucus IV. (Philopator) gave him his daughter Laodice in marriage; Prusias, the Bithynian king, married his sister; the Greek states looked favourably on his projects, and his envoys were well received even at Carthage. The Romans took the alarm, and—after some delusive negotiations—sent an army into Thessaly (171 B.C.). The war lasted four years; in the first three, the advantages were so little on the side of the Romans, that there was a widespread feeling in P.'s favour in the countries bordering on

the Levant and the Archipelago. In the beginning of the fourth campaign (168 B.C.), L. Æmilius Paulus arrived, and took command of the Roman forces. A great battle was fought at Pydna (June 22), in which the army of P. was utterly routed. The king himself was soon afterwards forced to surrender, and conveyed to Rome, where he adorned the triumph of the conqueror. He died in captivity at Alba, a few years later.

PERSEUS, in Grecian Mythology, the son of Zeus and Danaë (q. v.), and grandson of Acrisius. He was brought up at Seriphos, one of the Cyclades, where Polydectes reigned, who, wishing to get rid of him for private reasons, sent him, when yet a youth, to bring the head of the Gorgon Medusa, on the pretence that he wanted to present it as a bridal gift to Hippodamia. P. set forth under the protection of Athene and Hermes, the former of whom gave him a mirror, by which he could see the monster without looking at her (for that would have changed him into stone); the latter, a sickle; while the nymphs provided him with winged sandals, and a helmet of Hades, or invisible cap. After numerous wonderful adventures, he reached the abode of Medusa, who dwelt near Tartessus, on the coast of the ocean, and succeeded in cutting off her head, which he put into a bag, and carried off. On his return, he visited Ethiopia, where he liberated and married Andromeda, by whom he subsequently had a numerous family, and arrived at Seriphos in time to rescue his mother from the annoyance of the too ardent addresses of Polydectes, whom, along with some of his companions, he changed into stone. After this, he went to Argos, from which Acrisius fled to Thessaly, and P. assumed the vacant throne. But this, like many other details of the myth, is differently narrated. P. was worshipped as a hero in various parts of Greece, and, according to Herodotus, in Egypt too. In ancient works of art, the figure of P. much resembles that of Hermes.

PERSEVERANCE OF SAINTS, a doctrine necessarily resulting from the most essential parts of the Calvinistic system, and therefore held by almost all who adopt the Calvinistic or Augustinian doctrines. It is advocated not only by arguments from other doctrines, as those of election, atonement, the intercession and mediatorial dominion of Christ, imputed righteousness, and regeneration, but also from many texts of Scripture, as those which declare *eternal life* to be always connected with believing, and those which encourage the believer to depend on the faithfulness, love, and omnipotence of God. To an objection very commonly urged against it, that it tends to make men careless concerning virtue and holiness, its advocates reply, that this objection is only valid against a doctrine very different from theirs, the true doctrine of Perseverance of Saints being one of perseverance in holiness, and giving no encouragement to a confidence of final salvation which is not connected with a present and even an increasing holiness.

PERSHORE, a market-town in the county of Worcester, and 9 miles south-east of the city of that name, on the Avon. It contains two churches—that of St Andrew's, small and ancient; and the church of the Holy Cross, in Norman and Early English, with a lofty square tower. This church is the only remaining portion of the ancient abbey-church of the same name. Pop. (1861) 2905, who are employed in wool-stapling, in manufacturing agricultural implements, and in raising fruits and vegetables for the markets of the large manufacturing towns in the vicinity.

PE'RSIA, called by the natives IRAN (see ARYAN RACE), the most extensive and powerful

whole kingdom of Western Asia, is bounded on the E. by the great basin of Russia, the Caspian Sea, and the Persian-Armenian provinces of Russia; on the S. by Baluchistan, Afghanistan, and Beluchistan; on the W. by the Strait of Ormuz and the Persian Gulf; and on the N. by the Shal-el-Araxes and Araxes Provinces. It contains about 440,000 P. but square miles, and occupies for the most part of a great level and elevated plateau, which in the centre and on the east side is almost a dead level; but on the north, west, and south, is covered with a broad belt of mountain-ranges, hills, and those interspersed with tracts of desert and small fertile plains. The mountain-system of P. has its root in the north-west corner of the Caucasus, and is a continuation of the Taurus, Armanian, and Caucasian chains. The Taurus chain enters P. a little to the northwest of Lake Van (q.v.), and then forms a south-westerly direction, sending out numerous parallel chains, which traverse the west and south of the country, moving it for a width of from 100 to 300 miles. At its south-western extremity, this chain joins the Jilal-Mal, which runs eastward through the centre of the province of Kerman, and forms the southern boundary of the plateau. The range is generally low, and like all other mountains of the same country, presents many snows and glaciers. The province of Azerbidjan, in the north-west, is almost wholly mountainous. On the east side of Azerbidjan, a part of the Caucasus, separated from it, however, by the valley of the Eux and Araxes, runs southwards at some little distance from, and parallel to, the chain of the Caucasus, at the south-west corner of which it becomes more elevated, and as the eastern range of the Elburz takes an easterly direction, following the line of the Caspian coast at a distance varying from 12 to 60 miles. On reaching Astrabad, it divides into three great parallel ranges of somewhat inferior elevation, which pursue first a west, and then a south-west direction, joining the Taurus in Afghanistan. Many of the hills in the Elburz are covered with perpetual snow; and the highest peak, Mount Demavend, is more than 20,000 feet above the sea. The Persian mountains are mostly of a primitive character; granite, porphyry, gneiss, and mountain limestone enter largely into their composition; they also, in great part, exhibit evidences of volcanic action—Demavend itself being certainly an extinct volcano; and the destructive earthquakes which are still of frequent occurrence in the north and north-west of P., indicate the presence of subterranean fires. The Elburz on the north, the Zagros on the west, the Kerman Mountains on the south, and Afghanistan on the east are the boundaries of the Persian plateau, which ranges from 2000 to 5000 feet above sea-level, the lowest portion being the Great Salt Desert, in the south-west of Khuzestan, which has 2000 feet of elevation above the sea; while the average elevation of the whole plateau above the sea is about 4000 feet. The lower level, out of which the upland rises, is called the *Dasht-e-Khazir*, or 'Level Country,' and extends along the coast of the Persian Gulf and Gulf of Ormuz, south of the Bakhtiari and Luristan ranges, and also along the Caspian Sea, between it and the Elburz. The aspect of the country diversified as it is for the most part with hills and valleys, mountain and plain, is, contrary to what might naturally be expected, dreary and unattractive. The interior mountains are everywhere low and arid, unadorned by trees or shrubs, and present the appearance of huge masses of gray rock piled one on the other, or starting in abrupt ridges from the level plain. The plains are equally unattractive, and those which are not deserts,

consist either of gravel which has been washed down from the mountain slopes or accumulated into dunes and extensive beds during some former revolution of nature, or of a hard dry clay. To render such a country fertile, requires the presence of abundant water; but unfortunately for P., nature has been considerably sparing in this respect. The whole of the east and centre of the country is entirely destitute of rivers; the country south of the Kerman Mountains is very meagrely supplied, the rivers, such as they are, being almost wholly confined to the western and the Caspian provinces.

Almost the whole of Khuzestan (q. v.), the north half of Kerman (q. v.), the east of Irak Ajem (q. v.) which form the great central plain, and detached portions of all the other provinces, with the exception of those on the Caspian Sea, forming more than three-fourths of the surface of P., are desert. In some parts of this waste, the surface is dry, and produces a scanty herbage of saline plants; in other parts, it is covered with salt marshes, or with a dry, hard, salt crust, sometimes of considerable thickness, which glistens and flashes in the sunlight, forcing the traveller on these inhospitable wastes to wear a cloth to protect his eyes; but by far the greater portion of this region consists of sand, sometimes so light and impalpable as to be shifted hither and thither by the slightest breeze. This great central desert contains a few oases, but none of great extent. The largest of the salt deserts of P. is the 'Dasht-e-Royal,' immensely known as the Great Salt Desert of Khuzestan, which lies on the north-west of that province, and is 400 miles in length, by 250 miles in breadth.

Some parts of P., however, are of remarkable fertility and beauty; the immense valleys, some of them 100 miles in length, between the various ranges of the Persian Mountains, abound with the rarest and most valuable vegetable productions; great portions of the provinces of Fars, Khuzestan, Azerbidjan, and Azerbijan, have been lavishly endowed by nature with the most luxuriant vegetation; while the Caspian provinces, and the southern slopes of the Elburz, are as beautiful as wood, water, and a fine climate can make them—the mountains being clothed with trees and shrubs, and the plains studded with nature's choicest products.

Rivers.—P. has hardly one river that can properly be termed navigable, though some of them are several hundred miles in length, and of great width and volume of water; the few that are of sufficient importance to deserve mention are—the Karun, which rises in the mountains to the south of Isfahan, flows first west, and then south-south-west, receiving many tributaries in its course, and falls into the Shal-el-Arab (q. v.), near Moham-metah; the Kerkiah (or Karas of the Turks), nearly equal to the Karun in size, and rising in the same range, which flows first westward, and then south-south-east, watering the west side of Luristan and Khuzestan, and joins the Tigris a little above its junction with the Euphrates; the Kizil-Urm, or Seld-Rud ('White River'), which springs from the Sahand range, and flows in an easterly direction, falling into the Caspian Sea a little to the east of Rasht. The Aras, or Araxes (q. v.), is by far the largest river in P.; but it can scarcely be considered a Persian river, as it never enters the country, but merely forms, for some distance, the northern boundary towards Russia. The rivers which flow to the southwards receive, in the latter part of their course, few tributaries, and fertilise only a narrow strip of land on each side of them, except when their waters are applied, by means of canals or other works, to the artificial irrigation of the soil. This mode of increasing and extending the

productive powers of the country was much employed in ancient times; but the constant change of masters, and the never-ending disturbances under which P. has so long suffered, led to the neglect of the practice, and most of these specimens of the architectural skill and laborious industry of the ancient Persians, are now in a ruinous condition. The Caspian provinces abound in rivers, but the greater number of them, from the proximity of the Elburz Mountains to the Caspian, are mere mountain torrents, which become dry in summer.

Lakes.—P., as a natural consequence of the nature and situation of its surface, abounds with saline lakes, and there are nearly thirty of them having no visible outlets. The chief lake is Lake Urumiah (q. v.), in Azerbaijan. Lake Bakhtegan, in the east of Fars, the receptacle for the drainage of the northern half of that province, is about 60 English miles in length, by 9 in breadth. Lake Shiraz (q. v.) is much smaller.

Climate and Products.—The climate is necessarily very varied. What the Younger Cyrus is reported to have said to Xenophon regarding the climate, 'that people perish with cold at the one extremity, while they are suffocated with heat at the other,' is literally true. P. may be considered to possess three climates—that of the southern Dusstistan, of the elevated plateau, and of the Caspian provinces. In the Dusstistan, the autumnal heats are excessive, those of summer more tolerable, while in winter and spring the climate is delightful. The cold is never intense, and snow seldom falls on the southern slope of the Kerman range. The rains are not heavy, and occur in winter and spring. The district is extremely unhealthy. On the plateau, the climate of Fars is temperate, and as we proceed northwards, the climate improves, attaining its greatest perfection about Isfahan. Here the winters and summers are equally mild, and the regularity of the seasons appears remarkable to a stranger. To the north and north-west of this, the winters are severe; and in Kurdistan, the greater part of Azerbaijan, and the region of the Elburz, the climate is quite alpine. The desert region of the centre and east, and the country on its border, endure most oppressive heat during summer, and piercing cold in winter. The Caspian provinces, from their general depression below the sea-level, are exposed to a degree of heat in summer almost equal to that of the West Indies, and their winters are mild. Rains, however, are frequent and heavy, and many tracts of low country are marshy and extremely unhealthy. With the exception of the Caspian provinces, the atmosphere of P. is remarkable above that of all other countries for its dryness and purity, a fact frequently proved by exposing pieces of polished iron to the action of the air, and finding whether or not they rust.

The cultivated portions of P., when supplied with moisture, are very fertile, producing an immense variety of crops. The chief cultivated products are wheat (the best in the world), barley, and other cereals, cotton (of which, according to the statement of the Persian ambassador at London in 1861, enough could be grown in the southern provinces to supply the manufactories of Western Europe), sugar, rice, and tobacco. The vine flourishes in several provinces, and the wines of Shiraz are celebrated in Eastern poetry. Mulberries are also largely cultivated, and silk is one of the most important products of the kingdom. The forests on the slopes of the Elburz abound with wild animals, as wolves, tigers, jackals, boars, buffaloes, foxes, and the Caspian cat. Lions and leopards also abound in Mazanderan. Among domestic animals, the horse and camel hold the first place. The horses have always been celebrated as the finest

in the East. They are larger and more handsome, but less fleet than the Arabian horses. Immense herds of sheep and goats feed upon the mountain slopes of the southern provinces, and yield their owners a rich product in wool and goat-hair of the very finest quality. The wool of the goats is spun into various fabrics, which, in softness and beauty, almost vie with those of Cashmere. The Caspian rivers abound with fish, especially sturgeon, great quantities of which are cured and exported to Russia. The mineral products of P. are insignificant, with the sole exception of salt. None of the precious metals are found. Iron is abundant in Azerbaijan, but is little worked; copper occurs in considerable quantity in the mountains of Mazanderan and Kerman; and lead, antimony, sulphur, and naphtha also abound. But the most celebrated mineral product of P. is the turquoise, which is found in the Fironz Koh, one of the Elburz Mountains, and in a hill 40 miles west-north-west of Nishapür. The former mine is not now worked, but the mines in the latter place still yield these gems in abundance; and if they were properly worked, the yield might be greatly increased. The gems, however, are generally defaced by flaws, and do not possess a high mercantile value. Marble of different kinds, coal, freestone, and slate, are found in various places. At Dalki, in Fars, are two fountains of bitumen or black naphtha.

Inhabitants.—The population of P. is naturally divisible into two classes, the settled and the nomad. The settled population are chiefly Tajiks, the descendants of the ancient Persian race, with an intermixture of foreign blood—Turkish, Tartar, Arab, Armenian, or Georgian. To this class belong the agriculturists, merchants, artisans, &c. From having long been a subject race, they have to a large extent lost their natural independence and manliness of character, and acquired, instead, habits of dishonesty, servility, and cunning. The Tajiks are Mohammedans of the Shiite sect, with the exception of the few remaining Parsees or Guebres (q. v.), who are found in Kerman and Fars, and still retain their purity of race and religious faith. The nomad or pastoral tribes, or *eylats* (q. v. clan), are of four distinct races—Turkomans, Kurds, Lûurs, and Arabs. Their organisation is very similar to that which formerly subsisted among the Highland clans of Scotland, with the exception that the former are nomad, while the latter inhabited a fixed locality. Each tribe is ruled by its hereditary chief (*ujak*), and under him by the heads of the cadet branches (*dir*) of his family. Of the four races, the Turkomans are by far the most numerous, and forms at the present day the ruling race in Persia. The Kurds are few in number, the greater part of their country and race being under the sway of Turkey. The Arabs are also few in number, and at the present day can hardly be distinguished from the Persians, having adopted both their manners and language. The Lûurs are of nearly pure Persian blood. The nomad races, especially the Turkomans, profess the Shiite creed; they are distinguished from the Tajiks by their courage, manliness, and independence of character; but they are inveterate robbers, and since their entrance into the country in the 10th c., it has been continually distracted by civil wars and revolutions. The whole population of P. is estimated at round numbers at 10,000,000, of whom 3,000,000 are nomads (200,000 of these being Arabs). Classified according to their religious belief, they stand thus: 7,500,000 are Shiites; 500,000 are Shiites not orthodox; 1,500,000 are Sunnites; while the remaining 500,000 is made up of Christians of all denominations (including 200,000 Armenians, 100,000 Nestorians), along with Jews, Guebres, &c.

Notwithstanding its ancient civilisation, almost the same barbarism now prevails in P. as in other Mohammedan countries, and few traces remain of the intellectual culture which in ancient times distinguished the country. The insecurity of property has prevented the improvement of land, the extension of trade, and public works of every kind. The roads are utterly neglected. The houses, those of the wealthiest people not excepted, appear everywhere being generally built of earth or mud, and are grouped together, even in the principal towns, with little attention to either uniformity or taste in their arrangement. They scarcely ever exceed one story in height, and they are surrounded by high black walls. The public buildings, such as mosques, colleges, and caravanserais, are of similar structure to the ordinary houses, and built of the same materials. The interior, however, of the domes of the cities are sometimes perfect palaces of beauty and elegance; and moreover such dwellings surrounded of mud may offend a European eye, it is unquestionable in conjunction with all the disadvantages, and is at least a better building material than wood, as due to a country possessing such a climate as Persia. The possible look of the towns is, however, greatly improved by the beauty of the gardens which surround them. These gardens are planted with forest and fruit trees, and some of them, especially in Irak and Khorasan, are of rare beauty.

Manufactures and Trade.—The trade of P. is comparatively of little importance. Silk is the chief article, and is produced in every province, but chiefly in those of the north; cotton and woolen fabrics, shawls, carpets, and felt are largely manufactured for use and export in Khorasan. The shawls, which consist of satin, muslin, broadcloth, &c., and are made exceedingly strong and durable, are of inferior quality, and are chiefly exported to Turkey and Russia. Trade is carried on by caravans with the interior of Asia and the chief towns of P., such as Teheran, Abulshahr, Isfahan, Shiraz, Teheran, and Rasht. These caravans exchange the products of P. for woolen, leather, glass, cotton, china, glass, hardware, gums, dyestuffs, and spices. The trade of the Caspian Sea is monopolised by the Russians, who visit periodically the four ports of Enzeli, Baku, Rasht, and Astrabad. India, Russia, and Transcaspia are the ports in the Persian Gulf through which trade with India and the other countries on the shores of the Indian Ocean is carried on. The exports to India consist chiefly of horses, dried fruit, and drugs; and the imports from that country and Europe, of broadcloths, cotton goods, jewellery, arms, cutlery, watches, various glass and metal wares, &c. The value of imports and exports for the last few years, by the western frontier, imports, £1,876,812; exports, £1,212,042. By the eastern frontier, imports, £1,159,429; exports, £1,101,450. Total, imports, £3,036,241; exports, £2,313,492.

Government, Taxation, Education, &c.—The government of P. is a pure despotism, limited only by domestic intrigues, dread of private revenge, and an occasional insurrection. The latter is the principal check against unjust government on the part of the monarch, while the former operates as powerful restraints on his conduct. The monarch, who has the title of 'Shah' and 'Lillah', possesses absolute authority over the lives and property of his subjects; and his system has government of provinces and districts, some under his authority over those under them; but which are, however, liable to revision by the Shah, who may summarily inflict any punishment upon him for real or alleged misgovernment. Oppression of the working and mercantile classes is

almost a necessity of such a form of government. The capitalists of the country, a numerous class, have not acquired their wealth, much less invested it in any mercantile transactions, but they should thereby excite the jealousy of some rapacious governor. The central government consists of the *Sadret-Azam*, or Grand Vizier, who is superior in authority to the Shah alone; the *Resident-Darbar*, or Minister for Foreign Affairs; the *Prophet-Darbar*, or Minister of Finance; the *Seyyid-Darbar*, or Minister of the Interior; the *Lashkar-Azam*, or War Minister, and various superintendents of the administration of justice, of commerce, agriculture, industry, and public works, the commander-in-chief, and the master of the ceremonies. The law, which in civil cases is administered by Mollahs (q.v.), in criminal cases by a state court, is founded on the *Shari'ah* and on tradition. The punishments commonly inflicted are flogging (the *bastinado*), and death, either by decapitation, staking, or tortures. The governors of provinces, who are always chosen from the governing class, the Turkomans, and are generally of the blood royal, though they oppress to the utmost the poor *Levies*, are seldom able to protect their provinces from the ravages of the predatory extortions, who, though nominally subject to the Shah, are governed by their own khans, and are really independent. The revenue is derived from a tax on the gross produce of land, which varies from 10 to 20 per cent, on the whole, from the seven lands (which are being constantly increased by acquisitions) from the church-lords (which since the time of Nadir Shah (q.v.) have been in the hands of the Shah, from a tax on cattle, ducks, and even bees, and many other imposts. There is also a heavy property and income tax, and the various duties which are levied on imports and exports are almost prohibitive. Besides all these, taxation and duties are levied specially on Armenians, Jews, and Guebres. The revenue derived from these exactions is greatly increased by presents, which all those who are in any way dependent on court-favour are bound to make to the Shah on certain days, and which amount annually to nearly £1,000,000. The revenue is divided into two portions, one of which goes into the 'spiritual Treasury,' or *Dar-ul-Mak*, and is expended on mosques, payment of judges and clergy, assistance of poor Moslems, public works and institutions, such as roads, bridges, schools, &c., subsidies to pilgrims to holy places, and to the Prophet's descendants, &c.; the other, which is by far the larger, goes into the crown treasury, which is charged with the maintenance of the Shah, his family, servants, and court, and the defraying of all public expenses, salaries, &c., unconnected with religion. The receipts for the year 1875 were, to the spiritual treasury, 2,500,000 tomanes = £1,250,000; to the crown treasury (not including the gifts to the Shah), 7,000,000 tomanes = £3,500,000. There is no public debt, and all extra expenses are at once met by extra taxation. The proportion of the revenue which is applied to the support of schools for public instruction, is small, and education is thus necessarily in a very low state. The sciences of astronomy, metaphysics, physics, and mathematics, are nominally studied, but the astronomy consists of the Ptolemaic system, largely intermixed with astrology, and the other sciences as taught are similarly composed of the debris of false systems and ancient superstitions.

Political Divisions, &c.—From the earliest times down to the present century, P. was divided into seven or eight great divisions; but about the time when it was attempted to introduce European

civilisation into the country, and discipline into the army, the country was anew divided into 25 provinces—viz., the three Caspian provinces of Gilan, Mazanderan, and Astrabad, in the north; Azeriijan, Ardalan or Persian Kurdistan, Luristan, and Khuzistan, in the west; Fars, Laristan, and Kerman with Mogistan, in the south; while the great province of Irak-Ajemi in the centre was divided into Khamsah, Kasbin, Teheran, Hamadan, Kûm, and Ispahan; and that of Khorassan in the east into Yezd, Tabas, Ghayn and Birjun, Turshiz, Meshid, Damghan, Semnûn, and the Dasht Beyad, or the Great Salt Desert. The western and northern provinces are well sprinkled with towns and large villages, but the most of the others consist of little more than the chief town and its suburbs, the rest being either desert, or in the hands of the wild pastoral tribes. There are many interesting ruins of ancient, populous, and celebrated cities in Persia, for example, Persepolis (q. v.), Rhages or Rhé, Shahpur; Istakhar, Tûs, Merv, Shushan, Hamadan, &c.; and the monuments and inscriptions found at some of these places form a highly-interesting study to the historian and the antiquary. See BEHISTUN. In modern times, Tabriz or Tauris, Kazbin, Ispahan, and Shiraz, have been in succession the seats of royalty, and at present Teheran is the favoured city.

Army.—The army consists (1860) of 80,000 regular infantry, 4000 regular cavalry, 2000 engineers and artillerymen, and a large body of irregular cavalry, which generally numbers about 30,000 men, and is contributed by the nomad tribes, being almost their sole acknowledgment of subjection to the Shah. This irregular cavalry, which forms the bravest portion of the Persian army, is equal to the Cossacks in the Russian army, and much superior to the Turkish Sultan's Bashibazouks. Abbas Pasha, the grandfather of the present Shah, attempted to organise a portion of the army according to European tactics, but he was unsuccessful.

History.—According to the *Shah Nameh* of Firrûsi (q. v.), the history of P. begins some thousands of years before the Christian era. Little has yet been done towards extracting the grains of historical truth that may be contained in the mass of fable that constitutes the native Persian annals; although hopes are cherished that by aid of the many inscriptions and monuments that are being daily discovered, light may yet be thrown upon many points. In the meantime, we must rest contented with the accounts derived from Greek writers. The north-western part of Iran, anciently called Media (q. v.), was, at the earliest period known to the Greeks, a part of the Assyrian empire, but the Medes revolted, and (708 B.C.), under Dejoces, established an empire which subdued both that of Assyria and their own kindred tribes of Persia. See MEDIA. About 537 B.C., the Persians under CYRUS (q. v.)—the Kai-Khusru of the Persians—(559—529 B.C.) rebelled, subdued their former masters, the Medes (who from this time became amalgamated with them), and established a mighty empire, which included, besides P., as far as the Oxus and Indus, Asia Minor, Syria, Palestine, and Mesopotamia. His son, CAMBYSES, a most ferocious and blood-thirsty tyrant (529—522 B.C.), subdued Tyre, Cyprus, and Egypt. After the brief rule of the usurper SMERDIS (522—521 B.C.), DARIUS I. (q. v.), surnamed HYSTASPES—the Gushtasp of the Persians—(521—485 B.C.), mounted the throne. He was a politic and energetic prince, and succeeded in firmly establishing his dynasty, and adding Thrace and Macedonia to his empire; but his two attempts to subdue Greece were completely foiled, the first by the Thracians, and the second by the Athenians at

Marathon (490 B.C.). His son, XERXES I. (485—465 B.C.)—the Isfundeâr of the Persians—renewed the attempt to subdue the Greek states, and though at first successful, the defeats of Salamis and Plataea compelled him to limit himself to a defensive warfare, which exhausted the resources of his kingdom. His son, ARTAXERXES I. (465—425 B.C.), surnamed LONGIMANUS (the Bahman of the Persians, better known as Ardeshir Dirazdust), was a valiant prince, but he was unable to stay the decadence of P., which had now commenced. He, however, crushed a formidable rebellion in Egypt, though his wars with the Greeks and Ionians were unsuccessful. The empire now became a prey to intestine dissensions, which continued during the reigns of his successors, Xerxes II., Sogdianus, Darius II., Artaxerxes II., and Artaxerxes III. DARIUS III. CODOMANNUS (336—329) (the Darab II. of the Persians), the last of the dynasty, was compelled to yield his throne to Alexander (q. v.) the Great, king of Macedon (known as Secunder by the Persians), who reconquered all the former provinces of P., and founded a vast empire, which, at his death in 324 B.C., was divided into four parts, P. along with Syria falling to the share of the Seleucidae (q. v.), and its old dependency, Egypt, to the Ptolemies (q. v.). The Seleucidae soon lost Bactria (now Balkh), which became independent under a series of Greek sovereigns; and about 246 B.C. Parthia (q. v.)—now Northern Khorassan—also rebelled under ARSACES I. (the Ashk of the Persian writers), who founded the dynasty of the Arsacidae, under whom the greater part of P. was wrested from the Greeks, and maintained against both the Greeks and Romans. The Greek empire of Bactria, which is said to have included a great part of Hindustan, was overthrown by an influx of nomad tribes from Turkestan, and these invaders having been driven out by the Parthians, Bactria was added to their empire. But the dynasty of the Arsacidae was brought to an end by a Persian named Ardeshir Babegan, who managed to gain possession of Fars, Kerman, and nearly the whole of Irak, before Arduan, the Parthian king, took the field against him. At last, a great battle was fought (218 A.D.) on the plain of Hormuz, in which the Persians were completely victorious. Babegan was now hailed as Ardeshir, king of P., and 'Shahan Shah,' or king of kings. The history of this dynasty will be found under the head of SASSANIDÆ. The Sassanian kings raised P. to a height of power and prosperity such as it never before attained, and more than once perilled the existence of the Eastern Empire. The last king was driven from the throne by the Arabs (636 A.D.), who now began to extend their dominion in all directions; and from this period may be dated the gradual change of character in the native Persian race, for they have been from this time constantly subject to the domination of alien races. During the reigns of Omar (the first of the Arab rulers of P.), Othman, Ali, and the Ommiades (634—750), P. was regarded as an outlying province of the empire, and was ruled by deputy governors; but after the accession of the Abbaside dynasty (750 A.D.), Bagdad became the capital, and Khorassan the favourite province of the early and more energetic rulers of this race, and P. consequently came to be considered as the centre and nucleus of the califate. But the rule of the califs soon became merely nominal, and ambitious governors, or other aspiring individuals, established independent principalities in various parts of the country. Many of these dynasties were transitory, others lasted for centuries, and created extensive and powerful empires. The chief were the THERIDAN

1828-8739, a Turkish dynasty in Khurasan; the Saffarids (Persia, 869-908), in Southern Persia, Irak, and Mesopotamia; the Hamids in Transoxiana, Khurasan, and Sistan; the Dhimis (Persia, 908-1038), in Western Persia; and the Ghaznavids (950), in Eastern Persia. These dynasties supplanted each other, and were finally rooted out by the Seljuks (q. v.), whose dominion extended from the Helmand to Afghanistan. A branch of this dynasty, which ruled in Khurasan (see Khiva, q. v.) gradually occupied the greater part of Persia, driving out the Ghomruids and their successors, the Gattarids (q. v.); but they, along with the numerous petty dynasties which had established themselves in the north-western provinces, were all swept away by the Mongols (q. v.) under GÖKHU-KHÂN (q. v.) and his grandson, Hüskü-Khân, the latter of whom founded a new dynasty, the Khwa-Mohamm (1252-1295). This race becoming extinct, was supplanted by the ILKHAÑIYAH in 1255, but an invasion of the Tartars of Turkistan under TÖMÖR (q. v.) soon freed P. from the petty dynasties which infested it. After the death of Tömör's son and successor, MASH KÖKH, the Turkomans took possession of the western part of the country, which, however, they rather preyed upon than governed; while the eastern portion was divided and subdivided among Tömör's descendants, till, at the close of the 14th c., they were swept away by the LAKHS (q. v.), who found the whole of Eastern P. in their newly divided domains of KAIRA. A new dynasty now arose (1494) in Western P., the line prince of which (Isma'il, the descendant of a long line of dervises and saints, the objects of the highest reverence throughout Western P.), having become the leader of a number of Turkish tribes who were attracted by strong ties of gratitude to his family, overthrew the power of the Turkomans, and seized Aserbaidjan, which was the seat of their power. Isma'il rapidly subdued the northern provinces, and in 1511 took Khurasan and Balkh from the Baktars, but in 1514, he had to encounter a much more formidable enemy—to wit, the mighty Selim (q. v.), the Sultan of Turkey, whose real power was further collected by constant victory against the Scythians, or "Sakas," as the followers of Isma'il were termed. The Persians were totally defeated in a battle on the frontiers; but Isma'il escaped no benefit from his victory, and after his retreat, Isma'il attacked and subdued Georgia. The Persians dwelt with rapture on the character of the invaders, whom they deem not only to be the restorers of P. to a prosperous condition, and the founder of a great dynasty, but the establishers of the faith in which they glory as the national religion. His son TEMASP (1524-1576), a prudent and spirited ruler, repeatedly drove out the predatory Laks from Khurasan, sustained without loss a war with the Turks, and subdued Herat, the son of Isma'il, to regain the throne of Delhi. After a considerable period of internal revolution, during which the Turks and Laks attacked the empire without hindrance, SHAH ABAS I. the Great (1588-1628), ascended the throne, restored internal tranquillity, and expelled the remnants of the Laks and Turks. In truth he inflicted on the Turks such a terrible defeat as kept them quiet during the rest of his reign, and enabled him to recover the whole of Kandahar, Merv, and Herat, which had for a long time been separated from P.; and in the east, Cashghar was taken from the Great Mogul. Abas's government was strict, but just and equitable; roads, bridges, caravansaries, and other conveniences for trade, were constructed at immense expense, and the improvement and embellishment of the towns

were not neglected. Isma'il more than doubled its population during his reign. His reign was remarkable, considering both the equanimity of his measures and subjects; for he encountered the Armenian Christians in exile in the country, well knowing that their personal and intestine hostilities would help to advance the prospects of his kingdom. His successors, SHAH SEIF (1629-1641), SHAH ABAS II. (1641-1666), and SHAH SOLIMAN (1666-1694), were undistinguished by any remarkable talents, but the former two were amiable and judicious rulers, and advanced the prosperity of their subjects. During the reign of Isma'il Hussein (1694-1722), a weak and bigoted fool, priests and dervises were elevated to the most important and responsible offices of the empire, and all who rejected the tenets of the Shiites were persecuted. The consequence was a general discontent, of which the Afghans (q. v.) took advantage by declaring their independence, and seizing Kandahar (1709). Their able leader, MİRZÄ YÄR, died in 1735; but his successors were worthy of him, and one of them, MAHMUD, invaded P. (1722), defeated Hussein's armies, and restored the king in Isma'il. All the inhabitants were refused in the extremity of distress. Hussein then abdicated the throne in favour of his conqueror, who, on his accession, immediately devoted his energies to alleviate the distresses and gain the confidence of his new subjects in both of which objects he thoroughly succeeded. Growing insane, he was deposed in 1735 by his brother ASHER (1735-1739), but the atrocious tyranny of the latter was quickly put an end to by the celebrated NADIR KÖKH (q. v.), who first raised TEMASP (1729-1732) and his son, ABAS II. (1732-1736), of the Safavian race, to the throne, and then, on some frivolous pretext, deposed him, and seized the empire (1736-1747). But on his death, another again returned; the country was horribly despoiled by the rival elements on the throne; Afghanistan (q. v.) and Belochistan (q. v.) finally separated from P., and the country was split up into a number of small independent states till 1755, when a hard, cruel Korim Khan (1755-1779), shouldered this state of affairs, re-established peace and unity in Western Persia, and by his wisdom, justice, and warlike labours, acquired the esteem of his subjects, and the respect of neighbouring states. After the usual contests for the succession, accompanied with the usual barbarities and devastations, Korim was succeeded in 1784 by AH-MERÄD, Isma'il, and LAÏT-ÄL, during whose reigns Mazandheran became independent under AGA-MOHAMMAD, a Turkoman chief of the Kajar race, who repeatedly defeated the royal armies, and ended by depriving LAÏT-ÄL of his throne (1793). The great emerald-king (as he is frequently called), who founded the present dynasty, on his accession announced his intention of restoring the kingdom as it had been established by KÖKH KHAN, and accordingly invaded Khurasan and Georgia, subduing the former country almost without effort. The Georgians besought the aid of Russia; but the Persian monarch, with terrible promptitude, poured his army like a torrent into the country, and devastated it with fire and sword; his conquest was, however, hardly completed, when he was assassinated, May 18, 1797. His nephew, FÄTHER-ÄL (1797-1834), after numerous conflicts, fully established his authority, and completely subdued the rebellious tribes in Khurasan, but the great commotions in Western Europe produced for him bitter fruits. He was dragged into a war with Russia soon after his accession, and by a treaty, concluded in 1797, surrendered to that power Derbent and several districts on the Rur. In 1802, Georgia was de-livered

to be a Russian province. War with Russia was recommenced by P., at the instigation of France; and, after two years of conflicts disastrous to the Persians, the treaty of Gulistan (October 12, 1813) gave to Russia all the Persian possessions to the north of Armenia, and the right of navigation in the Caspian Sea. In 1826, a third war, equally unfortunate for P., was commenced with the same power, and cost P. the remainder of its possessions in Armenia, with Erivan, and a sum of 18,000,000 rubles for the expenses of the war. The severity exercised in procuring this sum by taxation, so exasperated the people, that they rose in insurrection (October 12, 1829), and murdered the Russian ambassador, his wife, and almost all who belonged to, or were connected with the Russian legation. The most humiliating concessions to Russia, and the punishment by mutilation of 1500 of the rioters, alone averted war. The death of the crown-prince, Abbas-Mirza (q. v.), in 1833, seemed to give the final blow to the declining fortunes of P., for he was the only man who seriously attempted to raise his country from the state of abasement into which it had fallen. By the assistance of Russia and Britain, Mohammed Shah (1834—1848), the son of Abbas-Mirza, obtained the crown, but the rebellions of his uncles, and the rivalry of Russia and Britain (the former being generally successful) at the Persian court, hastened the demoralisation of the country. Mohammed was compelled to grant (1846) to Russia the privilege of building ships of war at Resht and Astrabad, and to agree to surrender all Russian deserters, and P. became thus more and more dependent on its powerful neighbour. Nazir-uddin succeeded to the throne on his father's death in 1848; and the new government announced energetic reforms, reduction of imposts, &c., but limited itself to these fine promises, and on the contrary, augmented the taxes, suffered the roads, bridges, and other public works to go to ruin, squandered the public money, and summarily disposed of all who protested against their acts. In October 1856, the Persians took Herat (q. v.), a town for the permanent possession of which they had striven for a long series of years; and having thus violated the terms of a treaty with Britain, war was declared against them, and a British army was landed on the coast of the Gulf, which, under Generals Outram and Havelock, repeatedly defeated the Persians, and compelled them to restore Herat (July 1857). Since this time, treaties of commerce have been concluded with the leading European powers; and Russia, Great Britain, Turkey, France, and Italy, have consuls in the chief towns, and, with the exception of Italy, are represented by ministers at the court of Teheran.

PERSIAN ARCHITECTURE. The architecture of Persia is of considerable interest, both on its own account, and as supplementary to and explanatory of that of Assyria, which, together with the similar edifices in Egypt, is the earliest architecture of which we have any knowledge. The buildings of Persia and Assyria closely resemble one another, and, owing to the mode and the materials in which they were constructed, their remains serve to illustrate and complete each other's history. In Assyria, where no solid building-materials exist, the walls are composed of masses of sun-dried brickwork, lined on the inside, to a certain height from the floor, with large sculptured slabs of alabaster. These have been preserved to us by the falling in of the heavy earthen roofs, with

which, as the later Persian buildings explain to us, the Assyrian palaces were covered. The explorations of Layard and Botta, and the specimens brought home by the former, and now in the British Museum, have made these sculptures familiar to us. The subjects usually are large bulls with human or lions' heads; priests with human bodies, and eagles' or lions' heads, performing religious service before the 'sacred tree.' The Assyrian remains are all of palace-temples, buildings somewhat resembling the Egyptian temples (which were also palaces); and many of the sculptures represent the exploits of the king in war and in peace. The palaces are always raised on lofty artificial mounds, and approached by magnificent flights of steps.

The buildings of Assyria extend over a very long period, the oldest at Nimroud being from 1300 to 800 B.C., and the more recent at Khorsabad and Koyunjik from 800 to 600 B.C. To these succeeded Babylon in the reign of Nebuchadnezzar, and the Birs Nimroud; but these are mere masses of decomposed brickwork, without any sculptures of harder material.

After Babylon came Pasargadæ—where the splendid palaces of Cyrus and Cambyses still exist in ruins—and Persepolis, the capital of Darius and Xerxes (560—523 B.C.), and some remains are still to be found at Susa, Ecbatana, and Teheran. At Persepolis, we find the very parts preserved which at Nimroud and Khorsabad are wanting; for here there is abundance of stone, and the pillars, walls, doorways, &c. (which, in the early examples, were no doubt of wood, and have decayed), being of stone, are still preserved. This has enabled Mr Fergusson to 'restore' these buildings, and to produce most interesting designs, shewing not only how the palaces of Persia were constructed and lighted, but from them to suggest how the arrangements of all the ancient architecture of Egypt and Syria must have been designed.

The halls at Persepolis were square in plan, having an equal number of pillars in each direction for the support of the roof, which was flat. In the centre, a portion was left open for the admission of light, and sheltered by another roof raised upon pillars. The accompanying section (fig. 1) of the Great Hall of Xerxes (from Fergusson's *Handbook of*

Fig. 1.—Section of Hall of Xerxes at Persepolis.

Architecture) will explain this arrangement. This hall is the most splendid building whose remains exist in this part of the world. The remains of the 72 columns with which it was adorned are still extant (fig. 2). The hall had 36 columns, six on each side, and on three sides had an external portico, each with two rows of six columns. These columns had capitals, composed of bulls' heads and shoulders (fig. 3), between which the beams of the roof rested; while others were ornamented with scrolls like the Ionic order (fig. 4). The bases also are suggestive of the origin of that Greek style. This hall was 350

led by 200, and covered more ground than any other building of antiquity, or any medieval ecclesiastical except that of Milan. The palace of

Fig. 2.—Plan of Great Hall of Xerxes at Persepolis.

Persepolis stood on lofty platforms, built with walls of *compensated masonry*, and approached by magnificent flights of stairs, adorned, like the palaces, with

Fig. 3.
Details of Persian Architecture.

sculptures somewhat similar to those of Assyria. The interiors were ornamented with paintings. The use of the arch was known in Assyria, as has been shown by the subterranean archal conduits discovered by Layard, and the gates of Khorsabad discovered by M. Place. The arches of the latter were over the backs of sculptured bulls, and are externally ornamented with enameled bricks.

PERSIAN GULF, an arm of the Indian Ocean which communicates between Arabia and Persia to the west is 600 English miles in a general north-westerly direction. Its breadth varies from 55 miles at the mouth to 250 miles, and the area is estimated at 151,000 square miles, from which about 1900 square miles could be subtracted for the islands, which are scattered over the western half, or lie along the eastern side. The chief

of these islands are *Ormuz* (q. v.) at the mouth, *Rishm*, 500 square miles in extent; and the *Islands* (q. v.), chief of which is *Sonak*. The Great Tenzel Bank stretches along the western side from near Hason to nearly half-way up the gulf. The coast is mostly formed of calcareous rocks. On the Arabian side, it is low and sandy, occasionally broken by mountains and cliffs; while, on the Persian side, it is higher and steeper, with deep water close inshore, owing to the mountainousness of Fars and Kurdistan running close to the water's edge. The islands are partly of limestone and partly of granite, and are generally destitute of springs, barren, desolate, and presenting numerous traces of volcanic eruptions. With the exception of the *Shar-el-Arak* (q. v.), the P. G. contains only insignificant streams. Its eastern side presents abundance of good anchorage, either in the numerous bays or in the lee of islands. The greater portion of its shores now belongs to the *Imam of Muscat*. The coasts of the gulf have been explored by successive British expeditions, the last of which, in 1821–1823, made a complete trigonometric survey of the Arabian shore. The scales of the periodicals in the gulf is generally the reverse of that of the Red Sea (q. v.) currents, as they ascend from May to October, and descend from October to May.

Oriental geographers give to this gulf the name of the 'Green Sea' from a remarkable strip of water, of a green colour, which lies along the Arabian coast. It is strange that from the time of Nearchus, the admiral of Alexander the Great, who was the first to make the P. G. known to Europeans, the Persians have never ruled supreme over its surface.

PERSIAN LANGUAGE AND LITERATURE. The ancient and modern idioms of Persia, which are in general designated as *Persian* or *West Aryan*, belong to the great class of the Indo-European languages; but the term *Persian* itself applies more particularly to the language as it is now spoken, with a few exceptions, throughout Persia; and in a few other places, formerly under Persian dominion, like *Bakthra*, &c. The more important and better-known of the ancient idioms are (1) the *Zend* (the East Iranian or Bactrian language, in two dialects—the 'Gatha idiom,' and the 'ancient' or 'classical' *Zend*), which died out in the 3d c. a. n.—one of the most highly-developed idioms, rich in metaphors, in the verbs as well as in the nouns, and in the former almost completely agreeing with *Vedic Sanskrit*; yet such as we find it in the small remains which have survived, it is no longer in the full vigour of life, but almost decaying, and grammatically somewhat neglected; it is in fact held by a great authority on the subject (Haug), that the grammar was never fixed in any way by rules. To increase the difficulty still more, the texts—the *Zoroastrian books*—never seem to have been copied with proper care, or by men who had any accurate knowledge of the language; so that the critical restoration of the literary remains is matter of extreme difficulty, and *Zend* studies in general may be said to be in their infancy yet. Geographically, this idiom may be placed in Northern Persia. Its alphabet is of Semitic origin, and the writing goes from right to left (see *Zend, Dialects*). (2) *Ancient Persian*, the chief remnants of which are found in the cuneiform inscriptions of the time of the *Achæmenides*, discovered in the ruins of *Persepolis*, on the rock of *Behistun*, and some other places of Persia (see *Cuneiform*). Some relics, chiefly consisting of proper names for gods and men, and terms for vessels and garments, have survived in the writings of the classical period, and in the Bible, chiefly in *Danæ*. This idiom is nearly

nearer to Zend and Sanscrit than to modern Persian. It has still the structure of an ancient organic Indo-Germanic language, with the distinct peculiarities of an Iranian tongue. (3) *Pehlevi* (q. v.) (West Iranian, Median, and Persian), in use during the period of the Sassanides (3d to 7th c. A. D.), an idiom largely mixed with Semitic words, and poorer in inflections and terminations than Zend. Its remnants consist of a certain number of books relating to the Zoroastrian religion, of coins and inscriptions; and the language is not quite the same in all cases—according to the larger or smaller infusion of foreign words. The non-Iranian element is known as *Huzvareh*, and is simply Chaldee; while the Iranian element is but little different from modern Persian. There are three distinct idioms to be distinguished in *Pehlevi*, and the writing varies accordingly, yet it is not certain whether the difference arises from their belonging to different districts or periods. When, however, *Pehlevi* ceased to be a living language, and the restoration of the pure Iranian had begun, people, not daring to change the writings, chiefly of a sacred nature, as they had descended to them from the Sassanian times, began to substitute, in reading, the Persian equivalents to the *Huzvareh* words. At last a new form of commentaries to the sacred writings sprang up, in which more distinct and clear Zend characters were used, where each sign has but one phonetical value, and where all the foreign *Huzvareh* words were replaced by pure Persian ones; and this new form was called (4) *Pâzend*. The transition from the ancient to the modern Persian is formed by the *Parsee*, or, as the Arabs call it, *Farsi*, in use from 700 to 1100 A. D., once the language purely of the south-western provinces, and distinguished chiefly by a peculiarity of style, rigid exclusion of Semitic words, and certain now obsolete forms and words retained in liturgic formulas. It is the Persian once written by the *Parsees* or fire-worshippers, and is in other respects very similar to the present or *modern Persian*, the language of *Jâmi*, *Nizâmi*, and *Hâfiz*—from 1100 to the present time—with its numerous dialects. The purest dialect is said to be that spoken in Shiraz and Isfahan and their neighbourhood. In general, the language is pronounced by universal consent to be the richest and most elegant of those spoken in modern Asia. It is the most sonorous and muscular, while at the same time it is the most elegant and most flexible of idioms; and it is not to be wondered at, that, throughout the Moslem and Hindu realm, it should have become the court language, and that of the educated world in general; holding a position somewhat similar to that which the French language held up to within a recent period in Europe. Its chief characteristic, however, is the enormous intermixture of Arabic words, which, indeed, almost make up half its vocabulary. Respecting its analytical and grammatical structure, it exhibits traces only of that of the ancient dialects of Zend and Achaemenian, of which it is a direct descendant. The elaborate system of forms and inflections characteristic of those dialects has been utterly abandoned for combinations of auxiliary words, which form independent connective links, and which impart fullness and an incredible ease to speech and composition, but which, at the same time, correspond as little to the classical notion of inflection. The grammar of the Persian language has been called 'regular,' but the fact is, that there is hardly any grammar worth mentioning—at all events, no grammar the rules of which could not be mastered in the briefest possible period. To begin with: there is no gender

distinguished in declension; the plural is always formed in the same manner, the only distinction consists in animate beings receiving the affix *ân*, while the inanimate are terminated in *kâ*; further, that instead of the inflection in the different cases found in the ancient languages, either a *mar* (hitherto unexplained) is prefixed, or a *rd* (*rdh* = way, by reason of, *Pehlevi*, *Parsi*) is affixed. Between the genitive and the word which governs it, also between a noun and its following adjective, an *i* is inserted. This is the whole declension, not only of the noun, but also of the adjective and pronoun. The comparative is formed, as in the mother-tongues, by the addition of *ter*; the superlative adds *terin*, which is New-Persian exclusively. Not even the pronouns have a gender of their own; the distinction between masculine and feminine must be expressed by a special word, denoting male or female. There is no article, either definite or indefinite. Singularity of a noun is expressed by an appended *ê*, a remnant of *âeva*, one. The flexion of the verb is equally simple. There is a set of personal terminations for all tenses:—*am*, *i*, *ad* or *ast*; *em*, *ed*, *nd*; the infinitive ends in *tan* or *dan*, the past participle in *tah* or *dih*. The aorist is formed by adding to the root the terminations *am*, *i*, *ad*; *em*, *ed*, and; the preterite by dropping the *n* of the infinitive, and substituting the usual termination. The prefix *mi* or *hami* (*Parsi* and *Huzvareh* = always) transforms the preterite into the imperfect; while the prefix *bi* or *bâh* (the present of the verb 'to will') alters the aorist into the simple future. The other tenses are compounds of the past participle and auxiliary verbs, as in the Teutonic and other modern tongues. The passive is formed by the various tenses of the verb *shudan*, 'to be, to go, to beware,' being placed after the past participle. As to syntax, there is none, or, at all events, none which would not come almost instinctively to any student acquainted with the general laws of speech and composition. As the time of its greatest brilliancy may be designated that in which Firdusi wrote, when Arabic words had not swamped it to the vast degree in which it is now found, and were still, as far as they had crept in, amenable to whatever rules the Persian grammar imposed upon the words of its own language.

In the history of the Persian writing, three epochs are to be distinguished. First, we have the Cuneiform (q. v.), by the side of which there seems, however, to have been in use a kind of Semitic alphabet for common purposes. This, in the second period, appears to have split into several alphabets, all related to each other, and pointing to a common Syriac origin (such as the different kinds of *Pehlevi* characters and the Zend alphabet) cleverly adapted to the use of a non-Semitic language. In the third period, we find the Arabic alphabet enlarged for Persian use by an addition of diacritical points and signs for such sounds as are not to be found in Arabic (*p*, *ch*, *zh*, *g*). The characters are written in a somewhat more pending manner (*Talik*) in Persian, and the writing is thus slightly different from the usual Arabic *Neskhî*.

The much-spoken-of close connection between German and Persian—both of Indo-Germanic kin—is neither more nor less than a popular fallacy, caused by a misunderstood dictum of Leibnitz: 'Integri versus Persice scribi possunt quos Germanus intelligat,' which was enthusiastically taken up and 'proved' by Adelung, Hammer-Purgstall, and others, and which has even led to the assumption, that the Germans came direct from Persia, or that the Goths once were mixed with the Persians. We only mention it as a philological absurdity of bygone days.

Of the Literature of the Persians before the

Mohammedan conquest, we shall not speak here, but refer to the special articles *ZARIF PARSY*, *PANOV*, &c. The literary period now under consideration is distinguishable by the above-mentioned infusion of Arabic words into the Persian language, imported together with the Koran and its commentaries. The writers are, in fact, one and all, Mohammedans. With the fanaticism peculiar to conquering religions, were particularly to Islam, all the representatives of old Persian literature and science, men and nation were violently persecuted by Omar's general, and the *Abi Wakkan*. The consequence was that for the first two or three centuries after the conquest, all was silence. The scholars and poets who would not bow to Allah and his Prophet and to the new order of things, and who had found means to emigrate, took with them what had not been discovered of the written monuments of their ancient culture; while those that remained at home were forced to abandon their wonted studies. Yet, by slow degrees, as is invariably the case under such circumstances, the conquered race began to understand the culture of the conquerors to such a degree, that native influences soon became predominant in Persia, even in the matter of theology—the supreme science. It is readily granted by later Mohammedan writers, that it was not so the body of the Persians exclusively that sprang the *Ismaelism*, if not all, the greatest scholars and authors on religious as well as grammatical subjects, historians and poets, philosophers and men of science; and the only concession they made remained in their use of the newly-imported Arabic language. A further step was taken when, after the Islam away had passed, the Persians, under various native dynasties, returned also to the ancient language of their fathers during the first centuries of Mohammedanism. The revived national feeling, which must have been stirring for a long time previously among the masses, then suddenly burst forth in prose and in verse, from the lips of a thousand singers and writers. The literary life of Persia, the resurrection of which is thus to be placed in the 9th c. A.D., continued to flourish with unabated fertility during the five centuries, and produced a host of writers in every branch of science and belles-lettres, of whom we can only here give the most rapid of surveys, referring for the most important names to the special articles throughout this work. Beginning with poetry, we hear, under the rule of the third of the Sassanides, Naar (about 902), of Abul Hasan Rudaki, the blind, who rose by the king's favour to such an eminence that he had 200 slaves to wait upon him. Not little has remained of his 1,200,000 distichs, and of his metrical translation of *Odysseus's Fables*. About 1000 A.D., we have of Rabiun, the Diluvite prince, as the author of *The Psychology of History and Poems*. In the time of the Gassanides, chiefly under Mahmud, who surrounded himself with no less than 400 court-poets, we find those stars of Persian song, Anvari (1059), the author of *Hasan and Jari*, and 2000 other distichs, and Kassiabi in honour and praise of the king; further, Feruqi, who, besides his own poems, also wrote the first work on the laws of the Persian metrical art; and above all Firdusi (q. v.), that greatest epic poet, the author of the *Shah-Namak*, or *Book of Kings*: who led one of the most brilliant and romantic lives that ever fell to the lot of poets, and ended in forgotten and in misery. With him, but darkened by his brightness, flourished Esaki, his countryman, from the time of the Gassanides, and the most brilliant Persian song-writer, Asadi Addul Bowari, who, with his poems, well knew how to handle satire. The best

of the older mystic poets of that period is Rumi, sultan of 30,000 disciples, who for his poems (*Hasid*) has immolated almost 500,000 his disciples. Nizami (about 1000) is founder of the romantic epics; the greater part of his *Chamshah*, or collection of five romantic poems (*Chamshah and others, Mahommed and Laila, &c.*), being almost as well known in Europe as it is in the East; and to whom Kiasian (the king) presented for one of these poems no less than fourteen carriages. His grave at Ghazni is still visited by many a pious pilgrim. And here we must mention that the branch of eastern philosophical literature professionally cultivated in Persia is the mystic theosophical poetry, which, under theocratic influences, in glowing songs of love and hope, represented the mystery of eternal life and of the union of the soul with God (see *Ismaelism*). To this province we find chiefly connected poets like Saadi (about beginning of 13th c. A.D.) and Farid Addul Awar (about 1216), the renowned author of *Book of Kings* (Book of Counsel), a work containing the description of souls up to his day. His principal strength, however, lay in his mystic poems; and such is the depth and hidden meaning of his hymns, that the centuries after him, the whole Muslim world has looked forth with veneration and conjectures on the meaning of a great part of his sacred poetry. He died about 1290, more than a hundred years old, as a martyr. Greater still, in this peculiar field, is Djafar Khatun Rumi, born at Balkh (died 1200), the founder of a still existing most popular order of disciples (*Mawlawi*). His poem on *Contemplative Life* has made him the origin of oriental mysticism up to this day. He wrote also a great number of lyrical poems, which form, as far as they have been collected for this special purpose, a treasury for the faithful East. Asadi of Merv (died 1207) also deserves mention.

The 14th c. cannot better be closed than with Shokh Mullah Fakhri Nadi of Shiraz (died 1291), the first and unrivalled Persian didactic poet. His *Ismael and Qasim* (*Howe and Fruit-Garden*) are not only of Eastern but also of European celebrity, and most deservedly, embodying as they do all the mature wisdom, the grace and happiness of composition of a true poet, ripe in years as in experience. At the beginning of the 14th c., we meet several meritorious imitators of Saadi in didactic poetry.

But far above all these, as above all other Persian lyrical and erotic poets, shines Hafiz (q. v.), the 'Sugar-lip,' who sang of wine and love, and nightingales and flowers, and who so offended mock-piety, that it even would have tried to refuse him a proper burial, had not the oracle of the Koran interposed. After him, the full glory of Persian poetry begins to wane. Among those that came after him, stands highest Djami, who died in 1492, a poet of most varied genius, second only in every one of the manifold branches to his chief master—in panegyric to Rumi, in didactic to Saadi, in romance to Nizami, in mysticism to Djelal-ed-din, in lyric to Shaki; and he, with these and Firdusi, form the brightest representatives of Persian poetry. Most brilliant, however, is Djami as a romantic poet. Of prose works, we have by him a history of Sella, and an extremely valuable collection of apocryphal legends. Before concluding this branch of literature, we must take notice of the dramatic poetry of the Persians, which is not without merit, but of small extent, and to be compared principally with the ancient French mysteries.

Too numerous tales, stories, novels, anecdotes, ethnologies, and all the miscellaneous entertaining literature in which Persia abounds, and of which the best known, perhaps, are the adaptation of *Odysseus's*

Fables; Anvari Suhaili, by Husein Vais Kashifi; the *Tutinameh*, or Book of Parrots, a collection of fairy tales, by Nechshebi; the *Behari-Danish*, by Inajeth Allah, &c.—form a fit transition from poetry to prose, for little more is to be said of Persian poetry after the 15th century. Modern imitations of ancient classical works, such as the New Book of Kings, the *Shahinshah-Nameh*, which treats of modern Persian history; the *George Nameh*, which sings the English conquests in India, &c., are hardly worth pointing out in so brief a summary as ours. Of native writers on the poets, are to be named Dewlet Shah (who describes the poets from the 10th to the 15th centuries), Sam Mirsa (the poets of the 16th), and Luft Ali Beg (the poets of modern time). In prose, it is chiefly history which deserves our attention. Able rivals of the great Arabic historiographers sprang up at an early period. For the mythical times, or those of which no knowledge, save through a medium of half-legend, has reached later generations, Firdusi's gigantic epos remains the only source. But after the chroniclers we find Fadhl Allah Reshid Eddin, the vizier of Ghazan, born 1247 at Hamadan, who was executed in 1320. He wrote the *Collector of Histories*, in three volumes, to which he afterwards added a fourth geographical volume: a summary of the history of all Mohammedan countries and times, containing besides a complete history of sects. Worthy and contemporaneous rivals are Fachr Eddin Mohammed Bina Kiti, author of a universal history; and Khodja Abdallah Wassaf, the panegyrist, the model of grand and rhetorical style. His most successful imitator in the 14th c. is Abdel Ressaik; and in the 15th, Sheref Eddin Ali Yezdi, who wrote the history of Timûr. Up to that period, pomposity of diction was considered the principal beauty, if not the chief merit, of a classical Persian history. From the 15th c. downwards, a healthy reaction set in, and simplicity and the striving after the real representation of facts, became the predominant fashion. As the *facile princeps* among these modern historians is to be mentioned Mirkhond, whose Universal History (*Ranset Essafa*) comprises the period from creation to the reign of Sultan Hasan Beikara, in seven books. After him are to be mentioned his son Khondemir, Gaffari, Moslih Eddin Mohammed Lari, and Abu Tahir of Tortosa in Spain, who wrote the *Derab Nameh*, a biographical work on the Persian and Macedonian kings, and the ancient Greek physicians and philosophers.

Among Indian historians—and they form a most important class—who wrote in Persian, we have Mohammed Kasim Ferishtah (1640), who wrote the ancient history of India up to the European conquest; Mohammed Hashim, Abul Fadel Mobarrek (*Akbar Nameh*); further, Abdel Ressaik (*History of the Padishahs*), Mirza Mehdi, Gholam Hussein Khan, and others. One of the most recent works of this description is the *Measiri Sultaniye*, which contains the history of the present dynasty of Persia, and which was published in Teheran, 1825, and translated by Bridges (Lond. 1833).

Biographies, legends, histories of martyrs, and the like are legion. Most of the biographies of the Prophet, however, are taken from the Arabic.

Little is to be said of Persian productions on special branches of exact science. There are a few works on geography—more generally treated together with history—such as those of Mestafi, Ahmin Ahmed Rasi, Berdshendi, &c. In theology, little beyond translations of the Koran, and a few commentaries on single chapters, and of some portions of the Traditions (*Sunnah*), has been produced—the Arabic works being completely sufficient, in religious matters, for all Mohammedans.

For the history of early Persian religion are of importance the *Ulemai Islam* and the *Dabistan*, a description of all the creeds of the East. Jurisprudence has likewise to shew little that is original, and not mere translation, partial commentary, or adaptation in Persian. The *Hedadshah*, the *Inadshah*, the *Futawa Alemgiri*, are the most important legal works to be mentioned here. A great deal has been done in the field of medicine, surgery, pharmacy, physical sciences, by Persians; but nearly all their chief works being written in Arabic, they do not concern us here. Mathematics, astronomy, and philosophy, have received due attention; rhetoric, the art of letter-writing, metrical and poetical arts, have likewise been cultivated with great assiduity, but few standard works are to be enumerated. Grammar and lexicography found their principal devotees in India; and of dictionaries, the *Farheagi-Shiuri*, *Burhani Katiu*, and principally the *Heft Kulzum* (the Seven Seas), by the Sultan of Oude, deserve attention. Translations from Greek, Indian, Arabic, Turkish, and other works into Persian, exist in great abundance, and some of them have paved the way to the knowledge of the original sources in Europe.—Chief authorities and writers on the subject of Persian Language and Literature, are Meninsky, Richardson, Lumsden, Forbes, Ibrahim De Lacy, Hammer-Purgstall, Briggs, Jones, Duperron, Stewart, Quatremere, Wilken, Defrémery, Vuellers, Iken, Kosegarten, Ouseley, Chodzko, Bland, Sprenger, Graff, Brockhaus, Dorn.

PERSIAN POWDER, a preparation of the flowers of the composite plant, *Pyrethrum carneum* or *roseum*, which are dried and pulverised. This powder has wonderful efficacy in destroying noxious insects, and is extensively used for that purpose in Russia, Persia, and Turkey. It has lately been introduced into France and Britain, and promises to be of great use, not only in ridding houses of their insect pests, but in aiding the horticulturist in protecting his plants. The plant is a native of the Caucasus, where the flowers are gathered wild, and sent to be manufactured chiefly at Teflis. It might readily be cultivated in this country, where its value for destroying moths alone would render it a profitable crop. Its habit is very similar to that of camomile.

PERSIGNY, JEAN GILBERT VICTOR, COMTE DE, whose proper name is FIALIN, a noted adherent of the Emperor Napoleon III., was born at Saint-Germain-Leopinaise, in the département of Loire, 11th January 1808, entered the *École de Cavalerie* at Saumur in 1826, and obtained an appointment to the 4th regiment of hussars in 1828. At this period, Fialin was royalist in his politics; but he soon changed to a liberal, and took an active part in the July revolution. Insubordination, however, led to his final expulsion from the army in 1833. After a brief trial of Saint-Simonianism, Fialin was converted to the Bonapartist cause, dropped the name of Fialin, and took up that of P. (from an 'hereditary estate'), with the title of Vicomte. Introduced to Louis Napoleon by the ex-king Joseph, he at once formed the most intimate relations with the Prince, and commenced a career of Bonapartist propaganda throughout France and Germany, in which he displayed extraordinary energy, pertinacity, and fertility of resource. He had the chief hand in the affair of Strasburg, and subsequently apologised for its humiliating failure in a pamphlet entitled *Relation de l'Entrepise du Prince Napoleon Louis* (Lond. 1837), in which he throws the blame of the disaster on 'Fate.' He also took part in the descent on Boulogne, where, like his master, he had the misfortune to be captured, and was condemned to twenty years'

represented. His confidence, however, after a short time became almost unshaken, and he brought his letters by literary study, a partial result of which may be seen in his voluminous memoirs, addressed to the Institute, on the *Histoire des Personnes d'Espagne* (1844). On the breaking out of the revolution in 1848, P. retired to Paris, and set himself with all his accustomed vigour and swiftness, to organize the Bonapartists. It is hardly too much to affirm that it was this dangerous agitator who made his master President of the Republic. He was then appointed aide-de-camp to the President, and then general of the French National Guard—perhaps with a view to future contingencies. In 1850, he was chosen a member of the Legislative assembly, and immediately signalled himself in parliament, as he had previously done out of doors, by his absolute devotion to the policy of the Empire. He was sent to Berlin as ambassador in the close of the same year, and afterwards held other high diplomatic offices, took a prominent part in the coup d'état of December 1851; and, in January 1852, succeeded M. de Morny as Minister of the Interior. On the 27th of May following, he married a grand daughter of Marshal Ney, when the president conferred on him the title of Count, and presented him with 200,000 francs. In 1855, he became ambassador at the English court, which office he held till 1858, and again during 1859—1860, leaving on both occasions the most favourable impression on English statesmen by his talent and diplomatic tact. In all political emergencies, he has been the most confidential and the soundest adviser of the emperor; he has also entered heartily into his liberal commercial reforms; and though an implacable opponent of the extreme or anarchic republicans, he is like a true disciple of Bonaparte, far from disposed to let the ultramontane party of the church have things their own way, his sharp treatment of the *Société de Saint Vincent de Paul* (1858 October 1861) demonstrated.

PERSONION. See DATE PLUM.

PERSONIUS (Aulus Persius Flaccus), one of the most famous Roman satirists, was born at Volturne in Campania, 64 A.D. He was of a distinguished equestrian family, was educated under the care of his uncle, Coreudius, lived on terms of intimacy with the most distinguished personages of his time in Rome, among whom were Lucan and Seneca, and died 46th November 63 A.D., in the 25th year of his age. The principal authority for the life of P. is an acknowledgment of a 'commentary' by one Probus Valerius, which presents the character of the satirist in a most availing light. Modest and gentle in his manners, virtuous and pure in his whole conduct and relations, he stands out conspicuously from the mass of corrupt and profligate persons who formed the Roman society of his age, and vindicated for himself the right to be severe, by leading a blameless and exemplary life. His six satires are very uniformly treated with views of Juvenal. They were immensely admired in P.'s own day, and long after, all down through two middle ages. The Church Fathers, Augustine, Lactantius, and Jerome, were particularly fond of him—the latter, it is said, has quite surpassed his style with the expressions of the Christian satirist, but the estimate which modern critics have formed of his writings, in a literary point of view, is not quite so high. They are remarkable for the sternness with which they condemn the corruption of morals then prevalent in Rome, contrasting it with the old Roman severity and with the Stoic ideal of virtue. The language is terse, lively, and sometimes obscure, and the names of the allusions and the expressions

used, but his dialogues are the most dramatic in the Latin tongue. The *edidit personae* appeared at Rome in 1470; later editions are those of Jean Cassiodorus (Paris, 1635), Passer (Lips. 1635), Jahn (Lips. 1843), and Henrich (Lips. 1843). P. has been frequently translated; as many as fourteen English, twenty French, and considerably more German versions being known. The two best English ones are those by Dryden and Gifford.

PERSON (Lat. *person*, a mask) has come, from its original signification, to be applied to the individual wearing the mask, and thus to cover in general an individual, or a numerically distinct being. Beyond the idea of individuality, it involves that of a soulless or intelligent nature, in which it differs from 'substance' or 'being.' The theological use of the word, although strictly identical with its philosophical signification, is made difficult of apprehension from its being applied to the Christian doctrine of the Trinity, which in itself involves a mystery. Nevertheless, when theologians declare that there are Three Persons in one God, they intend to signify merely that each of the Three Persons is a being individually existing and numerically distinct; and the difficulty of apprehension is derived, not from these terms, but from the reconciliation of the numerical distinction of Persons with the unity of the Divine Nature.

The name *Personae*, *Person*, was first applied to the Trinity by the Latins; the corresponding Greek word, *Prosopon*, being of later use. The earlier Greek Fathers used the word *Hypostasis*, substance, where the Latins used *Personae*, and considerable controversy for a time grew out of this difference. It became apparent, however, that the difference was but of words; and after the condemnation of the Eutychian heresy (see SACRILEGIOUS), and still more after the council of Nicea, all ambiguity of words being at an end, the controversy turned upon the substance of the doctrine, in the well-known form of the Arian controversy. See ARIAN.

PERSONAL ACTIONS, in English Law, are actions which are brought to try the right to damages for breach of contract, or for injuries to the person or personal estate; in contradistinction to real actions, which were designed to try the right and title to real property.

PERSONAL EXCEPTION means, in the Roman law, a ground of objection which applies to an individual, and prevents him doing something which, but for his conduct or situation, he might do. The term is adopted in the law of Scotland. In England, it is generally called an estoppel. Thus, a person who executes a deed is prevented by personal exception or estoppel from disavowing the obligation thereby contracted, unless a case of fraud be made out.

PERSONALTY, in English Law, means all the property which, when a man dies, goes to his executor or administrator, as distinguished from the realty, which goes to his heir-at-law. Personality consists of money, furniture, stock in the funds; while realty consists of freehold land and rights connected with land. See INTESTACY, KIN, NEXT OF KIN.

PERSONIFICATION (called by the Greeks *Prosopopoeia*) is a figure of rhetoric by which inanimate objects, or more abstract conceptions, are invested with the forms and attributes of conscious life. Oratory and poetry often derive great power and beauty from the employment of this figure. Nowhere do we find more sublime examples than in the Hebrew *Megillahs*, e.g., 'The sea saw it, and fled.' Such abstract conceptions as Wisdom, Justice,

PERSONNEL—PERSPECTIVE.

Charity, are often personified in the gravest and most argumentative compositions.

PERSONNEL, in speaking of an army, represents the officers and soldiers, as opposed to the *matériel*, in which are comprised the guns, provisions, wagons, and stores of every description.

PERSPECTIVE (Lat. *perspicio*, I look through), is the art of representing natural objects upon a plane surface in such a manner that the representation shall affect the eye in the same way as the objects themselves. The distance and position of objects affect both their distinctness and apparent form, giving rise to a subdivision of perspective into *linear perspective*, which, as its name denotes, considers exclusively the effect produced by the position and distance of the observer upon the apparent form and grouping of objects; while *aërial perspective* confines itself to their distinctness, as modified by distance and light. The necessity of attending to the principles of perspective in all pictorial drawing is apparent when we consider, for instance, that a circle, when seen obliquely, appears to be not a circle, but an ellipse, with its shortest diameter in line with the spectator, and its longest at right angles to this. A square, when looked at from a position opposite the centre of one of its sides, appears as a trapezoid, the sides which are perpendicular to the direction of vision appearing to be parallel, while the other two appear to converge to a point in front of the spectator, &c. For the same reason, two rows of parallel pillars of equal height, seen from a point between and equidistant from each row, appear not only to converge at the further end, but to become gradually smaller and smaller. An excellent idea of a perspective plan can be easily obtained by interposing a vertical transparent plane (as of glass—a window, for instance) between the observer and the objects of his vision, and supposing that the objects he sees are not seen through the glass, but painted on it. A sketch made on a glass plane in this position by following with a pencil all the lines and shades of the objects seen through it, the eye being all the time kept quite steady, would form a picture in perfect perspective. In practice, however, it is found, unfortunately, that glass is not a suitable material for sketching on, and that the vertical position is not the most convenient; it is therefore preferable to make a careful study of the effects produced by change of position and distance on the appearance of objects in nature, and from the results of this to compile a body of rules, by the observance of which painters may be enabled to produce an effect true to nature. After the 'scope' (i. e., the number of objects to be introduced, and the distance at which they are to be viewed) of the picture has been determined, and before the design is commenced, it is necessary to draw upon the perspective plan three lines: 1. The *base line*, or *ground line*, which limits the sketch towards the operator, and is the base line of the picture. 2. The *horizontal line*, which represents the ordinary position of the sensible horizon. The height of the horizontal line is about one-third of the height of the picture, when the sketcher is placed at or little above the level of the horizon; but it may rise in a degree corresponding to his increase of elevation till it reaches near to the top of the perspective plan. The general rule is to have a high horizontal line when the view is taken, or supposed to be

taken, from an eminence; but when the station is on a level, either actual or assumed, as is the case when a statue or a mountainous landscape is figured, the horizontal line must be low. The horizontal line in nearly all cases is supposed to be level with the spectator's eye. 3. The *vertical line*, which is drawn from the supposed position of the sketcher, perpendicular to the ground and horizontal lines, meeting the latter in a point which is called the *point of sight*, or centre of the picture. The vertical line has no representative in nature, and is merely a mechanical adjunct to the construction of the picture, all vertical lines in nature being parallel to it in the picture. The point of sight being the point directly opposite to the observer, is properly placed in the centre of the picture, for it is most natural that the view should lie symmetrically on each side of the principal visual line; but this is not by any means a universal rule, for we very frequently find it on the right or left side, but always, of course, on the horizontal line. All lines which in nature are perpendicular to the ground line, or to a vertical plane which is raised upon it as a base, meet in the point of sight, which is thus their *vanishing point* (see the line of the tops and bottoms of the pillars in fig. 1). The *points of distance* are two points in the

Fig. 1.

Illustrating the more important points and lines; P.V.R. is the principal visual ray.

horizontal line on each side of the point of sight, and in a 'direct' sketch are at a distance from it equal to the horizontal distance of the sketcher's eye from the ground line. The equality of distance of these points from the point of sight is not, however, necessary, as it occurs only in those cases where the lines, of which the points of distance are the *vanishing points*, are inclined (in nature) at an angle of 45° to the base line; but, in all cases, the two points of distance are about twice as far apart as the eye is from the picture. One important use of the points of distance is to define the distance of objects in a row (fig. 1) from each other. For this purpose, two points of distance are not necessary, as, when the position of one pillar is found, that of the one opposite is at once obtained by drawing a line parallel to the base or ground line. We have seen that the point of sight is the *vanishing point* of all level lines which meet the ground line or a vertical plane on it at right angles, and that the points of distance (in a *direct* picture) are the *vanishing points* of all lines which cut the ground line at an angle of 45°; but there are many other groups of parallel lines in a picture which have different situations, and therefore different *vanishing points*. Such lines with their *vanishing points* (called, for distinction's sake, *accidental points*) are represented in fig. 2. If the accidental point is above the horizontal line, it is called the *accidental point aerial*—if below, the *accidental point terrestrial*; and a little consideration makes it evident that these points may or may not be situated within the plane of the picture. Such are the points and lines necessary for the construction of a plan in true perspective; and from the above explanation, we may deduce the two general principles: 1. That all parallel straight lines in nature are no longer parallel when projected on the

perspective plane, but meet in a point which is called the vanishing point, and is some one of the three planes described, unless these lines happen to become parallel to the ground line or the vertical line, in which case they remain parallel when transferred

PERTH, a city, royal, municipal and parliamentary burgh, and capital of the county of the same name, is situated on the right bank of the Tay, 45 miles north-north-west of Edinburgh, by railway (through Fife). The charming scenery of the

immediate vicinity; the Tay, a broad and noble river, sweeping southward along its eastern side, and the superb background of the Grampians on the north, render the site of the 'Fair City' exceedingly interesting and beautiful, while the park on its eastern side is in some sort the ancient metropolis of Scotland, the important rôle it has played in the history of the

Fig. 2.

The lines that converge to the vanishing point, and P.P. to the vertical point, represent.

to the picture) and 2. That since the bodies drawn below the horizontal line are seen as if from above, those above as if from below, and those to the right and left of the point of sight as if observed from the left and right, it follows, that straight lines which in the picture are above the horizontal line lower themselves, those below raise themselves to it; those in the left, following the same law, direct themselves to the right, and vice versa.

Aerial perspective, consists in a modulation of the brightness and colours of objects in accordance with the state of the atmosphere, the depth of the body in the perspective plane (i.e., distance in space from the ground line), and other accidents of place and time. As the distance of objects increases, their illuminated parts are made less brilliant, and their shaded parts more feeble. The hues not imparted by a large mass of the atmosphere to the bodies seen through it, is frequently softened by the mixing of a slight tint of blue with the colours to be applied; a yellow object thus assumes a greenish tint; a red one, a violet tint, &c. The air, when charged with vapour, is represented by a diminution of the brightness of colours, and by the grayish tint imparted to them. But in the part of the subject, rules are of little avail, for experience alone can guide the painter in faithfully copying the myriad aspects presented by nature.

A thorough knowledge of perspective is a star yet new to the painter or designer, and though many are inclined to think it a superfluity, and too the sketcher has only to make use of his eyes, and copy faithfully, the very last that such is their opinion, shows that they have never made the attempt; for it is impossible for the painter, and much more so for the designer, to create a copy of nature with sufficient accuracy by the sole aid of the eye and hand, a fact that is unfortunately much too frequently proved by many of the sketches exhibited in fine-art collections. Perspective was known to the ancients, but seems to have become almost lost during the disturbances that convulsed Italy, and was revived by Albert Dürer, Pietro del Verone, and Bramante of Milan (1460), whose body of rules was extended and completed by Verone and Ughioli about 1600. Dr Brook Taylor was the first Englishman who discussed the subject systematically. Works on perspective are now abundant in every language.

PERSPIRATION. See SWEAT.

country, and the picturesque associations with which history and fiction have invested it, claim for it a high rank among the cities of Scotland. A handsome bridge of nine arches, 800 feet in length, and stretching over a water-way 500 feet in width, connects the town with the suburb of Bridgend, on the left bank of the river. Formerly the Perth and Dundee Railway crosses the river on a fine stone and iron bridge (opened in 1864), which also admits foot-passengers. The appearance of P. is much enhanced by two beautiful public parks, called the North and South Lawns. The water-supply, obtained from the Tay, is filtered, raised by steam into two elevated reservoirs, and thence distributed over the town, rising to the upper stories of the highest houses. Among the most interesting public buildings are the church of St John, an ancient structure in the Pointed Style, surmounted by a massive square tower; the County Buildings, a Grecian edifice; the local prison, and the Penitentiary or General Prison, formerly used as a dépôt for French prisoners, and now one of the largest buildings of the kind in Scotland. The Penitentiary is the General Prison for Scotland, and all criminals sentenced to imprisonment for long periods are confined here. The town also contains a statue of the late Prince Consort, erected in 1894; Marshall's Monument, erected in honour of a former lord provost, and containing a public library and the Museum of the Antiquarian and Natural History Society; Sharp's, and other educational institutions. The river is navigable to P. for vessels of considerable burden. Winey and striped shirting are manufactured; gloves, which at one time were a staple manufacture, are no longer made. There are dye-works, iron-foundries, breweries, &c.; and ship-building is also carried on. The salmon-fishery on the Tay is very valuable (250 tons of fish being exported annually to London alone). In 1863, 372 vessels, of 25,301 tons, entered and cleared the port. Five fairs are held annually, and horse-races take place every year on the North Inch. P. has a charter as a royal burgh from King William the Lion (1165–1214). It returns a member to the House of Commons. Pop. (1861) of royal burgh, 13,814; of parliamentary burgh, 23,250.

PERTH, the Five Avenues of, memorable in the ecclesiastical history of Scotland, were five articles agreed upon in a meeting of the General Assembly of the Church of Scotland, convened at

Perth, by command of James VI., on 25th August 1618. These Articles enjoined kneeling at the Lord's Supper, the observance of Christmas, Good Friday, Easter, and Pentecost, and confirmation, and sanctioned the private administration of baptism and of the Lord's Supper. They were highly obnoxious to the Presbyterians of Scotland, not only on their own account, but as part of an attempt to change the whole constitution of the church; and because they were adopted without free discussion in the Assembly, and in mere compliance with the will of the king, who was also regarded as having unduly interfered with the constitution of the Assembly itself. They were, however, ratified by the parliament on 4th August 1621—a day long remembered in Scotland as *Black Saturday*—were enforced by the Court of High Commission, and became one of the chief subjects of that contention between the king and the people, which produced results so grave and sad for both, in the subsequent reign. The General Assembly of Glasgow, in 1638, declared that of Perth to have been 'unfree, unlawful, and null,' and condemned the Five Articles.

PERTHES, FRIEDRICH CHRISTOPH, an eminent German publisher, distinguished not only in his professional capacity, but for his sincere piety and ardent patriotism, was born at Rudolstadt, 21st April 1772. In his 15th year, he was apprenticed to a Leipzig bookseller, with whom he remained six years, devoting much of his leisure time to the acquisition of knowledge. In 1793, he passed into the establishment of Hoffmann, the Hamburg bookseller; and in 1796, started business on his own account; and, by his keen and wide appreciation of the public wants, his untiring diligence, and his honourable reputation, he ultimately made it the most extensive of the kind in modern Germany. During the first few years or so of his Hamburg apprenticeship, his more intimate friends had been either Kantian or sceptical in their opinions, and P., who was not distinguished for either learning or speculative talent, had learned to think with his friends; but a friendship which he subsequently formed with Jacobi (q.v.), and the Holstein poet and humorist, Matthias Claudius, led him into a serious but liberal Christianity. The iron rule of the French in Northern Germany, and the prohibition of intercourse with England, nearly ruined trade, yet P., even in this great crisis of affairs, found ways and means to extend his. He endeavoured to enlist the intellect of Germany on the side of patriotism, and in 1810 started the *National Museum*, with contributions from Jean Paul Richter, Count Stolberg, Claudius, Fouqué, Heeren, Sartorius, Schlegel, Görres, Arndt, and other eminent men. Its success was far beyond P.'s expectations, and encouraged him to continue his patriotic activity, till Hamburg was formally incorporated with the French empire. He subsequently took a prominent part in forcing the French garrison to evacuate Hamburg, 12th March 1813; and on its re-occupation by the French, he was one of the *ten Hamburgers* who were specially excepted from pardon. After peace had been restored to Europe, P. steadily devoted himself to the extension of his business, and to the consolidation of the sentiment of German national unity, as far as that could be accomplished by literature and speech. In 1822, he removed to Gotha, transferring his Hamburg business to his partner Besser. Here he laid himself out mainly for the publication of great historical and theological works. His subsequent correspondence with literary, political, and theological notabilities—such as Niebuhr (one of his dearest friends), Neander, Schleiermacher, Lücke, Nitzsch, Tholuck, Schelling, and Umbreit—

is extremely interesting, and throws a rich light upon the recent inner life of Germany. He died 18th May 1843.—See *Friedrich Perthes' Leben* (12th edit. 1853), written by his second son, Clemens Theodor Perthes, Professor of Law at Bonn.—The uncle of Friedrich Christoph P. was JOHANN GEOR. JUSTUS PERTHES, who established a publishing and bookselling house at Gotha in 1785, which has acquired, in the hands of his sons, a great reputation, and from which issues the famous *Almanaeh de Gotha*.

PERTSHIRE, one of the most important counties in Scotland, is bounded on the S. by the shires of Stirling and Clackmannan; on the N. by Inverness and Aberdeen; on the W. by Argyle and Dumbarton; and on the E. by Forfar, Fife, and Kinross. It extends from east to west about 70 miles, and from north to south about 65 miles. Its area is 2834 miles, or 1,814,063 acres, of which above 32,000 are covered with water. It is divided into the Highland and Lowland districts, the former occupying much the larger surface, and these are subdivided into 10 divisions—viz., Menteith, Strathearn, Gowrie, Stormont, Strathardle, Glenshee, Athole, Breadalbane, Rannoch, and Balquidder. P., from its insular position and other advantages, has a comparatively mild climate; and the soil, in Strathearn, Cars of Gowrie, and other less extensive tracts, being mostly composed of a rich loam, crops of all kinds are brought to the utmost perfection. These districts are also famed for their fruit and floral productions. P. is not less distinguished for its magnificent mountain, lake, and river scenery. The Grampians here attain to nearly their maximum height, Ben Lawers being within a few feet of 4000 in altitude; while Ben More is 3818; and several others above 3000. The lakes are numerous, the principal of which are Lochs Tay, Erich, Rannoch, Tummel, Lydell, Garry, Lyon, and Dochart. There are several streams of note, the principal being the Tay, which is fed by numerous other streams, and is said to discharge as much water into the sea as any other river in the kingdom. These lakes and streams afford excellent fishing, and the Tay is valuable for its salmon, yielding in rent about £12,000 a year.

According to the last agricultural statistics, taken in 1857, the number of occupants was 3616, and the acreage under rotation of grass and hay was 99,656, and under crops 267,397; of which there were in wheat, 25,638 acres, averaging 25 bushels $3\frac{1}{2}$ pecks per acre; in barley, 18,802 acres, averaging 31 bushels $\frac{1}{2}$ peck per acre; in oats, 64,044 acres, averaging 35 bushels $\frac{1}{2}$ peck per acre; in bere, 655 acres, averaging 30 bushels $3\frac{1}{2}$ pecks per acre; in beans and peas, 4250 acres, averaging 21 bushels $3\frac{1}{2}$ pecks per acre; in turnips, 33,313 acres, averaging 13 tons per acre; in potatoes, 17,482 acres, averaging 2 tons $11\frac{1}{2}$ cwt. per acre. Of live stock there were—horses, 15,953; cattle, 80,716; sheep, 544,742; swine, 9369.—Total stock, 650,780.

The above statistics shew that there are more occupants or tenants in this county than in any other in Scotland with the exception of Aberdeen, where there are more than double the number: that the acreage under crop is also greater, with the above exception; while the average produce of wheat, barley, and turnips is less than in 24 out of the 32 counties. Of oats the average is less than in 14 counties, and of potatoes less than in 22. The live stock exceeds in value any other county, Aberdeen excepted, and outnumbers all except Argyle, which possesses 827,000 sheep. The old valued rental was £28,330; the new valuation for 1862–1863 was £732,766, exclusive of railways. The rate of

minerals on the land for 1853-1864 amounted to 14, 24, per cent.

The old Roman settlements, grants, and estates abound in this county are situated some at the isolated distance of 100 miles, but, except during 1-250, none of them contain any historical remains; and the general interest in the antiquaries are confined to the ruins of the Roman and British, the Abbey of Evesham, and a few Druidical and Roman remains. There are, however, two royal burials, North and Chelms, within which there are several villages of considerable size, where trade in flax, &c. is carried on to some extent. The population in 1841 was 122,500; estimated houses 25,000; parliamentary constituency in 1865, was 12,041.

PERTINAX, Marcus, Roman emperor, was son, according to Dio Cassius, of Albinus Pompeius, a native of Africa. August 1, 193 A.D. He assumed a great education, and, entering the military service, rose through the various grades till he obtained the command of the first legion, at the end of which he distinguished himself in Britain and against the native tribes. In 178, he was again raised, asked to suppress the revolt of Avidius Cassius, and was governor successively of the provinces of Africa, Gaul, and Syria. Being sent by the Emperor Commodus to take the command of the rebellious legions in Britain, those troops, against his will, proclaimed him emperor, on which he returned to be recalled, and was appointed governor of Africa, province of Rome, and consul (honorary) in 192. On the death of Commodus, his assassin forced P. to desert to the people, which with great hesitation he did; he is said to have perished of a large dagger in his breast to gain over the praetorian guard, the execution was, however, hailed with delight by the senate and people, who were rejoiced to see, as rulers, an able captain, instead of a weak and debauched one. P. encouraged by this successful reception, announced his intention of reforming not an extensive series of reforms, having been chiefly to the army, in which he hoped to re-establish the ancient Roman discipline. Unfortunately for his reforms and himself, he was attacked by a band of the rebellious provinces, two months and twenty-seven days after his accession; and, according to this, was slain and his head carried off to the streets of Rome in triumph. From his bones nothing can be gathered respecting his character and talents (except in military affairs); but the senate and people in which he was loved by the senate and people of Rome, argue well in favour of his disposition.

PERTURBATIONS, in Physical Astronomy, are the disturbances produced in the simple elliptic motion of one heavenly body about another, by the action of a third body, or by the non-sphericity of the primary body. Thus, the motions were those he would in space except the earth and moon, the moon would describe accurately an ellipse about the earth's centre as focus and its radius-vector would pass over equal areas in equal times; but only if both bodies be homogeneous and truly spherical, or if their constituent matter otherwise so arranged that they may attract each other as if each were reduced to some definite point of its mass. The oblateness of the earth's figure, therefore, produces perturbations in what would otherwise be the fixed elements of the moon. Again, when we consider the moon's motion, it is obvious that in no position of the moon does the sun act equally upon both earth and moon; but at one moon, the moon is nearer to the sun than the earth is, and is therefore more attracted on proportion to the mass than the earth

—that is, the difference of the sun's action on the earth and moon is equivalent to a force tending to draw the moon away from the earth. At full moon, on the other hand, the earth (in proportion to its mass) is more attracted than the moon is by the sun; and the perturbing influence of the sun is again of the nature of a force tending to separate the earth and moon. About the quarters, on the other hand, the sun's attraction (taken for along) is nearly the same in amount on the earth and moon, but the direction of its action is not the same on the two bodies, and it is easy to see that in this case the perturbing force tends to bring the earth and moon nearer to each other. For any given position of the moon, with reference to the earth and sun, the difference of the accelerating effects of the sun on the earth and moon is a disturbing force; and it is to this that the perturbations of the moon's orbit, which are the most important, and amongst the most considerable, in the solar system, are due. [By the word *disturbance*, just employed, we are of course to understand, not the accidental differences, but the resultant of the sun's direct acceleration of the moon, combined with that on the earth considered in direction and magnitude; so it is only with the relative motions of the earth and moon that we are concerned.] This disturbing force may be resolved into three components; for instance, we may have one in the line joining the earth and moon, another parallel to the plane of the ecliptic, and perpendicular to the moon's radius-vector, and a third perpendicular to the plane of the ecliptic. The first component, as we have already seen, tends to separate the earth and moon at new and full, and to bring them closer at the quarters; but during a whole revolution of the moon, the latter tendency is more than neutralised by the former; that is, in consequence of the sun's disturbing force, the moon is virtually less attracted by the earth than it would have been had the sun been absent. The second component mainly tends to accelerate the moon's motion in some parts of its orbit, and to retard it at others. The third component tends, on the whole, to draw the moon towards the plane of the ecliptic. We cannot, of course, enter here into even a complete sketch of the analysis of such a question as this; but we may give one or two very simple considerations which will, at all events, indicate the nature of the grand problem of perturbations.

The method, originally suggested by Newton, which is found on the whole to be the most satisfactory in these investigations, is what is called the *Variation of Parameters*, and admits of very simple explanation. The path which a disturbed body pursues is, of course, no longer an ellipse, nor is it in general either a plane curve or re-entrant. But it may be considered to be an ellipse which is undergoing slow modifications in form, position, and dimensions, by the action of the disturbing force. In fact, it is obvious that any small arc of the actual orbit is a portion of the elliptic orbit which the body would pursue for ever afterwards, if the disturbing forces were suddenly to cease as it moved in that arc. The parameters, then, are the elements of the orbit; that is, its major axis, semimajor, longitude of apse, longitude of node, inclination to the ecliptic, and epoch; the latter quantity indicating the time at which the body passed through a particular point, as the apse, of its orbit. If these be given, the orbit is completely known, with the body's position in it at any given instant. If there be no disturbing forces, all these quantities are constant; and therefore, when the disturbing forces are taken into account, they change very slowly, as the disturbing forces are in most cases very small. To give an instance of the nature of these

changes, let us roughly consider one or two simple cases. First, to find the nature of some of the effects of a disturbing force acting in the radius-vector, and tending to draw the disturbed, from the central body. Let S be the focus, P the nearer apse, of the undisturbed elliptic orbit. When the moving body passes the point M , the tendency of the disturbing force is to make it describe the dotted curve in the figure—i. e., the new direction

Fig. 1.

of motion will make with the line MS an angle more nearly equal to a right angle than before; and therefore the apse Q in the disturbed orbit will be sooner arrived at than P would have been in the undisturbed orbit—that is, the apse *regre-des*, or revolves in the contrary sense to that of M 's motion. Similarly, the effect at M_1 is also to make the apse regre-de to Q_1 . At M_2 and M_3 , on the other hand, the tendency is to make the apse progrede. Also, as the velocity is scarcely altered by such a force, the major axis remains unaltered. Thus at M the eccentricity is diminished, and at M_1 increased, since the apsidal distance is increased at M , and diminished at M_1 .

Next, consider a tangential accelerating force. Here the immediate effect is to increase the velocity at any point of the orbit, and therefore to make it correspond to a larger orbit, and, consequently, a longer periodic time. Conversely, a retarding force, such as the resistance of a medium, diminishes the velocity at each point, and thus makes the motion correspond to that in an ellipse with a less major axis, and therefore with a diminished periodic time. This singular result, that the periodic time of a body is *diminished* by resistance, is realised in the case of Encke's comet, and this observed effect furnishes one of the most convincing proofs of the existence of a resisting medium in interplanetary space.

Again, the effect of a disturbing force continually directed towards the plane of the ecliptic, is to make the node regre-de. Thus, if $N'N$ represent

Fig. 2.

the ecliptic is diminished, when the planet has just passed the ascending node. In the second figure, let M_1 be a position of the planet near the descending node N_1 . The effect of the disturbing force is to alter the orbit to MN_1' . Thus, again,

the node regre-des, but the inclination is increased. If NN' and N_1N_1' in these figures represent the earth's equator, the above rough sketch applies exactly to the case of the moon as disturbed by the oblateness of the earth. The reaction of the moon on the earth gives rise to the Precession of the Equinoxes.

Fig. 3.

By processes of this nature, Newton subjected the variation of the elements of the moon's orbit to calculation, and obtained the complete explanation of some of the most important of the lunar inequalities. See MOON. Others of them—for instance, the rate of progression of the apse—cannot be deduced with any accuracy by these rough investigations, but tax, in some cases, the utmost resources of analysis. Newton's calculation of the rate of the moon's apse was only about half the observed value; and Clairaut was on the point of publishing a pamphlet, in which a new form was suggested for the law of gravitation, in order to account for the deficiency of this estimate; when he found, in carrying his analysis further, that the exact result sought is obtainable in the form of a slowly converging series, of which the second term is as large as the first. The error of the *Nautical Almanac*, founded almost entirely on the observation, rarely amounts to a second of time; the moon's place is predicted four years hence in the *Nautical Almanac*, with a degree of precision which no mere observer could attain even one day to the next. This is the true proof, not only of the law of gravitation, but of the Law of Motion (q. v.), upon which, of course, the astronomical investigation is based.

With respect to the mutual perturbations of the planets, we may merely mention that they are divisible into two classes, called *periodic* and *secular*. The former depend upon the configuration of the system—such, for instance, is the diminution of the inclination of the moon's orbit, after passing the ascending node on the earth's equator, and the increase, or its increase as the moon comes to the descending node. The secular perturbations, upon the period in which a complete series of alternations have been gone through, and in the case of the planets, complete cycles are occupied by hundreds of years.

A very curious kind of perturbation is said to be the *indirect* action of the planets on the earth. There is a secular change of the eccentricity of the earth's orbit, due to planetary action, which brings the sun, on the average, nearer to the earth and moon for a long period of years, then the equal period takes it further off. One of the effects of the sun's disturbing force being, as we have seen, to diminish, on the whole, the moon's distance towards the earth, this diminution will counteract the same period as the eccentricity of the earth's orbit; and therefore the moon's mean distance will be alternately accelerated and retarded, each occupying an immense period.

With special reference to the planetary motions, we may notice that the major axis of each planet's orbit is free from all secular variations; and that, affecting the inclination and eccentricity are confined within small limits, and ultimately counteract themselves. These facts, which have been and beautifully demonstrated by Laplace and Lagrange, assure the stability of the planetary orbits, if we neglect the effects of resistance d.

the interplanetary matter; which, however, must, in the long run, bring all the bodies of the system into collision with the sun, and finally stop the rotation of the sun itself.

Newton commenced the investigation of perturbations by considering those of the moon; Euler followed with a calculation of Saturn's inequalities; while Clairaut, D'Alembert, and others successively gave those of the other planets.

Every one knows that it was by observing the perturbations of Uranus, and thence discovering the direction of the disturbing force, that Adams and Leverrier were led to their great and simultaneous discovery of the planet Neptune.

PERU, an important maritime republic of South America, bounded on the N. by Ecuador, on the W. by the Pacific, on the S. and S.E. by Bolivia, and on the E. by Brazil. It lies in lat. $3^{\circ} 25' - 21^{\circ} 30' S.$, and in long. $68^{\circ} - 81^{\circ} 20' W.$ The general outline resembles a triangle, the base of which is formed by the boundary-line between P. and Ecuador on the north. Its area is estimated at upwards of 500,000 square miles; and its population at 2,200,000. The area of P., however, can only be given approximately, as, on the east side of the Andes, and between the Amazon and the Purus, there is a wide and unexplored expanse of country, upon which both P. and Brazil have claims, which have not yet been determined. The country is 1100 miles in length, 780 miles in extreme breadth along the northern boundary, but is little more than 50 miles wide in the extreme south. Following the general direction, and not including windings, the coast-line is 1660 miles in length. The shores are in general rocky and steep; in the south, lofty cliffs rise from the sea, and, in some places, the water close in-shore has a depth of from 70 to 80 fathoms. Further north, however, sandy beaches occur, and in the extreme north, the shores are often low and sandy, and covered with brushwood. Owing to the comparative unfrequency of bays and inlets along the coast, the harbours are few and unimportant. Those of Callao (the port of Lima) and Payta afford the most secure anchorage, and the others are Trujillo, Cañete, Pisco, Camaná, Islay, Ilo, Arica, and Iniquique. Landing by boats is always dangerous, on account of the dreaded surf, occasioned by the swell of the Pacific, which perpetually beats upon the coast; and when goods or passengers require to be landed on unsheltered shores, recourse is had to the primitive *balsas*, or rafts, worked by the natives, and capable of carrying two or three persons.

Islands.—The islands on the Peruvian coast, although valuable, are extremely few in number, and small in extent. In the north, are the Lobos (i. e., *Sheep*) Islands, forming a group of three, and so called from the seals which frequent them. The largest of them, Lobos de Tierra, is 5 miles long by 2 miles broad, and the others, lying 30 miles south-west, are much smaller. On their eastern and more sheltered sides, they are covered with guano, and the quantity on the whole group is stated at 4,000,000 tons. The Chincha Islands, famous as the source from which Europe has been supplied with Peruvian guano (see GUANO) since 1841, also form a group of three, and are situated in the Bay of Pisco, about 12 miles from the mainland, and in lat. $13^{\circ} - 14^{\circ} S.$, long. $76^{\circ} - 77^{\circ} W.$ They lie in a line running north and south, and are called the North, Middle, and South Islands respectively. They closely resemble each other in size, formation, and general character. Each island presents, on the eastern side, a wall of precipitous rock, with rocky pinnacles in the centre, and with a general slope towards the western shore. The cavities and

inequalities of the surface are filled with guano, and this material covers the western slopes of the islands to within a few feet of the water's edge. There is no vegetation. The North Island has an area of 20½ acres. It is formed of feldspar and quartz, and is slowly but certainly decreasing in size. This island is wholly covered with thick layers of guano, which is quarried in some places to a depth of 80 feet. Two hundred convicts are employed here in cutting the guano and loading the vessels. The Middle Island, on which there are 140 acres occupied by guano, has been worked to some extent, and in this case the labourers are Chinese. It was estimated that in 1861, there were still lying on the islands about 9,538,735 tons of guano, which, at the present rate of consumption, will last until the year 1883. The island of San Lorenzo forms the harbour of Callao.

The grand physical feature of the country, and the source of all its mineral wealth, is the great mountain system of the Andes. A general description of the formation and character of the Peruvian Andes is given under the article ANDES (q. v.).

Surface, Soil, and Climate.—The surface of P. is divided into three distinct and well-defined tracts or belts, the climates of which are of every variety from torrid heat to arctic cold, and the productions of which range from the stunted herbage of the high mountain-slopes, to the oranges and citrons, the sugar-canes and cottons, of the luxuriant tropical valleys. These three regions are the *Coast*, the *Sierra*, and the *Montaña*.—The *Coast* is a narrow strip of sandy desert between the base of the Western Cordillera and the sea, and extending along the whole length of the country. This tract, varying in breadth from 30 to 60 miles, slopes to the shore with an uneven surface, marked by arid ridges from the Cordillera, and with a rapid descent. It is for the most part a barren waste of sand, traversed, however, by numerous valleys of astonishing fertility, most of which are watered by streams, that have their sources high on the slopes of the Cordillera. Many of the streams are dry during the greater part of the year. Between these valleys extend deserts, which are sometimes 90 miles in width. These are perfectly trackless, being covered with a fine, shifting, yellow sand, which is often carried about by the wind in pillars of from 80 to 100 feet in height. In the coast-region, properly so called, rain is unknown. This is caused by the coast of P. being within the region of perpetual south-east trade-winds. These winds, charged with vapours from the Atlantic, strike upon the east coast of South America, and traverse that continent obliquely, distributing rains over Brazil. But their vapour is thoroughly condensed by the lofty Cordilleras, and their last particles of moisture are exhausted in powdering the summits of these ranges with snow, after which they fall down upon the coast of P., cool and dry. The want of rain, however, is compensated for to some extent by abundant and refreshing dews, which fall during the night. The climate of the coast is modified by the cool winds. In the valleys, the heat, though considerable, is not oppressive. The highest temperature observed at Lima in summer is 85° , the lowest in winter is $61^{\circ} F.$

The *Sierra* embraces all the mountainous region between the western base of the maritime Cordillera and the eastern base of the Andes, or the Eastern Cordillera. These ranges are, in this country, about 100 miles apart on an average, and have been estimated to cover an area of 200,000 square miles. Transverse branches connect the one range with the other, and high plateaux, fertile plains, and deep tropical valleys lie between the lofty outer barriers.

PERU.

The superiority in elevation alternates between the two principal ranges. The east range, or, as it is generally called, the Andes, has the superiority in height in the southern half of this mountain system. It abuts upon the plain, from the Bolivian frontier, in a majestic mass, surmounted by stupendous pinnacles, rugged in outline, and most frequently rising in splintered needle-like peaks, covered with snow. North of lat. 13° S., however, the Western Cordillera assumes the grander character, and preserves it until it crosses the northern frontier. The scenery of the Western Cordillera is broader and more massive in character, and its summits less pointed than those of the Andes. Rugged paths, sometimes so narrow as barely to afford footing to the mules which are invariably used in such ascents, lead up its steep sides. Occasionally, from these narrow passes, gaping and apparently bottomless precipices slide perpendicularly downward from the very feet of the traveller, and the prospect is rendered still more hideous by the distant roar of a torrent, hidden by mists, at the bottom of the ravine. Occasionally, also, the mountain route leads over abysses 500 feet in depth, across which, by way of bridge, a few poles are thrown, which roll about in an uncomfortable manner under the feet. In traversing these dangerous passes, which line the huge rocks like aerial threads, the traveller often comes upon scenery of the most picturesque and beautiful description. The clefts and sides of the hills, even at altitudes which might be called alpine, are clothed with wild-flowers, many of which, now long cultivated in Britain, have become highly prized among us as garden-plants. Verbenas, lupines, blue and scarlet salvias, fuchsias, calceolarias, and the fragrant heliotrope, add a sense of beauty to the sense of power which the stupendous scenery imparts. The following are the most striking and distinctive physical features of the Sierra, beginning from the south: 1. The plain of Titicaca, partly in P., and partly in Bolivia, is enclosed between the two main ridges of the Andes, and is said to have an area of 30,000 miles—greater than that of Ireland. In its centre is the great Lake Titicaca, 12,846 feet above sea-level, or 1600 feet above the loftiest mountain pass (the Col of Mont Cervin) of Europe. The lake is 115 miles long, from 30 to 60 miles broad, from 70 to 180 feet deep, and 400 miles in circumference. Its shape is irregular; it contains many islands, and several peninsulas abut upon its waters. 2. The Knot of Cuzco. The mountain-chains which girdle the plain of Titicaca trend toward the north-west, and form what is called the Knot of Cuzco. The Knot comprises six minor mountain-chains, and has an area thrice larger than that of Switzerland. Here the valleys enjoy an Indian climate, and are rich in tropical productions; to the north and east of the Knot extend luxuriant tropical forests, while the numberless mountain-slopes are covered with waving crops of wheat, barley, and other cereals, and with potatoes; and higher up, extend pasture-lands, where the vicuña and alpaca feed. 3. The valley of the Apurimac, 30 miles in average breadth, and extending north-west for about 300 miles. This valley is the most populous region of Peru. 4. The Knot of Pasco. From Cuzco proceed two chains toward the north-west; they unite again in the Knot of Pasco. This Knot contains the table-land of Bombon, 12,300 feet above sea-level; as well as other table-lands at a height of 14,000 feet, the highest in the Andes; otherwise, however, the physical features of the country resemble those of the vicinity of Cuzco. 5. The vale of the river Marañon. This valley, which is upwards of 300 miles in length, is narrow, deep, and nearer the equator than any

other valley of the Sierra, and consequently, it is the hottest portion of this region; and its vegetation is thoroughly tropical in character. The conformation of the surface of the Sierra is of the most wonderful description. After the table-lands of Tibet, those of the Peruvian Andes are the highest in the world; but, unlike those of Tibet, which are mere grassy uplands, the table-lands of P. are the seat of a comparatively high civilisation, and are studded over with towns and villages, perched on heights exceeding in elevation the summits of the Jungfrau and the Wetterhorn. Nor are such towns the mere eyries of miners who are tempted to ascend thus high in search of the precious metals; for, even at this elevation, the climate is pleasant, and wheat, maize, barley, rye, and potatoes thrive well. The city of Cuzco, situated in a region of rare beauty, and enjoying a temperate climate, is 11,380 feet above sea-level, or 2000 feet higher than the Great St Bernard. The climate of the Sierra, however, is not always so charming. In general terms, it may be described as mild and variable, with moderate rains. In the district of Paucartambo, rain falls 300 days in the year. A country, however, of such an uneven surface, of snow-covered peaks and tropical valleys, embraces every variety of climate. In all the lower regions of the country the climate is warm, but healthy; in the uplands, and on the highest plateaux, it is often inclement. Violent storms beat upon the plain of Titicaca; and terrific tempests, accompanied with thunder and lightning, roll frequently around the table-lands of Pasco (q. v.); where, indeed, the climate is so cold, that but for the mines, which have attracted hither a numerous population, this region might have remained uninhabited. At the height of 9000 feet above sea-level, the mean temperature is 60° Fahr., and the variation throughout the year is not great. The highest peaks of the country reach to upwards of 22,000 feet, and many peaks in both ranges are from 17,000 to 20,000 feet high. In the Western Cordillera, and in the south of the country, are four volcanoes—Candarave, Ubinas, Omate, and Arequipa. The soil of the Sierra is of great variety; but wherever it is cultivated, it is productive.

The *Montaña*, forming two-thirds of the entire area of the country, stretches away for hundreds of leagues eastward from the Andes to the confines of Brazil. On the N., it is bounded by the Amazon, on the S. by Bolivia. It consists of vast impenetrable forests and alluvial plains, is rich in all the productions of tropical latitudes, is of inexhaustible fertility, and teems with animal and vegetable life. It is still, however, almost wholly unproductive to man. The silence of its central forests has never been disturbed by the civilised explorer, and its only human inhabitants are a few scattered tribes of Indians. The *Montaña* is watered by numberless streams, and by a large number of important rivers. It belongs wholly to the basin of the Amazon. Along the head-waters of the Purus, which, flowing through beautiful forest-covered plains, approaches to within 60 miles of Cuzco, there were at one time numerous Spanish farms, where great tracts of forests had been cleared, and where crops of cocoa, cocoa, sugar, and other tropical productions, were regularly raised. These farms have since 1861 been abandoned, and the encroaching forest has already obliterated their sites. The upper waters of the Purus are the headquarters of a savage and barbarously cruel tribe of wild Indians called Chunchos. These untamable savages have shown the greatest hostility to the advance of civilisation. They murdered the settlers, or drove them to take refuge in some less advanced settlement. When Mr Markham visited this region in 1873, a few farms

well cultivated; from a paper, however, which he examined, due to the *Journal of the Royal Geographical Society*, and which is dated 1841, it would appear that the Chinese have worked their barbarous work, for the natives have either all been massacred or driven back from the forest, so that now not a single settlement remains. The rich valleys of Pansamung were covered with flourishing Spanish farms, but have now become one vast tropical forest. The virgin soil of the mountains is of amazing fertility, while the climate, though not oppressively hot or healthy. The forests consist of large trees, of which some are remarkable for the beauty of their wood, others for their valuable gums and resins, and others as timber trees. A rank undergrowth of vegetation covers the country, and the trees are often climbed for fuel and fashioned with weapons and daily-used purposes. In this sense, for the most part uninhabited by the race of man, devoid of even a animal life, the Chinese produce variety, and birds of the brightest plumage fill among the foliage. Among the products which are yielded here in spontaneous abundance, are the fashionable Peruvian bark (see Chinensis), India rubber, gum copal, vanilla (Indie capsula), lacquer, muscaine, castoreum, pomegranate, vegetable wax, &c. On the western fringe of the mountains, where there are still a few settlements, missions, sugar, coffee, cotton, and churches, are cultivated with successful success.

Hydrography.—The hydrography of P. may be and is divided into three systems—those of Lake Titicaca, the Amazon, and the Amazon. The streams that flow into Lake Titicaca are few and unimportant. The rivers, about, having their sources in the Western Cordillera, flow west into the Pacific, are about 100 in number, but many of them are dry in summer, and even the more important are rapid and shallow, have a short course, and are navigable even for canoes, and are mainly used in the purpose of irrigation. All the great rivers of Peru are tributaries of the Amazon. The Amazon, rising between the Eastern and Western Cordilleras, and flowing tortuously to the north-west coast, is generally considered to be the head-water of the Amazon (p. 6). The Huallaga river and the Ucayali of Romanin, flow northward to the Amazon. It is navigable for 600 miles the most of the navigation (the longest being at Iquitos 2000 miles) lies miles of its course. The Yungay-Chiriqui, an important river, enters the Amazon 200 miles below the Huallaga. Its tributaries and affluents, among which are the Tapanoti and the Apurimac, drain the greater portion of the Peruvian sierra. The Purus, which reaches to the valleys of Huancabamba, within 60 miles of there, has not yet been explored. We know almost of its source, and that it enters the Amazon by four mouths, a little above Iquitos. It flows through what is perhaps the richest and most beautiful region of Peru. Many attempts have been made to explore this great basin of which, however, down to 1862, appear to have had with very success. The facilities which it would afford for the transport of most valuable products, have long been acknowledged by the Peruvian government. One of the chief head-waters of the Purus is the Madre de Dios. In 1861–1862, an expedition, consisting of a company of young men, the *Comité de Ciencias*, was organized, with the view of ascending to the Madre de Dios, and establishing a station of exploration thence by the Purus to the Amazon. Should they meet with success in their enterprise as regards the great fluvial highways of the river, most important agricultural and commercial results may be derived.

Convolvulus, Nicotiana and Ipomoea, Hemman, etc.—

The wealth and resources of P. consist not in manna forests, but entirely in mineral, vegetable, and animal products. As no statistics are taken in the country it is impossible to give the quantity and value of the productions, and of the exports and imports, even approximately. Of the precious metals, the production has greatly fallen off since P. became an independent state; and this country, which once stood in the same relation to Spain as Australia does to Great Britain, now contributes little to the metallic wealth of the world. The numerous stores of gold and silver found here by the Spanish invaders represented the accumulation of centuries, and that among a people who used the precious metals only for the purposes of ornamentation. Nevertheless, P. possesses vast metallic riches. The Andes abound in mines of gold, silver, copper, lead, iron, &c. and in the Mountains, gold is said to exist in abundance in veins and in pools on the margins of rivers. The exports of metals, of which a portion consisted in coined money and plate, amounted in 1859, according to Mr. Markham, to only £289,999. This comparatively insignificant amount of produce in a country so rich in the precious metals, is to be ascribed for chiefly to the association and important causes in which the mining operations are carried on. A grievance, from which this republic suffers much, is the want of good economy. It can hardly be said that Peruvian economy exists, inasmuch as there is speculation in the mine of Bolivia. The British colony consist of the Province of Ilaya, existing in 1802 area, however, that a new Peruvian colony is in contemplation, and will so could be promptly organized. 1861 besides the precious metals, P. possesses other most important natural resources. In addition to the guano to which allusion has already been made, another important article of national wealth is nitrate of soda, which is found in enormous quantities in the province of Tarapaca. This substance, which is a powerful fertilizer (see Nitrate), is calculated to cover in this province alone, an area of 50 square leagues, and the quantity has been estimated at 65,000,000 tons. In 1859 (from the port of Iquique alone), 1,570,248 cwt. were exported. Here also great quantities of turps are found. The working of this valuable substance, however, is interdicted by government, which has made a monopoly of it, as it line of the guano; but such small parcels of it as have been exported bring about £30 per ton in the English market.

The vegetable productions of P. are of every variety, embracing all the products both of temperate and tropical climates. The European cereals and vegetables are grown with perfect success, together with maize, rice, pumpkins, melons, coffee, sugar-cane, cotton, &c. Fruits of the most delicious flavour are grown in endless variety. Cotton, for which the soil and climate of P. are admirably adapted, is now produced here in gradually increasing quantity. The land suited to the cultivation of this plant is of immense extent, and the quality of the cotton grown is excellent. The animals comprise those of Europe, together with the Lama (p. v.) and its allied species. In 1859, 2,501,531 lbs. of fura and alpaca wool were imported into Great Britain. Although P. produces so much excellent wool, almost the whole of the woollen fabrics used as clothing by the Indians are manufactured in Yorkshire, England.

Ancient Civilization and History—P., the origin of whose name is unknown, is now passing through its third historical era, and is manifesting its third phase of civilization. The present era may be said to date from the coming of the country

by the Spaniards in the early part of the 16th c.; the middle era embraces the rule of the Incas; and the earliest era, about which exceedingly little is known, is that Pre-Incarial period, of unknown duration, during which a nation or nations living in large cities flourished in the country, and had a civilisation, a language, and a religion different, and perhaps in some cases even more advanced than those of the Incas who succeeded them, and overran their territories. Whence these Pre-Incarial nations came, and to what branch of the human family they belonged, still remain unanswered questions. Their existence, however, is clearly attested by the architectural remains, sculptures, carvings, &c., which they have left behind them. Ruins of edifices constructed both before the advent of the Incas, and contemporary with, and independently of, them, are found everywhere throughout the country. On the shores of Lake Titicaca, for example, are the ruins of Tia-Huanacu, consisting of sculptured monolithic doorways, one of which is 10 feet high, and 13 feet wide; of pillars, 21 feet high, placed in lines at regular distances; and of immense masses of hewn stone, some 38 feet long by 18 broad. In 1846, several colossal idols were excavated, some being 30 feet long, 18 wide, and 6 thick. The idols are in the form of statues, and the ears are not enlarged by the insertion in the lobes of silver rings, as those of sculptured figures, executed in Incarial times invariably are. The ancient fragments of buildings on these shores were beheld with astonishment by the earliest of the Incas, who, by their own confession, accepted them as models for their own architecture. The name Tia-Huanacu is comparatively modern, having been conferred by one of the Incas; neither history nor tradition has handed down the original name. The ruins stand at a height of 12,930 feet above sea-level, and one of the many mysteries which have crowded around this ancient site is, that this spot, in the midst of what is now generally a frozen desert, and where the rarity of the air must be so great as to be hurtful, should have been chosen as the seat, as it is generally believed to have been, of an ancient government. Of the character and degree of the civilisation of the Pre-Incarial races, almost nothing is known. It is worthy of note, however, that at Pachacamac, 25 miles south of Lima, where there are the remains of a now wholly deserted city, and of a great temple, the religion seems to have been a pure Theism; for when the Peruvians of Cuzco carried their victorious arms across the Cordilleras to this district, they beheld this temple (the doors of which are said to have been of gold inlaid with precious stones) with astonishment, not only because it rivalled if not surpassed in splendour the famous Temple of the Sun at Cuzco, but because it contained no image or visible symbol of a god. It was raised in honour of an invisible and mysterious deity, whom the inhabitants called Pachacamac, the Creator of the World (from two words of the ancient Peruvian language, *Pacha*, the earth; and *Camac*, participle of the verb *Camani*, to create). The Peruvians did not dare to destroy this temple, but contented themselves with building by its side a Temple of the Sun, to the worship of which they gradually won over the inhabitants.—For further information regarding Pre-Incarial times and races, see W. Bollaert's *Antiquities, Ethnology, &c. of South America* (Lond. 1860).

Regarding the origin of the Incas, nothing definite can be said. We have no authorities on the subject save the traditions of the Indians, and these, besides being outrageously fabulous in character, are also conflicting. It appears, however, from all the traditions, that Manco, the first Inca, first appeared

on the shores of Lake Titicaca, with his wife Mama Oello. He announced that he and his wife were children of the Sun, and were sent by the glorious Inti (the Sun) to instruct the simple tribes. He is said to have carried with him a golden wedge, or, as it is sometimes called, a wand. Wherever this wedge, on being struck upon the ground, should sink into the earth, and disappear for ever, there it was decreed Manco should build his capital. Marching northward, he came to the plain of Cuzco, where the wedge disappeared. Here he founded the city of Cuzco, became the first Inca (a name said to be derived from the Peruvian word for the Sun), and founded the Peruvian race, properly so called. Manco, or Manco Capac (i.e., Manco the Ruler), instructed the men in agriculture and the arts, gave them a comparatively pure religion, and a social and national organisation; while his wife, Mama Oello, who is also represented as being his sister, taught the women to sew, to spin, and to weave. Thus, the Inca was not only ruler of his people, but also the father and the high-priest. The territory held by Manco Capac was small, extending about 90 miles from east to west, and about 80 miles from north to south. After introducing laws among his people, and bringing them into regularly organised communities, 'he ascended to his father, the Sun.' The year generally assigned as that of his death, after a reign of forty years, is 1062 A.D. The progress of the Peruvians was at first so slow as to be almost imperceptible. Gradually, however, by their wise and temperate policy, they won over the neighbouring tribes, who readily appreciated the benefits of a powerful and fostering government. Little is clearly ascertained regarding the early history of the Peruvian kingdom, and the lists given of its early sovereigns are by no means to be trusted. They invented no alphabet, and therefore could keep no written record of their affairs, so that almost all we can know of their early history is derived from the traditions of the people, collected by the early Spaniards. Memoranda were indeed kept by the Peruvians, and, it is said, even full historical records, by means of the *quipu*, a twisted woollen cord, upon which other smaller cords of different colours were tied. Of these cross threads, the colour, the length, the number of knots upon them, and the distance of one from another, all had their significance; but after the invasion of the Spaniards, when the whole Peruvian system of government and civilisation underwent dislocation, the art of reading the quipu, seems either to have been lost, or was effectually concealed. Thus it is that we have no exact knowledge of Peruvian history further back than about one century before the coming of the Spaniards. In 1453, Tupac Inca Yupanqui, the eleventh Inca, according to the list given by Garcilasso de la Vega, greatly enlarged his already wide-spread dominions. He led his armies southward, crossed into Chili, marched over the terrible desert of Atacama, and penetrating as far south as the river Maule (lat. 36° S.), fixed there the southern boundary of Peru. Returning, he crossed the Chilean Andes by a pass of unequalled danger and difficulty, and at length regained his capital, which he entered in triumph. While thus engaged, his son, the young Huayna Capac, heir to the fame as well as the throne of his father, had marched northward to the Amazon, crossed that barrier, and conquered the kingdom of Quita. In 1475, Huayna Capac ascended the throne, and under him the empire of the Incas attained to its greatest extent, and the height of its glory. His sway extended from the equatorial valleys of the Amazon to the temperate plains of Chili, and from the

early phase of the Pacific to the marvellous sources of the Amazon. Of this immense territory, known as the *puna*, implies the good straight road, was the great mother, from which branched off from it to the north, south, east, and west, and ramified through every part of the kingdom. The greatest feature of the country was that which led from Lima through Cuzco into the Indian dominions. In the construction, gullies were cut for leagues through the living rock; rivers were crossed by bridges of chained stones that swung in the air; mountains were ascended by staircases artificially cut and valleys were filled up with solid masonry. It was from Lima to Cuzco, nine days' journey, and about 600 miles long, and was built of heavy logs of freestone. From all the great routes were roads or small paths about five miles apart, attached to which were a number of *ramas*, whose business it was to carry forward the dispatches of government. In many of these mountainous, fresh fish caught in one day at Lima, on the Pacific is said to have been eaten the next day at Cuzco. The distance between these places is 400 miles, and the road traversed the wildest and most mountainous country in the world. Order and civilization accompanied conquest among the Peruvians, and each tribe that was conquered found itself under a careful paternal government, which provided for it, and benefited it in every way.

The government of P. was a pure but a mild despotism. The king, as the representation of the sun, was the lord of the spiritual, and presided at the great religious festivals. He imposed taxes, made laws, and was the source of all dignity and order. He wore a purple head-dress, of which the finished fringe, with two feathers placed upright in it, were the proper insignia of royalty. On the nobility, all those descended by the male line from the founder of the monarchy, shined in contrast with the seditious masses, the sacred class of Incas. They wore a peculiar dress, enjoyed special privileges, and lived in ease; but none of them could take the pleasure of the Incas except with their task, and bearing a burden on the shoulders, as taken of all-games and amusements. They formed, however, the real strength of the empire, and being superior to the other races in intellectual power, they were the fountain whence flowed that confidence and moral organization which gave P. a position above every other state of South America. Prior to the arrival of the Spaniards, P. contained a population of 8,000,000—twelve times greater than it is at the present day. The empire was divided into four parts, into each of which one of the great roads branched from Cuzco. Each of the four provinces was administered by a vicar or governor. The nation was further subdivided into departments of 10,000 inhabitants, each also administered by a governor; and there were other subdivisions into persons, numbers, the lowest of which was ten, and some one of which was ruled by head-men, who were responsible for offences, and were required to see that those under them enjoyed the rights to which they were entitled. The governors and chief officers were selected from the Incas' aristocracy. The king ruled almost wholly in criminal matters, and was lenient, and remarkably severe. Theft, adultery, murder, blasphemy against the Sun, and burning of Indians were all capital crimes. The territory of Peru was divided into three portions, and from these portions were derived the revenue that supported the Incas, the Incas, and the people respectively. The numerous aristocracy, and the costly ceremonial of the national worship, were supported by the Incas, the royal household and the government expenditure were defrayed out of the annual, and

the people, at so much per head, divided the third of these portions. There was a law division of the soil every year, and the extent of land apportioned to each household was regulated by the numbers in his family. It might be supposed that this arrangement would be fatal to improvement of the soil, and to the pride in, and love of, home; but this was not the case; and it is probable that at each portion of the soil, the tenant was, as a rule, confirmed in his occupation. The three divisions were cultivated by the people, the territory apportioned to the Incas being attended to first, that belonging to the people themselves next, and lastly, the divisions belonging to the Incas. The labour on the Incas' share of the land was engaged in by the whole population at the same time, and the work was lightened by the national songs and ballads, and the state made picturesque by the holiday attire of the workers. The mountains of the country were managed in the same way, the people labouring first in making clothes for themselves, and afterwards giving their work to the Incas. The mines were worked by the people, but no one gave more than a certain amount of them to the government service (during which time he was maintained at the government expense), and after discharging the stipulated amount of duty, he was succeeded by another. Mining was unknown among the Peruvians. There were a nation of workers, but they wrought on the members of one family, labour being entered on all for the benefit of all.

The national policy of the Peruvians had its imperfections and drawbacks, and though capable of unlimited extension, it was not capable of advancement. It was in the last degree conservative, and was of such a nature that the introduction of reform in any vital particular must have overturned the whole constitution. Nevertheless, the wants of the people were few, and these were satisfied. Their labour was not more than they could easily perform, and it was pleasantly diversified with frequent holidays and festivals. They lived contentedly and securely under a government strong enough to control them, and a sufficiency of the necessities of life was obtained by every individual. Still, in the valleys of the Cordillera and on the plain of Cuzco, may be found numbers of people in which the Peruvian means the happy days of peace, security, and comfort enjoyed by his ancestors. Further, they revered and loved their monarch, and considered it a pleasure to serve him. With subjects of such a temper and disposition, the Incas might direct the entire energies of the nation as they chose; and it is true that they were able to construct those gigantic public works which would have been wonderful even had they been performed with the assistance of European machinery and appliances.

The Peruvian system of agriculture was brought to its highest perfection only by the prodigious labour of several centuries. Not only was the fertile soil cultivated with the utmost care, but the sandy wastes of the coast, unvisited by any rains, and but scantily watered by brooks, were rendered productive by means of an artificial system of irrigation, the most stupendous, perhaps, that the world has ever seen. Water was collected in lakes among the mountains, led down the slopes and through the sands of the coast, apparently doomed to sterility, by canals and subterranean passages constructed on a vast scale, and the rules of which, to be seen at the present day, attest the industry, ingenuity, and admirable patience of the Peruvians. The aqueducts, which were sometimes between 100 and 500 miles in length, were in some cases

PERU.

tunnelled through massive rocks, and carried across rivers and marshes. They were constructed of large slabs of freestone, fitting so closely as to require no cement, and answering perfectly the purpose for which they were intended, for the sandy wastes were converted into productive fields and rich pasture-lands, and the coast teemed with industrious inhabitants. In the valley of Santa, there were once 700,000 inhabitants; there are now only 12,000; in that of Ancullama, there were 30,000 individuals; there are now only 425. The fields on the coast were also enriched with the manure of sea-fowls, which has since come to be known as guano. Fragments of the aqueducts still remain, and are surveyed with astonishment by the traveller, who wonders that such works could have been constructed by a people who appear to have employed no machinery, had no beasts of burden, who did not know the secret of the true arch, and who did not use tools or instruments of iron. But the triumphs of industry were not more decided on the coast than they were in the *Sierra*. Here, at elevations visited now only by the eagle and the condor, the rocky heights, riven by innumerable chasms and deeply-cut precipices, were crowned with waving crops of wheat and maize. Where the mountain-slopes were too steep to admit of cultivation, terraces were cut, soil was accumulated on them, and the level surfaces converted into a species of hanging-gardens. Large flocks of lamias were grazed on the plateaux; while the more hardy vicuñas and alpacas roamed the upper heights in freedom, to be driven together, however, at stated periods, to be shorn or killed. The wool yielded by these animals, and the cotton grown in the plains and valleys, were woven into fabrics equally remarkable for fineness of texture and brilliancy of colour.

The character of the architecture of the Peruvians has already been alluded to. The edifices of Incarial times are oblong in shape and cyclopean in construction. The materials used were granite, porphyry, and other varieties of stone; but in the more rainless regions, sun-dried bricks were also much used. The walls were most frequently built of stones of irregular size, but cut with such accuracy, and fitting into each other so closely at the sides, that neither knife nor needle can be inserted in the seams. Though the buildings were not, as a rule, more than from 12 to 14 feet high, they were characterised by simplicity, symmetry, and solidity. The Peruvian architects did not indulge much in external decoration; but the interior of all the great edifices was extremely rich in ornament. In the royal palaces and temples, the most ordinary utensils were of silver and gold; the walls were thickly studded with plates and bosses of the same metals; and exquisite imitations of human and other figures, and also of plants, fashioned with perfect accuracy in gold and silver, were always seen in the houses of the great. Hidden among the metallic foliage, or creeping among the roots, were many brilliantly-coloured birds, serpents, lizards, &c., made chiefly of precious stones; while in the gardens, interspersed among the natural plants and flowers, were imitations of them, in gold and silver, of such truth and beauty as to rival nature. The Temple of the Sun at Cuzco, called *Corsuncu*, or 'Place of Gold,' was the most magnificent edifice in the empire. On the western wall and opposite the eastern portal, was a splendid representation of the Sun, the god of the nation. It consisted of a human face in gold, with innumerable golden rays emanating from it in every direction; and when the early beams of the morning sun fell upon this brilliant golden disc, they were reflected from it as from a mirror, and again reflected thereabout the whole temple by the numberless

plates, cornices, bands, and images of gold, so that the temple seemed to glow with a sunshine more intense than that of nature.

The religion of the Peruvians, in the later ages of the empire, was far in advance of that of the barbarous nations. They believed in a Great Spirit, the Creator of the universe, who, being a spirit, could not be represented by any image or statue, nor be made to dwell in a temple made with hands. They also believed in the existence of the soul hereafter, and in the resurrection of the body after-life, they considered to be a condition of peace and tranquillity for the good, and of everlasting wearisome labour, extending over ages, for the wicked. But while they believed in the justice of the world, they also believed in other powers, who were of some subordinate rank to the Great Spirit. Of these secondary gods, the Sun was chief. They revered the Sun as the ancestor of their royal dynasty; and everywhere throughout the land, altars smoked with offerings burned in his worship.

About the year 1516, and ten years before the death of Huayna Capac, the first white man landed on the western shores of South America. It was not till the year 1532, that Pizarro, at the head of a small band of Spanish adventurers, actually invaded Peru. On his death-bed, the Inca expressed a wish that the kingdom should pass to Atahualpa, one of his sons, a prince of Quito whom he had received and concubines, and that all his other territories should fall to his son Huascar, the heir to the crown, who, according to the custom of the Incas, had inherited all its dependencies. Between these two princes, quarrels, resulting in war, arose when Pizarro entered P., he found the country occupied by two rival factions, a circumstance which he took full advantage of. Atahualpa completely defeated the forces of his brother, taken Huascar prisoner, and was now seated at Caxamalca, on the eastern side of the Andes, with a force of 177 men, of whom 57 were cavalry, the dauntless Spanish leader, in 1532, set out to meet him. For the capture of Atahualpa by the Spaniards, his subsequent violent death, see article ATAHUALPA. The execution of the Inca at Caxamalca, the Spaniards set out for Cuzco. Their strength had been recently increased by reinforcements, and now numbered nearly 500 men, of whom 100 were a third were cavalry. They entered the capital, 15th November 1533, having in the course of their progress toward the city of the Incas many sharp and sometimes serious encounters with the Indians, in all of which, however, the Spaniards, and artillery, and cavalry gave them the worst. At Cuzco they obtained a vast amount of treasure, the one object for which the conquest was undertaken. As at Caxamalca, the art treasures were for the most part melted down, and divided among the band. Their soldiers, however, did many of them little good, as they afforded them the means of gambling, and many of them, rich at night, found themselves penniless adventurers in the morning. Having obtained the splendid golden image of the Sun as his share of the booty, but not being able to carry it in a single night. After stripping the temples of their treasures, Pizarro placed a son of the great Huayna Capac, one of the Incas. Leaving a garrison in the capital, he then marched west to the sea-coast, with the intention of building a town, from which he might more easily repel invasion from within, which should be the future capital of the empire.

Choosing the banks of the river Rimac he founded, about six miles from its mouth, the *Castillo de los Reyes*, 'City of the Kings'. Subsequently, its name was changed into Lima, the modified form of the name of the river in which it was placed. But the progress of a higher civilisation than began, was interrupted by an event which overturned the plans of the general, and entailed the severest calamities on many of his followers. The Inca Manco, terrified on every hand, and in the most embarrassing manner, by the proud Castilian soldiers, effected his escape, and headed a formidable army of the natives. Gathering round Cuzco in numerous numbers, the natives laid siege to the city, and set it on fire. An Indian force also invaded Xauxa, and another detachment threatened Lima. The siege of Xauxa was maintained for five months, after which time the Peruvians were commanded by their king to retire to their farms, and withdraw the aid that the country might be saved from famine. The advantages, many, though unimportant, which the Inca gained in the course of this siege, were his last triumphs. He afterwards retired to the mountains, where he was murdered by a party of Spaniards. More formidable, however, to Pizarro than any rising of the natives, was the quarrel between himself and Almagro, a person of common disposition, but of fiery temper, who, after Almagro, held the highest rank among the conquerors. For the inscription, trial, and execution of this chief, see article ALMAGRO. The ambition of the country was now in every sense awakened. The natives, astonished and awe by the appearance of cavalry than by the flesh, the sword, and the deadly execution of artillery, had accustomed to names which they had no means of immediately understanding. Meanwhile, the Almagros had not yet died out with the death of its leader, and they still awaited aid from the Spaniards. The Spaniards, it was resolved to assassinate the General as he returned from mass on Sunday, 26th June 1537. Hearing of the conspiracy, but attaching little importance to the information, Pizarro nevertheless deemed it prudent not to go to mass that day. His house was assaulted by the conspirators, who, murdering his servants, broke in upon his great leader, overwhelmed him by numbers, and killed him (see PIZARRO). The son of Almagro then proclaimed himself governor, but was soon killed in battle, and put to death. In 1542, Vernal was killed at Yallakold, at the instigation of the rebellious Las Casas, who felt shocked and humiliated at the excesses committed on the natives. The result of this murder was, that a code of laws was formed for P., according to one clause of which, the Indians who had been enslaved by the Spaniards were legally restored free men. It was also enacted that the Indians were not to be forced to labour in unhealthy localities, and that in whatever cases they were desired to work in any particular locality, they were to be fairly paid. These and similar clauses enraged the adventurers. Blasco Benes Vela, sent from Spain to enforce the new laws, rendered himself unpopular, and was seized, and thrown into prison. He had come from Spain accompanied by an 'admiral' of two, who now undertook the government. Gonzalo Pizarro (the last in this country of the family of that name), who had been elected captain-general of P., now marched threateningly upon Lima. He was too powerful to withstand, and the audience rendered him in a friendly manner, and after the administration of justice, elected him president as well as captain-general of the country. The success of this adventure was cut short by Velazquez de Huesca, who, invested with the powers

of the sovereign, arrived from Spain, collected a large army, and pursued Pizarro, who was eventually taken and executed.

A series of petty quarrels, and the thousand story of the sedition of one ruling family for another, make up a great part of the subsequent history. The country became one of the four viceroyalties of Spanish America, and the Spanish authority was fully established and administered by successive viceroys. The province of Quito was separated from P. in 1719; and in 1764, considerable territories in the north were detached, and formed into the government of Buenos Ayres. At the outbreak of the War of Independence in South America, the Spanish government, finding having much declined in internal strength, was disgusted with the dissensions of a regency, and tore by civil war; nevertheless, in 1820, the Spanish viceroy had an army of 25,000 men in Peru, and all the loose towns were completely in the hands of Spanish officials. P. was the last of the Spanish South American possessions to set up the standard of independence. In August 1820, a rebel army, under General San Martín, one of the liberators of Chili, sailed for P., and after a number of successes both on sea and land, in which the patriots were most effectively assisted by English volunteers, the independence of the country was proclaimed 28th July 1821, and San Martín assumed the presidency of the young republic. From this date to the year 1849, 21 rulers, under various titles, have held sway. For the history of these years of its existence as an independent republic, the country was distracted and devastated by wars and revolutions. In 1845, Don Marcos Castilla was elected president; and under his firm and sagacious guidance, the country enjoyed an unbroken measure of peace and became regularly organized. Commerce began to be developed, and important public works were undertaken. The term of his presidency ended in 1851, in which year General Rafael José Salazar was elected president. The country, however, was dissatisfied with his government, and Castilla, after raising an insurrection in the north, again found himself in 1853 at the head of affairs. Slavery, which, although abolished by the charter of independence, still existed, was put an end to by a decree dated October 1854. In August 1855 a quarrel had taken place at the estate of Talcahu, in the north, between some Spanish emigrants and the natives, in which several of the disputants were killed or wounded. Taking advantage of this occurrence, the Spanish government sent out a 'special commissioner' in the spring of 1856, who delivered a memorandum to the Peruvian minister, complaining of injuries sustained by the Spaniards, and accompanied by a letter threatening prompt and energetic reprisals, should again be insulted or her flag disgraced. The 'commissioner' left Lima on the 12th April, the day on which his memorandum and letter were delivered; and on the 14th, a Spanish squadron, under Admiral Piñero, who had been joined by the 'commissioner', took forcible possession of the Chincha Islands, the principal source of the revenue of Peru. The quarrel has not yet (August 1858) come to a termination.

The government of P. is republican; but hitherto it has borne for the most part the character of a military despotism. Its president is elected for a term of six years. He is assisted by a Senate, consisting of two members from each province, and a House of Representatives, of whom there is one member for every 20,000 inhabitants. In 1853, General Pezet succeeded to the presidency. The ministers, together with senators chosen by the congress, form the cabinet. In 1850 the Senate consisted of 26 members, and the House of 80

PERUGIA—PERUVIAN BARK.

members. The receipts in 1861 amounted to 21,245,832 dollars, of which 16,921,751 dollars were derived from the sale of guano; the expenditure for the same year amounted to 21,446,466 dollars. The public debt in 1862 amounted to 23,458,761 dollars. The army in the same year consisted of 16,000 men, and the navy of 17 vessels, carrying 84 guns. The country is divided into 11 departments, and two provinces with the constitution of departments; and the departments are subdivided into provinces, the provinces into districts, and the districts into parishes. Of the whole pop., 240,000 are whites, 300,000 Mestizos and dark, 40,000 Negroes, and 1,620,000 Indians.

PERUGIA, a city of Central Italy, capital of the province of the same name, stands on a lofty elevation, 800 feet high, on the right bank of the Tiber, ten miles east of the lake of the same name (ancient *Lacus Trasimenus*), and 84 miles north of Rome. It is surrounded with walls pierced with numerous gates, of which the *Arch of Augustus* (so called from the inscription *Augusta Perusia* over it, inscribed by Augustus) is the finest. It is the see of a bishop, and contains upwards of 100 churches, and about 50 monastic establishments. Its streets are wide, and there are several squares lined with massive buildings. The broad Corso, which contains the finest edifices, unites two squares, one of which is occupied by the *Duomo*, or cathedral, dedicated to San Lorenzo, and dating from the end of the 15th century. It is in a fine bold Gothic style, and contains many excellent paintings, carvings, &c. Many of the churches and convents are noble Gothic structures, and all of them are more or less famous for their pictures, some of which are by Raphael, Perugino, and other great masters. In the vicinity of the city, a number of tombs, supposed to mark the site of the necropolis of ancient P., were discovered in 1840. The tombs contain numerous beautiful cinerary urns, in marble and travertine; and lamps, vases, bronze armour, ornaments, pateræ, &c., were also found, but have for the most part been removed to a neighbouring villa. The university of P., founded in 1320, and liberally endowed, contains a botanic garden, a cabinet of mineralogy, a museum of antiquities, and a library of 30,000 vols., with some valuable manuscripts. It is attended by from 300 to 400 students. Besides the picture-gallery of the Academy of Fine Arts, there are numerous private art-collections. P. contains also many interesting palaces, a beautiful fountain, an exchange, theatres, &c. Velvets, silk-stuffs, woollen goods, soap, brandy, and liqueurs are manufactured; and a considerable trade is carried on in corn, oil, wool, wine, and cattle. Pop. (1862), inclusive of suburbs, 44,130.

P., the ancient *Perusia*, was one of the twelve Etrurian republics. It became tributary to Rome 294 B.C. During the war between Mark Antony and Augustus, it was taken by the latter, and was burned down. It was captured by the Goths under Totila at the fall of the Western Empire. Under Pope Paul III., it was united to the Papal States. In 1860, it became a part of the Kingdom of Italy under Victor Emmanuel.

PERUGIA, LAKE OF. See *TRASIMENUS LACUS*.

PERUGINO, a celebrated Italian painter, whose real name was **PIETRO VANNUCCI**, was born at Citta della Pieve in Umbria, about 1446, but having afterwards established himself in the neighbouring and more important city of Perugia, where he had the right of citizenship, he is commonly called *Il Perugino*. It is generally thought that he studied under Andrea Verocchio at Florence. He executed numerous excellent works in various cities, particularly in

Florence, Siena, Pavia, Naples, Bologna, Rome, and Perugia. Sixtus IV. employed him in the Cappella Sistina; and his fresco of 'Christ giving the Keys to Peter' is by far the best of those painted on the side-walls of that chapel. He also, along with other contemporary painters, decorated the Stanze of the Vatican; and his works there are the only frescoes that were spared when Raphael was commissioned to substitute his works for those formerly painted on the walls and ceilings. The fact of his having had Raphael for his pupil, has no doubt in one way increased the reputation of P., but it has also in some degree tended to lessen it, as, in many of P.'s best productions, the work of Raphael is confidently pointed out by connoisseurs, and, indeed, many important pictures, at one time acknowledged as his, are now ascribed to his great pupil. His high standing as a painter, however, is established by many admirable works, in which no hand superior to his own could have operated; and, with the exception, perhaps, of Francia, who in some respects is esteemed his equal, he is now acknowledged as the ablest of the masters of that section of the early Italian school in which religious feeling is expressed with great tenderness, in pictures remarkable for delicate execution. P.'s works are also distinguished by rich and warm colouring. An excellent example of this master's work may be studied in the collection of the National Gallery, London—No. 298. The Virgin Adoring the Infant Christ. P.'s reputation was high, when the introduction of the cinquecento style, by Leonardo and Michael Angelo, tended to throw into the shade the art of the earlier masters. Disputes ran high between the leaders of the old and new styles, and Michael Angelo is said to have spoken contemptuously of P.'s powers. This, of course, has biased Vasari's opinion in his estimate of the opponent of his idol, but P.'s reputation now stands very high, and his works are greatly esteemed. Raphael was about twelve years of age when he was entered as a pupil with P., who was then (1495) engaged on the frescoes in the Sala del Cambio (the Exchange) at Perugia. P. died at Castello di Fontignano, near Perugia, in 1524.

PERUVIAN ARCHITECTURE. Although the buildings of Peru were erected probably about the 12th c. A.D., they possess an extraordinary likeness to those of the Pelasgi in Europe. This resemblance in style must be accidental, arising probably from the circumstance, that both nations used bronze tools, and were unacquainted with iron. The Peruvian walls are built with large polygonal blocks of stone, exactly like what we call 'Cyclopean masonry.' The jambs of the doorways slope inwards, like those of Etruscan tombs, and have similar lintels. The walls of Cuzco are good examples of this style. It is further remarkable, that these walls are built with re-entering angles, like the fortifications which were adopted in Europe only after the invention of gunpowder.

PERUVIAN BARK. See *CINCHONA*.—But whilst the article Cinchona was passing through the press, an important event was taking place in the introduction of cinchonas, or Peruvian Bark trees into British India. This had long been urged on the East India Company by Dr Royle, but was not undertaken till after his death. The same thing had been attempted a year or two before by the Dutch in Java, on the urgent representations of the botanist Blume, but with very imperfect success, owing to their having procured chiefly plants of a species which produces bark of very inferior quality, and yields little quinine. But Mr Markham, who

PERUVIAN GOOSEBERRY—PESHITO.

was sent to North America by the East India Company to procure seeds and plants, and successful in introducing into British India, in the latter part of 1801, a number of the very best seeds, which were planted chiefly on the Neelgherry Hills, and partly also on the mountains of Coeylon and the Himalayas, and from these stations have begun to be diffused so that their cultivation for economical purposes has fairly begun. Young trees are already sold by thousands, and there is every prospect that, as many years have elapsed, an abundant supply of Peruvian bark, and consequently of quinine, will be secured at a very moderate price, and yet with profit to the East Indian cultivator. In procuring the young trees and seeds which he procured in China Mr. Markham experienced great difficulty from the jealousy of the South American governments, anxious to maintain a monopoly in this precious commodity, and yet taking no effectual means to prevent the rapidly extending waste of the bark in their native forests; whilst such is the want of enterprise among the people, that Mr. Markham in all his travels saw only one Peruvian Mark tree which had been planted by the hand of man. (See Markham's *Travels in Peru and India*, Lond. 1853.)

PERUVIAN GOOSEBERRY. See PHYALIS.

PESARO (the ancient *Pisaurum*), a town of Central Italy, capital of the province of the same name, on a rocky wooded hill, on the right bank of the Foglia, and one mile from the mouth of that river in the Adriatic 30 miles north-west of Urbino. Its streets are broad, and it is surrounded by walls and defended by a citadel. It is a bishop's seat, and contains a cathedral and other churches. The country in the vicinity is fruitful and beautiful; the hills at the distance being adorned the best in Italy. The port cannot now accommodate vessels of more than 10 tons burden, but is large enough to receive 1000 vessels of light draught. Silks, pottery, glass, and leather are manufactured; and an active trade in silk, hemp, and woollen goods is carried on. Pop. 20,000.

PESCHIERA, a frontier town and fortress of Austrian Italy, and a member of the famous Quadrilateral (q. v.), stands partly on an island in the channel of the Mincio, and partly on the right bank of that river at its outlet from the Lake of Garda. The town itself is a poor place of less than 200 inhabitants. P. commands the right bank of the river, and in connection with it is the massive work called the 'Malvi,' which covers the approaches of the river in that direction. During the French republican war, P. was a simple post town. Its fortification, however, have been greatly strengthened by the Austrians. It is surrounded by walls and by forts, bastions, fosses, and a covered way; and the purpose, which it is now intended to serve, besides that of forming an entrenched camp capable of accommodating a considerable number of troops, is to harass an army attempting to cross the Mincio by Goito or Valguarnera. The island portion of the town are extensive barracks, forming three sides of a square. P. is a station on the Milan and Venice Railway, and is also a station of the Austrian government railways that ply on the Lake of Garda. P. was taken by the Prussians, under King Charles Albert, in 1848, and was again invested by them in June 1859, after the battle of Solferino. The conclusion of the treaty of Villafranca, however (July 11, 1859), withdrew P. from a siege.

PESHAWER, or PESHAWUR, an important town, on the north-west frontier of India, capital of a province of the same name, 18 miles east of the

eastern extremity of Khyber Pass, and 160 miles east-south-east of Kabul. It is defended by a bastioned wall, and surrounded by a foss, the base of which prevents internal disturbance. At the commencement of the present century, P. had 100,000 inhabitants. Under the stern rule of the Sikhs, however, its trade languished, and its splendid mosques, many of them in the richest style of oriental architecture, fell into decay. It is on the route from Hindustan to Cabul and Khurasan by the Khyber Pass, and is the seat of a British garrison, maintained here for the purpose of preserving the security of the route. Under British protection the Jews, in reviving trade is becoming more active, and the appearance of the suburbs and environs is improved. Pop. 25,000. The province of P., included in the Punjab and formerly forming a portion of Afghanistan, is about 5500 square miles in extent, and has 400,000 inhabitants. It is exceedingly fruitful. It is well watered, and produces rice and fruits of the finest quality, and is the greatest stimulus.

PESHITO, or rather PESHITTO (Syriac, not, as generally supposed, 'simple,' 'faithful,' and 'Version,' but the 'explained,' i. e., translated, Bible), is the name given to the authorized Syriac Version of the Old and the greatest part of the New Testament. This version holds among the Syrian Christians the same place as the Vulgate in the Roman, and the 'Authorized Version' in the English Church. Many are the traditions about its origin. Thus, the translation of the Old Testament is supposed to date from the time of Solomon and Hiram; or to have been done by Asa, the priest; or, again, that it belongs to the time of the Apostle Thaddeus (Adamas), and Abgar, the King of Osrhoene, in the 1st c. after Christ. To the same period is also supposed to belong the translation of the New Testament, which is ascribed to Addai, a disciple of Thaddeus, the first Edessan bishop and martyr. Recent investigation has not as yet come to any nearer result than to place the latter version in the 2d, and the former in the 3d c., and to make Jewish-Christians the authors of both. Ephrem Syrus (q. v.), who wrote in the 4th c., certainly speaks of the P. as *Our Version*, and finds it already necessary to explain some of its terms, which had become obsolete. Five books of the New Testament (the Apocalypse and four of the Epistles) are wanting in all the MSS., having probably not yet formed part of the canon when the translation was made. The version of the Old Testament was made direct from the Hebrew, and by men imbued with the Palestinian mode of explanation. It is extremely faithful, and astonishingly free from any of those paradoxical tendencies which pervade more or less all the Targums or Aramaic versions. Its renderings are mostly very happy, and coincide in many places with those of the Septuagint, a circumstance which has given rise to the erroneous supposition that the latter itself had been drawn upon. Its use for the Old Testament is more of an exegetical for the New Testament, more of a critical nature. Anything like an edition of the P. worthy of its name, is still as much a desideratum as is a critical edition of the Septuagint or the Targums, and consequently investigators have as yet been unable to come to anything but very hazy conclusions respecting some very important questions connected with it. The *Old Testament* of the New Testament part dates Vienna 1655, that of the Old Testament is contained in the Paris Polyglot of 1645. Several portions of the P. have been translated again into Arabic. The Syriac translation of those parts of the New Testament which are not to be found in the P., but are now

incorporated into our Syriac Bibles, are of late and uncertain date.

PESTALOZZI, JOHANN-HEINRICH, was born at Zürich, 12th January 1745. His family belonged to the middle-class gentry. He was destined for the Christian ministry, but turned aside, however, from this profession, and betook himself to the study of law. To this pursuit he did not long remain constant. The perusal of Rousseau's *Emile*, and the unsatisfactory political condition in which he found Europe, united to disgust him with the artificial life of cities, and he accordingly removed to the country, to devote his life to farming. Purchasing some waste land (after he had acquired the necessary experience), he applied himself successfully to its cultivation, marrying about the same time the daughter of a wealthy merchant. His mind continuing to be afflicted by the contemplation of the unhappy condition of the masses of the people, he devoted himself, during the intervals of his work, to the consideration of the means best suited to promote their elevation. He was convinced that, by means of a sound education, a remedy might be found for the many evils by which he was surrounded, and by which society was infected. To give effect to his theories, he converted his own house into an orphan asylum, and endeavoured, by a judicious blending of industrial, intellectual, and moral training, to afford a specimen of sound education, and one so contrived as to be practicable as a national scheme. Meanwhile, the pursuit of his benevolent enterprises involved him, after the lapse of fifteen years (1775—1790), in bankruptcy. The failure of his plans, and the democratic tendency of his opinions, brought upon him a good deal of contempt and opposition. His only consolation was having saved from degradation and neglect upwards of 100 children, and having issued several volumes on education, containing the results of his experience, and his hopes for the future of the masses. Many subsequent attempts to found schools and to give a specimen of rational scholastic training, were made by P., with varying educational success, but with invariable pecuniary embarrassment. His writings, meanwhile, increased in number and importance. The great idea which lay at the basis of his method of intellectual instruction was, that nothing should be treated of except in a concrete way. *Objects themselves* became in his hands the subject of lessons tending to the development of the observing and reasoning powers—not lessons about objects. In arithmetic, he began with the concrete, and proceeded to the abstract; and into the teaching of writing, he for the first time introduced graduation. His special attention, however, was directed to the moral and religious *training* of children, as distinct from their mere *instruction*; and here, too, graduation and a regard to the nature and susceptibilities of children, were conspicuous features of his system. Almost all P.'s methods are now substantially adopted by the instructors of elementary teachers in the Normal Schools of Europe, and to no man perhaps has primary instruction been so largely indebted. He died in 1827 at Brugg, in the canton of Basel, overwhelmed with mortifications and disappointments.

PESTH, the most populous and important commercial city of Hungary, on the left bank of the Danube, opposite Buda (q. v.), and 171 miles east-south-east of Vienna by railway. It occupies a low and level site, and contrasts strongly with the antique, picturesque, and rock-built Buda, on the other side of the river. The two cities are connected by a magnificent suspension-bridge, erected in 1849, and

which spans a water-way of about 1500 feet. Communication is also facilitated by steam-ferries, which cross the river every hour. Along the P. side of the river runs a wide quay, paved and terraced, and backed by a handsome row of buildings, 1½ miles long. The city consists of five divisions—the Inner, Leopold, Theresa, Joseph, and Francis towns. The Inner town, on the bank of the Danube, is the oldest, and the other divisions surround it in the form of a semicircle. P. is the seat of the chief judicial courts of Hungary. Its university, founded at Tyrnau, was transferred to Buda in 1784, and thence was removed hither in 1784. It is attended by upwards of 1000 students, who are taught by 50 professors, and is richly endowed. Attached to it are a museum, a botanic garden, an observatory, and a library of 75,000 volumes. Of the chief buildings and institutions, the principal are the synagogue, a large and beautiful structure, completed in 1857; the New Buildings (*Neugebäude*)—an immense edifice, now used as barracks and as an artillery dépôt; the gymnasium; military school; academy of arts; national museum, with a library of 120,000 volumes, and valuable collections of coins, medals, and antiquities; veterinary school; the national and other theatres; and the Hungarian scientific society. The town contains several important silk-spinning factories, and the principal articles of manufacture are silk, cotton, leather, jewellery, and musical instruments. The distilling of brandy, and the grinding of grain into meal and flour, are among the most important branches of industry. There are 168 flour-mills driven by water, 8 driven by wind, and 4 by steam. Four great fairs take place here annually, which draw together a concourse of more than 30,000 strangers, and at which exchanges, amounting in value to upwards of 32,000,000 florins, are made. In the course of the year, about 8000 barges unload at the quay, and the trade is chiefly in wines, raw hides, honey, wax, and an inferior spirit made from plums. After Vienna, P. has the greatest trade of any city on the Danube. Pop. 130,000, made up of the most various nationalities—Germans, Magyars, Slovaks, Greeks, and Turks—the majority of whom are Roman Catholics.

P. is mentioned for the first time in the 12th c.; but although one of the oldest towns in Hungary, its importance dates only from the reigns of Maria Theresa and Joseph II. It was desolated by the Mongols in the 13th c.; and after the battle of Mohacs (q. v.), it fell into the hands of the Turks, who held it till 1686. At the beginning of the 18th c., it was an inconsiderable town, and has only risen into importance within the last 100 years. It has suffered much from inundations of the Danube on several occasions, on one of which, in 1838, 2280 houses were destroyed. In May 1849, while Görgei, with an army of 40,000 Hungarians, occupied the heights above Buda, and bombarded the fortress, which was held for the imperial government by General Hentzi, the latter general retaliated by bombarding P.; but on the night of the 20th May, the Hungarians stormed and took the fortress; and on the following morning, raised above its battlements the standard of revolt. On the field of Rákös, in the vicinity, where the great national assemblies of the Magyars used to be held, horse-races, on the English model, now take place annually.

PESTILENCE. The terms *Plague* and *Pestilence*, corresponding to the Greek *Loimos* and the Latin *Pestis*, have, until recent times, been used indiscriminately to denote any diseases of an epidemic character which affected large masses of the community, and were remarkable for their fatality,

such as the oriental plague, the growing sickness, scurvy, certain venereal forms of fever, &c. 'Petcho,' says De Cingis, in his learned work on the *Prætorio de Capas* (vol. i. p. 149), 'The term *Petcho* was applied by the Greeks to designate a species of epidemic intermittent fever; and the plague of *Asiatica* described by Theophrastus is manifestly an epidemic form of the same disease, which has been at all times in the country variously denoted on the coast and islands of the Mediterranean and Archipelago. The existence of *Petcho*, so frequently mentioned by Athenæus of Halicarnassus, and of *Plebe*, so often mentioned by Livy and other Roman historians in the early history of Rome, are manifestly the resultant or remittent continuous fever, which has been at all times the native product of that district, and which acquired after inundations of the Tiber, by a certain train of weather, the characters of a fever generally diffused, a very malignant, and a very varied distemper. Numerous instances of a similar miasmatic mode of expression occur in denigrating the remittent fevers of the middle ages and of modern times; and we find, even in the early history of the colonization of the West Indian Islands and the United States, frequent examples of the same plague being applied in the remittent fever of those regions, and especially to epidemic attacks of yellow fever. During the middle ages, we find the term *Petcho* applied to numerous disorders, such as scurvy, small-pox, erysipelas, epidemic sore throat, petechial fever, the sweating sickness, gonorrhœa gonorrhœa, erysipelas, &c.

Several Hebrew words are translated pestilence or plague, in the authorized version of the Old Testament. Some of these pestilences were sent as special judgments, and are beyond the reach of inquiry; others have the characteristics of modern epidemics, in so far as their action was not necessarily rapid, and they were general in their attacks. Sufficient data are not in our possession to enable us to identify with certainty any of these epidemics. It has been supposed by some critics that in some of these cases (as in Deuteronomy, xxvii. 27; Amos, iv. 10; and Zechariah, xiv. 12), and in the case of Hamathi the oriental plague is referred to; but Mr. Pauls (Smith's Dictionary of the Bible, vol. ii. p. 355) is of opinion that there is not any distinct notice of this disease in the Bible.

PETCHO. See PACHYCH.

PETAL. See CORDELL.

PETALD, an instrument for blowing open gates, demolishing railways, &c. It consists of a half-pipe of thick iron filled with powder and ball; this is firmly fastened to a plank, and the latter is provided with hooks, in order of its being attached securely to a gate, &c. The engines attached to the plank, lighted the slow-match by which it was to be fired, and fled. When the explosion took off it, a supporting column charged through the breast, while the ballast were yet in combustion. The petard has been almost universally superseded by the use of powder-lugs. Large petards contained as much as 15 lbs. of powder.

PETCHARY, the popular name of a number of species of the genus *Pyropterus*, sometimes ranked with the *Merula* (*Lanius*), and sometimes with the *Pyropterus* (*Muscivora*). The name seems to be derived from the cry of the GRAY P. (*P. Dorsalis*), a bird very common in the warm parts of America, and in some of the islands of the West Indies, gregarious and migratory, spending the spring and summer in the islands, and retiring to the eastern parts of the mainland from the end of September to the beginning of January. Its cry is a kind of shriek, consisting of three or four shrill

notes, incessantly repeated. The entire length of the GRAY P. is about 9½ inches. It is a very bold and strong bird, and is fearless of the young, will maintain the battle against any hawk. It feeds partly on insects, sometimes on hawking birds, and partly on berries. When fat, it is much esteemed for the table, and great numbers are shot on this account.—The *Petcho* P. (P. 17) mentioned is one of the most common birds of the West Indies. At certain seasons of the year, when very fat, it is in great request for the table. This bird has been observed to play with a large bottle, as a cat does with a mouse, letting it drop, and catching it before it can reach the ground. If in a very bold mood, and does not scruple to attack a dog passing near its nest.

PETCHO'RA, a large river in the north of European Russia, rising on the western slope of the Ural Mountains, flows north through the eastern parts of the governments of Volodga and Archangel to about 60° 30' N., then south-east for about 100 miles, and finally sweeping toward the north, and expanding into an estuary 80 miles wide, and full of islands, falls into the Arctic Ocean, after a course of 940 miles. It is said to be navigable for large river-boats for upwards of 700 miles. The estuary, which is open from the middle of June till the middle of September, has a depth of from 20 to 30 feet. The country through which this river flows is still quite unexplored; dense forests extend on both sides, and the character of the scenery is wild, arid, and melancholy. The forests abound in larchwood, now largely used to the construction of iron-clad vessels. Within recent years, a colony has settled at the mouth of the P., for the purpose of felling, dressing, and exporting timber.

PETECHIE. This term is given to spots of a dusky crimson or purple colour, quite flat, with a well-defined margin, and unaffected by pressure, which closely resemble *Reyden's*. These spots result from a minute extravasation of blood beneath the cuticle. They occur most frequently on the back, at the base of the elbow, and in the groin. They indicate an altered state of the blood, and are often symptoms of very serious diseases, as of typhus fever, plague, &c. They likewise occur in very severe cases of small-pox, measles, and scarlet fever, when their presence must be regarded as indicative of extreme danger.

PETER. See APOLLO, named originally *Strom*, was a native of Bethsaida, on the Lake of Tiberias. His father was called Jonas, and the name by which P. is known in Christian history was given to him by our Lord. He changed the name of origin (*Bar-Jona*) into *Cephæus*, a Syro-Chaldee word, which means 'rock' or 'stone,' and for which *Peter*, or, in the masculine form, *Petros*, is the Greek equivalent. He was a fisherman by occupation, and, together with his brother Andrew, was actually engaged in this occupation on the Sea of Galilee when our Lord called both to be his disciples, promising to 'make them fishers of men.' For this invitation they had been prepared by the preaching of John the Baptist, and they accepted it without hesitation. For the incidents recorded of P.'s life as a disciple, we must refer to the gospel narrative. These incidents all chiefly evince a warm and impulsive character, even down to the hour of weakness in which he denied his Master. It is plain from the gospel narrative that he was regarded by our Lord with special favour and affection, and the events which followed the ascension of our Lord fall in with this inference from that narrative. He was the first mover of the election

of a new apostle in the room of Judas Iscariot; he was the spokesman of the rest on the day of Pentecost; he it was who answered to the charges when they were brought before the council; he is the chief actor in the tragic scene of the death of Ananias and Sapphira; he was the first to break down the wall of the prejudice of race by receiving a Gentile convert into the church; he was the first to propound in the council of Jerusalem the question to be discussed as to the obligation of the Mosaic observances. The last incident of P.'s life supplied by the Scripture narrative is his presence in the council of Jerusalem, 49 A.D. Of his subsequent career, our only knowledge is derived from tradition. His special mission was to the Hebrew race, as Paul's to the Gentile; and he is supposed to have preached through Pontus, Galatia, Cappadocia, Asia, and Bithynia, chiefly to those of his own nation dispersed in these countries, all which are named in the address of the first of the two Epistles which he has left. Another tradition which, until the 16th c., met general acceptance, reports that he preached at Rome, that he took up his residence there as bishop, and that he there suffered martyrdom. This tradition is the main foundation of the Roman claim to supremacy in the church. It early encountered the opposition of the reformers; its first antagonist being a writer named Velerius, whose work was published in 1520, and who was followed by Flachius, Salmasius, and, above all, Spanheim. This view has found a few supporters even down to our own time; but the whole current of scholarship, Protestant as well as Catholic—from Scaliger, Casaubon, Usher, Pearson, Cave, &c., down to Neander, Gieseler, Bertholdt, Olshausen, and others in our own country—has accepted the Roman tradition without hesitation. The time of his going to Rome has also been the subject of much discussion. By some, he is alleged not to have gone to Rome till the year 63, or, at all events, a short time before his martyrdom; others date his first visit as early as 42 or 43, without, however, supposing his residence after this date to have been continuous. In his first Epistle, it is implied that at the time of writing it he was at Babylon; and the name Babylon is by many critics held to be employed as a mystic designation of Rome, in accordance with a practice not unusual with the Hebrews and other orientals; but there is nothing to fix very conclusively the date of this Epistle. He is held by Roman Catholic writers to have fixed his see at Antioch before his coming to Rome; but of this supposed event also, the date is uncertain. His martyrdom is fixed in, with much probability, the year 66, and is supposed to have been at the same time and place with that of St Paul. P. was sentenced to be crucified, and, according to the tradition (preserved by Eusebius from Origen), prayed that he might be crucified with his head downwards, in order that his death might exceed in ignominy that of his Divine Master.

PETER, EPISTLES GENERAL OF, the name given to two Epistles contained in the canon of the New Testament. They are called *general*, because they are not addressed to particular churches or persons, like those of St Paul; but (as in the case of the 1st Epistle) to all the Christians scattered throughout Asia Minor, or (as in the case of the 2d) to the entire body of Christians without exception. The objects of the 1st Epistle are to strengthen believers under trials; to exhort them to the earnest performance of all duties—personal, social, and domestic; and to demonstrate how thoroughly that performance depends on a spiritual recognition of Christ and his work. There is a strong eschatological tendency

in the Epistle; the apostle seems to grow more intensely serious, under the conviction that 'the end of all things is at hand' (chap. iv. 7). That the Epistle is the composition of Peter is very generally admitted. The external evidence is singularly strong; while the internal, derived from a consideration of style, sentiment, and doctrine, is equally so. We see in every sentence the ardent, impassioned, practical, unspeculative character of Peter, who held with a fine Hebraic vehemence of faith the great facts and principles of Christianity, but could not, like the more subtle and logical Paul, give them a systematic representation. Many critics have warmly praised the beauty and strength of the language.—The *Second Epistle* stands in a very different position from the first. So far as external authority is concerned, it has hardly any. The most critical and competent of the Fathers were suspicious of its authenticity; it was rarely if ever quoted, and was not formally admitted into the canon till the Council of Hippo, 393 A.D. The internal evidence is just as unsatisfactory. The great difference of style between it and the 1st Epistle is universally admitted. Bunsen, Ullmann, and Lange hold indeed that the second chapter is an interpolation, but consider the first and third genuine. Many of the ablest critics, however, regard the whole Epistle as a fabrication, and believe that its contents prove it was meant as an attack on the Gnosticism of the 2d century. [See the remarks on the Second Epistle of Peter in Neander's *Geschichte der Pflanzung und Leitung der Kirche durch die Apostel*.] The principal arguments adduced for maintaining its apostolic character are—1, that its rejection would endanger the authority of the canon; 2, that it is inexplicable how the church should have received it if it had not thought that Peter was the author.

PETER LOMBARD. See LOMBARD, PETER.

PETER-PENCE, the name given to a tribute which was collected in several of the western kingdoms, and offered to the Roman pontiff, in reverence of the memory of St Peter, of whom that bishop was believed to be the successor. From an early period, the Roman see had been richly endowed; and although its first endowments were chiefly local, yet as early as the days of Gregory the Great, large estates were held by the Roman bishops in Campania, in Calabria, and even in the island of Sicily. The first idea, however, of an annual tribute appears to have come from England, and is by some ascribed to Ina (721 A.D.), king of the West Saxons, who went as a pilgrim to Rome, and there founded a hospice for Anglo-Saxon pilgrims, to be maintained by an annual contribution from England; by others, to Offa and Ethelwulf, at least in the sense of their having extended it to the entire of the Saxon territory. But this seems very uncertain; and although the usage was certainly long anterior to the Norman Conquest, Dr Lingard is disposed not to place it higher than the time of Alfred. The tribute consisted in the payment of a silver penny by every family possessing land or cattle of the yearly value of 30 pence, and was collected in the five weeks between St Peter's and St Paul's Day and August 1. In the time of King John, the total annual payment was £199, 8s., contributed by the several dioceses in proportion, which will be found in Lingard's *History of England*, vol. ii. p. 329. The tax called Romescot, with some variation, continued to be paid till the reign of Henry VIII. when it was abolished. By Gregory VII., it was sought to establish it for France; and other partial or transient tributes are recorded from Denmark, Sweden, Norway, and Poland. This tribute

however, is quite different from the payments made usually to them by the kingdoms which were held to be tributary to the Roman see—see Naples, Sicily, England under the reign of John, and several other kingdoms, at least for a time.

The pope having suffered a considerable diminution of his own revenues since the revolution of 1845, an effort has been made in several parts of Europe to secure this income. In some countries, it has been very successful, and the proceeds have been among the chief of the resources by which this P. has been enabled to meet the expenses of military enterprises under which, with his diminished temporal possessions, it was supposed that he must necessarily have perished.

PETER THE HERMIT, the first mover of the great national drama of the thirteenth (q. v.), was of noble birth, and a native of Amiens, where he was born about the middle of the 11th century. Having long resided at Paris, and afterwards in Italy, he became a soldier. After serving in Flanders without much distinction, he retired from the army, married, and had several children; but on the death of his wife, he became a monk, and ultimately a hermit. In the course of a pilgrimage to the Holy Land about 1099, he was moved by observing that the Holy Scriptures were in the hands of the heathen, as well as by the depressed condition of the Christian territories or pilgrims under the Moslem rule, and on his return, spoke so earnestly on the subject to Pope Urban II., that that pontiff warmly adopted his views and commissioned him to preach throughout the West an ardent consideration of Christians for the deliverance of the Holy City. Moses in Egypt, and himself in vision, he enthused, lent him a power which no natural advantages of form could have commanded. 'He traversed Italy,' writes the historian of Latin Christianity, 'crossed the Alps from province to province, from city to city. He rode on a mule, with a crucifix in his hand, his head and feet bare; his dress was a long robe, girt with a cord, and a hermit's cloak of the coarsest stuff. He preached in the pulpit, on the roads, in the market places. His eloquence was that which wins the hearts of the people, for it came from his own soul, fervent, full of bold apprehensions; it was mingled with his own tears, with his own groans; he lent his breast: the contagion moved throughout his audience. His preaching appealed to every passion—in valour and shame, to indignation and pity, to the pride of the warrior, to the meekness of the man, the religion of the Christian, to the love of the brethren, to the hatred of the oppressor aggravated by his insulting tyranny, to the horror for the desecrated and the saints, to the desire of escaping sin, to the hope of eternal life! The results are well known, as among those moral masters of enthusiasm of which history presents numerous examples. All France, especially, was stirred from its very depths; and just at the time when the enthusiasm of that country had been already kindled to its full fervour, it received a stimulus and an authority from the decree of a sacred lord at Clermont, in which Urban himself was present, and in which his celebrated harangue was one of the signal to the outpouring, through all Western Christendom, of the same chivalrous ardour by which France had been borne away into the rude campaigns of the Hermit. For the details of the expedition, we must refer to the article *CRUSADES*; we will present concern being with the personal history of Peter. Of the emotions that anticipated every which assembled from all parts of Europe, one portion was committed to his conduct; the other being under the command of the more skillful leader, Walter the Pennycuik. P.

placed himself at their head, marched upon his own, with his horse swollen with him, and his ride beside him the march through Hungary, they became involved in hostilities with the Hungarians, and suffered a severe defeat at Sembo, whence they proceeded with much difficulty to Constantinople. There the Emperor Alex., filled with dismay at the want of discipline which they exhibited, was not too happy to give them stripes for their unaided march; and near Nice they encountered the army of the Sultan Solyman, from whom they suffered a terrible defeat. P. accompanied the subsequent expeditious under Geoffrey; but was not by the delays and difficulties of the siege of Antioch, he was about to withdraw from the expedition, and was only retained in it by the followers of the other leaders, who foresaw the great results from his departure. Accordingly, he had a share, although not marked by any great distinction, in the siege and capture of the Holy City in 1099, and the closing incident of his history as a crusader was an address to the victorious army delivered on the Mount of Olives. He returned to Europe, and founded a monastery at Bay, in the diocese of Langs. In his monastery, he died, July 7, 1112.

PETER (Dox Penno) THE CRUEL, King of Castile and Leon, was the son of Alfonso XI. and Maria of Portugal, and was born at Burgos, 20th August 1284. On his father's death (1295), P. succeeded to the throne without opposition, but left the whole exercise of power to his mother, Donna Maria, and Alphonso, her father's prime minister and chamberlain. But by the instigation of his mistress (afterwards his queen), Maria de Padilla, P. emancipated himself (1333) from the guidance of the queen-mother and her counsellor Alphonso, taking the reins of government in his own hands. His rule being much more impartial than that of the regency, obtained increasing popularity, which was increased by his affable manner towards the mass of his subjects but the strict justice with which he decided all causes between the rich and poor, the clergy and the laity, combined with a haughty and imperious carriage towards them, alienated from him the nobles and clergy. The plottings of Alphonso, who had fled to Portugal, having culminated (1334) in an outbreak in the province of Estremadura, P. marched against the rebels, but was betrayed by his brother, Henry of Trastamara, and taken prisoner (December 1334). Popular opinion now declared loudly in his favour; and having escaped from prison, he found himself speedily at the head of a powerful army, with which, despite the excommunication of the pope, he quickly reduced his opponents to submission. But this episode in his career had a disastrous influence on his character for the rest of his life. Betrayed by his relatives, and even by his mother, he became suspicious of every man and having experienced to the full the power of his enemies, he resorted not to the weapons to be employed against them. The rest of his reign was devoted to the destruction of the power of the great vassals, the establishment of his own authority on the ruins of their feudal tyranny, and long continued and bloody wars with the kingdoms of Aragon and Granada. As the people, however, were in general well and justly governed, it is not improbable that he might have retained his throne in spite of his numerous enemies, had not the heavy taxes which were imposed to maintain the cost of his long wars with Aragon and Granada dissipated his popularity. Henry, who had fled to France, now seeing the favourable opportunity, returned (1369) at the head of a body of valies, backed by Bertrand du Guesclin (q. v.) with an army of Gascones,

PETER I

and aided by Aragon, France, and the pope. P., however, by promising to England the sea-board of Biscay, with the provinces of Guipuzcoa and Logrono, and supplying a contribution of 56,000 florins, prevailed upon Edward the Black Prince to espouse his cause. Edward invaded Castile in the spring of 1367, totally defeated Henry and Du Guesclin at Navarette (April), taking the latter prisoner (releasing him almost immediately after), and speedily restoring P. to the throne. But the king disgusted his chivalrous ally by his cruelty to the vanquished, and paid no heed to his remonstrances; Edward accordingly repassed the Pyrenees, and left the misguided monarch to his fate. The whole kingdom groaned under his cruelties; rebellions broke out everywhere; and, in autumn 1367, Henry returned with 400 lances, the people immediately flocking to his standard. P.'s scanty and ill-disciplined forces were routed at Montiel (14th March 1369), and himself compelled to retire for safety within the town, whence he was treacherously decoyed and captured by Du Guesclin. He was carried to a tent, where a single combat took place between him and Henry, in which the latter would have been slain, had not some of his followers come to his aid, and slain the unfortunate P., 23d March 1369.

PETER I., ALEXIEVITCH, Czar of Russia, generally denominated PETER THE GREAT, was the son of the Czar Alexei Mikailovitch by his second wife, Natalia Naryskine, and was born at Moscow, 9th June 1672. His father, Alexei, died in 1676, leaving the throne to his eldest son, Feodor, P.'s half-brother. This prince, however, died in 1682 without issue, after naming P. as his successor, to the exclusion of his own full brother, Ivan. This step immediately provoked an insurrection, fomented by the children of the Czar Alexei's first marriage, the most prominent among whom was the grand-duchess Sophia, a woman of great ability and energy, but of unbounded ambition. Disdaining the seclusion customary among the females of the royal family, she shewed herself to the *Strelitz* (q.v.), excited them to fury by an ingenious story of the assassination of her brother Ivan, and then let them loose on the supporters of P.'s claims. After a carnage of three days, during which more than sixty members of the most noble families of Russia were massacred, she succeeded in obtaining the coronation (July 1682) of Ivan and P. as joint rulers, and her own appointment as regent. Up to P.'s coronation his education had been greatly neglected, but after this time he became acquainted with Lieutenant Franz Timmerman, a native of Strasburg, who gave him lessons in the military art and in mathematics; after which he had the good fortune to fall under the guidance of Lefort (q.v.), a Genoese, who initiated him into the sciences and arts of civilisation, and by shewing him how much Muscovy was in these respects behind the rest of Europe, influenced the whole of his future career. Lefort also formed a small military company out of the young men of noble family who attended P., and caused P. himself to pass, by regular steps, from the lowest (that of drummer) to the highest grade in it, rendering him all the while amenable to strict discipline. This course of training, in all probability, saved P. from becoming the mere savage despot, which his brutal and passionate disposition, and indomitable energy inclined him to be; it also protected him from the jealousy of his half-sister, the regent Sophia, who, seeing him absorbed in military exercises and other studies, imagined that he had wholly given himself up to amusement. She, however, soon discovered her error, for P., contrary to her wishes, married (February 1689), by his mother's advice, Eudoxia

Feodorowna, of the family of Lapoukin; and in October of the same year, called upon his sister to resign the government. In the ensuing contest, P. was at first worsted, and compelled to flee for his life; but he was speedily joined by the foreigners in the Russian service, with a Scotchman named Patrick Gordon (q.v.) and the Swiss Lefort at their head; and the *Strelitz*, who were his antagonist's mainstay, flocking to his standard, she resigned the contest, and was shut up in a convent, whence, till her death, in 1704, she did not cease to annoy him by her intrigues. On October 11, 1689, P. made his public entry into Moscow, where he was met by Ivan, to whom he gave the nominal supremacy and precedence, reserving the sole exercise of power for himself. Ivan only enjoyed his puppet sovereignty till 1696. Though P. was all his life under the dominion of ungovernable passions and sensual habits, yet during great part of his reign he was so exclusively engaged in projecting and carrying out his schemes for the regeneration of Russia, that his gross animal nature had little opportunity of displaying itself.

His first care, on assuming the government, was to form an army disciplined according to European tactics, in which labour he was greatly aided by the valuable instructions of Gordon and Lefort, both of whom were military men, and had served in some of the best disciplined armies of Western Europe. He also laboured to create a navy, both armed and mercantile; but at this period Russia presented few facilities for such an attempt, for she was shut out from the Baltic by Sweden and Poland (the former of whom possessed Finland, St Petersburg (then called Ingria), and the Baltic provinces), and from the Black Sea by Turkey, which, extending along the whole of the north coast, had reduced that sea to the rank of an inland lake; leaving only the White Sea and the Arctic Ocean, with the solitary port of Archangel, available for the Russian navy. P. thinking the possession of a portion of the Black Sea would best supply the required facilities of accessible sea-board and port, declared war against Turkey, and took (1696) the city of Azof at the mouth of the Don, after a long siege, which the ineffective condition of his newly-disciplined army compelled him to convert into a blockade. Skilled engineers, architects, and artillerymen were now invited from Austria, Venice, Prussia, and Holland; ships were constructed; the army further improved both in arms and discipline; and many of the young nobility ordered to travel in foreign countries, chiefly in Holland and Italy, for the purpose of acquiring such information as might be useful in the modernisation and civilisation of their country. They were ordered to take special notice of all matters in connection with ship-building and naval equipments. Others were sent to Germany to study the military art. Not quite satisfied with this arrangement, P. was eager to see for himself the countries for which civilisation had done so much, and which had so highly developed the military art, science, trade, and industrial pursuits; so after repressing a revolt of the *Strelitz* (February 1697), and dispersing them among the various provinces, he intrusted the reins of government to Prince Romonadofski, assisted by a council of three, and left Russia in April 1697, in the train of an embassy of which Lefort was the head. In the guise of an inferior official of the embassy he visited the three Baltic provinces, Prussia, and Hanover, reaching Amsterdam, where, and subsequently at Saardam, he worked for some time as a common shipwright. His curiosity was excessive; he demanded explanations of everything which he did not understand; and to his practice of ship-building

and learned trades, he added the study of astronomy, natural philosophy, geography, and even anatomy and surgery. On receipt of an invitation from William III., King of England, he visited that country, and for three months spent partly in London and partly at Oxford, laboured to amass all sorts of useful information. While in England he received the honorary degree of D.C.L. from the university at Oxford. Having returned in April 1699, carrying with him English weapons, artificers, surgeons, artisans, artillerymen, &c., to the number of 200, and next visited Vienna, for the purpose of inspecting the conduct of Austria's army. When the host in Russia. He was about to visit Venice also, when the news of a formidable rebellion of the Cossacks reached him at Moscow, which he reached by way of Poland, arriving at Moscow 24th September 1700. Insurgent feeling had already existed there, but these turbulent soldiers had so outraged P. against them by their frequent outbreaks, that he ordered for whole of them to be executed, even occasionally waiting to poison on the scaffold. A few, however, were pardoned, and sent to settle at Astrakhan. The famous Polukha, who was suspected of complicity in the conspiracy, which had been the work of the old Russian or anti-reform party, was divorced, and shut up in a convent, like some of his sisters. Martha was likewise compelled to take the veil. To show his gratitude to his faithful adherents, P. conferred upon the chief of them the Order of St. Andrew, now first instituted. He put the press on a proper footing, caused translations of the most substantial works of foreign authors to be made and published, and established naval and other schools. At this period, the ordinary arithmetic was first introduced for the management of accounts, those having been previously kept by means of balls strung on a wire (the Tartar method). P. also introduced the mode of raising revenues by taxation of commodities in common use. Trade with foreign countries, which was formerly punished as a capital crime, was now permitted, or rather, in the case of the principal commodities, assisted upon. Many manufactures, such as dresses, muslins, and cloths, were introduced artificially among the public authorities, and recommended to the people at once. Even the organization of the national church could not escape P.'s reforming tool.

In 1700, P., desirous of gaining possession of Livonia and Ingria, provinces of Sweden, which had formerly belonged to Russia, entered into an alliance with the kings of Poland and Denmark to make a combined attack on Sweden, taking advantage of the minor age of its monarch, Charles XII., but he was successfully defeated at Narva, his raw troops being utterly unable to cope with the Swedish veterans. P. was by no means discouraged, for, taking advantage of the Swedes being employed elsewhere, he quietly appropriated a portion of Livonia, in which he laid the foundation of the new capital, at Petersburg, 27th May 1703. Great movements were held out to those who would settle in it, and in a few years it became the Russian commercial depot for the Baltic. In the engagement with Sweden, the Russians were almost annihilated, but P. rather rejoiced at this, as he felt that these veterans were administering to his troops a more lasting and effective discipline than he could have hoped to give them in any other way. He had the revenue at last, in totally routing the Swedish king at Poltava in 1709, 28th July 1709, and he won the whole of the Baltic provinces and a portion of Finland in the following year. His successful Russian helped much to consolidate his power, and to render his subjects more favourably disposed towards the new order of things. After

re-organizing his army, he prepared for strife with the Turks, who, at the instigation of Charles XII. (then residing at Bender), had declared war against him. The Ottoman Empire. In this contest P. was reduced to such straits that he despaired of escape, and looking forward to death or captivity, wrote a letter to his chief nobles, instructing them against obeying any orders he might give them while a captive, and advising them to report a message to the Grand Seignior in case of his death. But the fitness and ability of his ministers, Catharine, afterwards his wife and successor (see CATHARINE I.), preserved him from his difficulties, and a treaty was concluded (28th July 1713) by which Peter had only his previous conquest—the part of Kiev and the territory belonging to it—that cut from the Black Sea, the possession of a good harbour on the Baltic became the more necessary to him, and the war against Sweden in Pomerania was accordingly pushed on with the utmost vigour. On 23 March 1712, his marriage with his mistress, Catharine, was celebrated at St. Petersburg; and two months afterwards, the offices of the central government were transferred to the new capital. His arms in Prussia and Poland were crowned with success, and in 1713 the latter province was completely subdued. P. neglected nothing to develop the naval power of the empire, and the strictness with which he enforced the discharge of their duties on his ministers and officers appears from the refusal, by the want of ability, of the czar's own application for the grade of vice-admiral, until by selecting the Swedish fleet at Hango, and taking the Åland Isles and several coast-forts in Finland, he had merited the honour. In the end of 1716, and beginning of 1717, in company with the empress, he made another tour of Europe, this time visiting Paris, where he was received with great enthusiasm, and returned to Russia in October 1717, carrying with him books, paintings, statues, &c., to a large amount. It was soon after this time that he ordered his son Alex. (q.v.) to be executed, and more of the nobles who had been implicated in his treasonable plans were punished with savage severity. In 1721 peace was made with Sweden, and on condition of that power giving up the Baltic provinces, Ingria (now government of St. Petersburg), Viborg, and Rosholm, and a small portion of Poland, with all the islands along the coast from Orskund to Viborg, she restored back the rest of Finland, with a sum of 2,000,000. In 1722 P. commenced a war with Persia, in order to open up the Caspian Sea to Russian commerce (see PERSIA). The internal troubles of Persia compelled the shah to yield to the demands of his formidable opponent, and to hand over the three Caspian provinces along with the towns of Derband and Baku. On P.'s return to his capital, he inquired into the conduct of his finance ministers, and punished with fines, imprisonment, and even death, those whom he detected in fraudulent acts. To save the empire which he had established and constituted from being abandoned to the weak government of a minor, he, in February 1722, promulgated his celebrated law of succession (see PETER II.). For the last years of his life he was chiefly engaged in beautifying and improving his new capital, and carrying out plans for the general diffusion of knowledge and education among his subjects. In the autumn of 1724 he was seized with a serious illness, the result of his impudence and now habitual excesses; and after enduring much agony, he expired, 28th February 1725, in the arms of the empress.

PETER II., ALEXANDRITCH, Czar of Russia, was the sole male representative of Peter the Great, being the son of the unfortunate Alex. (see

PETER III.—PETERBOROUGH.

PETER I.) by his wife the Princess Charlotte of Brunswick-Wolfenbützel, and was born 23d October 1715 at St Petersburg. On the death of the Czarina Catharine I, he ascended the throne, May 17, 1727, in accordance with a decree of Peter the Great, which enjoined that each czar should name his successor; and the ambitious Menchikoff, who hoped to govern more easily in the name of a minor, prompted the empress to choose P. In order to secure himself in his high position, Menchikoff affianced one of his daughters to the youthful czar, and compelled his relative, Anna Petrowna, and her husband, the Duke of Holstein, to retire to their own estates. But, notwithstanding these and other precautions, his power was overturned by a mere child, a playfellow of the boy-ruler, who was of the powerful family of Dolgorouki. Instigated by his friends, this boy, Ivan Dolgorouki, opened the eyes of his sovereign to the humiliating dependence in which he was held by Menchikoff, and inspired him with a strong desire to free himself. The plan succeeded, and the minister and his family were exiled to Siberia, the Dolgorouki family taking their place as favourites. The marriage of a lady of this family with P. had been arranged, and was almost on the point of being celebrated, when he was seized with small-pox, and died at St Petersburg, January 29, 1730. During his reign, the three Caspian provinces, Asterabad, Ghilan, and Mazanderan, which had been seized by Peter the Great, were recovered by Persia.

PETER III. FEODOROVITCH, Czar of Russia, grandson of Peter the Great (being the son of his eldest daughter Anna Petrowna, wife of Karl Friedrich, Duke of Holstein-Gottorp), was born at Kiel, March 4, 1728, and on November 18, 1742, was declared by the czarina Elizabeth (q. v.), her successor on the throne of Russia. From the time of his being publicly proclaimed heir, he lived at the Russian court; and, in obedience to the wishes of the czarina, married Sophia-Augusta, a princess of Anhalt-Zerbst, who, on entering the Greek Church (a necessary condition of marriage of a foreigner with the czar present or presumptive), assumed the name of Catharina Alexiowna. P. succeeded Elizabeth on her death, June 5, 1762; and his first act of authority was to withdraw from the confederate league of France, Austria, and Russia against Prussia, restoring to the heroic monarch of the latter kingdom, Frederic II., the provinces of Prussia Proper, which had been conquered during the Seven Years' War, and sending to his aid a force of 15,000 men; a line of conduct which seems to have been prompted solely by his admiration for the Prussian sovereign. He also recalled many of the political exiles from Siberia, among whom were L'Estocq, Munnich, and the Duke of Courland; abolished the sanguinary law which proscribed any one who should utter a word against the Greek church, the czar, or the government; and then attempted the realisation of his favourite project, which was to recover from Denmark that portion of Slesvig which had been ceded to her in 1713, and to avenge the tyranny and annoyances to which his family—that of Holstein-Gottorp—had been subjected. But before the army he had despatched could reach its destination, a formidable conspiracy, headed by his wife, and supported by the principal nobles, had broken out against him. This conspiracy originated in the general discontent which was felt at the czar's conduct and government; for the nobility were offended at his liberal innovations, and the preference he shewed for Germans; the people and clergy, at his indifference to the national religion, and his ill-concealed contempt for Russian manners and customs; while the whole nation

murmured at his servility to Frederic II. of Prussia. His wife had still deeper cause for dislike; for though he was himself addicted to drunkenness and debauchery, he never ceased to reproach her with her infidelities, and had even planned to divorce her, disinherit her son Paul (q. v.), and elevate his mistress Elizabeth Woronzof to the conjugal throne. The revolution broke out on the night of the 8th July 1762; P. was declared to have forfeited his crown, and his wife Catharine was proclaimed czarina as Catharine II. (q. v.) by the Guards, the clergy, and the nobility. P., who was then at Oranienbaum, neglecting the counsels of Field-marshal Munnich, who proposed to march at once on the capital at the head of the regiments which were still faithful, or at any rate to take possession of Cronstadt and the fleet, soon found even the opportunity of flight cut off, and was compelled to submit. He abdicated the crown on 16th July, and on the 14th of the same month was put to death by Orlof (q. v.), to secure the safety of the conspirators.

PETERBOROUGH, an episcopal city and parliamentary borough of Northamptonshire, stands on the left bank of the Nen—which is thus far navigable for boats—37 miles north-east of Northampton, and 76 miles north-north-west of London by railway. The Great Northern, the Eastern Counties, the Northampton and Peterborough, and the Midland Counties' railways pass the city, and have stations here. P. is regularly laid out, has an excellent grammar-school with an endowment, a corn-exchange in the Italian style, a jail and house of correction, a handsome parish-church, and a number of chapels and meeting-houses, schools, and charitable institutions.

But the great edifice of P. is the famous cathedral, which holds a high, if not the highest rank among English cathedrals of the second class. The choir and eastern aisles of the transept (dating 1118—1133) are early Norman; the transept (1155—1177) is middle Norman; the nave (1177—1193) is late Norman; the western transept (dating from the same period), is transition Norman; the west front, which, as a portico (using that term in its classical sense), is said to be the grandest and finest in Europe, is early English; and the eastern aisle (begun in 1438, but not completed till 1528), is Perpendicular. The beautiful western front consists of three arches 81 feet in height, supported by triangular piers detached from the west wall. Each arch is surmounted by a beautiful pediment and cross. The front is flanked on each side with turrets 156 feet high, and crowned with pinnacles. The roof of the nave is painted to lozenge-shaped divisions, containing figures of kings, bishops, grotesques, &c., in colours. A central tower, lantern-shaped, rises at the intersection of the nave and transept. In the north-choir aisle, a slab of blue stone still covers the remains of Catharine of Aragon. On the stone is carved the simple inscription, 'Queen Catharine, A.D. 1536.' In July 1557, the remains of Mary, Queen of Scots, were brought here from Fotheringhay for interment, and here they rested until, twenty-five years after, they were removed to Westminster Abbey. The entire length of the cathedral is 476 feet 5 inches; the breadth of nave and aisles, 78 feet; height of the ceiling of the church, 78 feet; breadth of the church at the great transepts, 203 feet; height of lantern, 135 feet; length of western front, 156 feet; height of central tower from the ground, 150 feet.

P. carries on an active trade in corn, coal, timber, lime, bricks, and stone. The borough returns two members to the House of Commons. Pop. of parliamentary borough (1851), 8672; (1861), 11,735.

PETERBOROUGH—PETER'S ST. CHURCH.

The city had its origin in a great Benedictine monastery, founded in 655 by Æthel, King of East Angles, and Peada, son of Peada, King of Mercia. The monastery, which became one of the wealthiest and most important in England, was named in honour of St. Peter, but it was not until the town destroyed by the Danes in 867, and rebuilt about 900, that the town was called Peterborough. On the dissolution of the monastery, the cathedral abbey was spared, owing, it is supposed, to its containing the remains of Queen Ethelburga of Argyre.—*Murray's Handbook to the British Isles*.

PETERBOROUGH, Lond. See ABERDEEN.

PETERHEAD, a seaport and municipal and parliamentary burgh, Aberdeenshire, situated on a peninsula, the most eastern point of land in Scotland, 41 miles north-west-east of Aberdeen, by the Great North of Scotland Railway. It is irregularly built, is clean, and is noted in many cases with the redish granite, which receives its name from the town. A large portion of the parish, and the superiority of the town of P. formerly belonged to the Bursche family, 1716. This valuable possession became, in process of time, by purchase the property of the Merchant Assize Hospital of Edinburgh, the proceeds of whose have lately done much in the way of improvement both for the town and port. It contains no very striking edifices. Its parish church has a granite tower, 118 feet in height, and a granite pillar of the Roman order stands on the tower-cess. There are five royal Free Churches, Scotch, Methodist, and other assembly, an academy and other schools, and two libraries. Recently, both and woollen manufactures have been introduced, ship-building is carried on to a considerable extent; herring, cod-fish, haddock, salmon, and granite are exported, and lime, wool, and general merchandise are imported. P. was long famous as the great depot of the seal and whale fisheries in Scotland, but within recent years the fisheries have been generally unprofitable, and this interest has declined. In 1864 about 32 vessels, a larger number than flow sail out by any other British port, were employed in the different branches of this trade. The seal fisheries are still vigorously prosecuted, and in the season a fleet of fast herring-boats put out from the harbour in the evening. P. is the most thriving station in Scotland. In 1865 upwards of 77,000 barrels of dried herring were exported to the continent. In 1865, 1664 vessels of 26,450 tons moved and cleared the port. The two harbours are especially on the north and south side of the haven of the peninsula on which the town is built, and a passage connecting them has been cut across the isthmus, so that vessels can leave harbour in any state of the wind. The town has often been proposed as a Harbour of Refuge for the south coast of this bay of P., and about 25 miles from the town, at Borthwick, and near it are the two towers known as Borthwick Castle. (Average and Borthwick castle, now mere ruins, are finely situated on the banks of the Ugie, which enters the sea a mile north of the town. P. enters with the town in 1865 borough in seeking a division to parliament. Pop. of parliamentary burgh (1861) 1867 (1861), 7241.

PETERLOO MASSACRE, the name popularly given to the dispersal of a large meeting by armed men in St. Peter's Field, Manchester, Monday, July 16, 1819. The assembly, consisting chiefly of leaders of opposition from different parts of Lancashire, was called to consider the question of parliamentary reform, and the chair, an open hustings, was occupied by Mr Henry Hunt. The dispersal

took place by order of the magistracy, several troops of horse, including the Manchester Yeomanry, being concerned in the affair, of which an account will be found in *History of the Peace*, by Herbert Martineau, edition of 1865, p. 167. Five or six persons were killed and many wounded. St. Peter's Field is now covered by buildings. Peterloo was a beautiful term suggested by Watson.

PETER'S ST. CHURCH, at Rome, is the largest cathedral in Christendom. It stands on the site of a much older building, founded by Constantine A. D. 320, near the reported grave of St. Peter, and near the spot where he is said to have suffered martyrdom. This building was of great stuccoed magnificence, but had fallen into decay, when Pope Sixtus V., in 1585, resolved to erect a new cathedral, worthy of the dignity and importance of the Roman pontificate, from in the south of the town. A design was accordingly prepared by Bramante on a very grand scale, and the edifice was begun, when the pope died. The new building consisted projected for about half a century, when Urban II. resolved to carry out the building and employed Bramante, then celebrated as an architect, to make a new design. This design still exists. The foundation stone was laid, in 1606, and the works carried on with great activity till the death of the pope in 1623. Bramante, who died the following year, was succeeded by Michelangelo Peruzzi. Almost every architect who was employed during the long course of time required for the erection of this great edifice, proposed a new design. That of Sans Galle, who succeeded Peruzzi, is one of the best, and is still preserved. It was not till his death in 1646, when his superintendence devolved on Michael Angelo, that seventy-two years of architectural progress was made. He designed the dome, and had the satisfaction, before his death in his sixtieth year (1664), of seeing the most sublime part of the task completed; and he left such complete models of the remainder that it was carried out exactly in conformity with his design by his successors, Vignola and Giovanni Della Porta, and successfully terminated by the latter in 1660 in the pontificate of Sixtus V. The design of Michael Angelo was in the form of a Greek cross, but the building was actually completed as originally designed by Bramante as a Latin cross, under Paul V., by the architect Carlo Maderno. The portico and facade were also by him. He is much blamed for altering Michael Angelo's plan, because the result is that the projecting nave prevents the dome (the great part of the work) from being well seen. The facade is considered poetry, and too much cut up into small pieces. It is observable that this entrance facade is at the east end of the church, not the west, as it would certainly have been north of the Alps. But in Italy the principle of orientation was little regarded.

Maderno's nave was finished in 1612, and the facade in 1614, and the church dedicated by Urban VIII. in 1623. In the front of the portico is a magnificent atrium in the form of a piazza, enclosed on two sides by grand semicircular colonnades. This was erected under Alexander VII. by the architect Bernini.

The facade of the cathedral is 389 feet long and 145 feet high. As already mentioned, the design is not generally approved, but some allowance must be made for the prominence of the nave. The altarpieces in the front were required, as the pope, at Easter, always bestows his blessing on the people from them. Five open arches lead into a magnificent vestibule 450 feet long, 47 feet wide, and 25 feet high, and adorned with statues and mosaics. Here is preserved a celebrated mosaic of St. Peter

PETER'S, ST, COLLEGE—PÉTION DE VILLENEUVE

walking on the sea, called the Navicella, designed by Giotto in 1298, and preserved from the old basilica. The central bronze doors are also relics saved from the old church. On entering the interior of the cathedral, its enormous size does not produce the impression its grandeur of proportions should do on the spectator. This arises from the details being all of an excessive size. The pilasters of the nave, the niches, statues, mouldings, &c., are all such as they might have been in a much smaller church, magnified. There is nothing to mark the scale, and give expression to the magnitude of the building. The figures supporting the holy water fountain, for example, appear to be those of cherubs of a natural size, but when more closely approached, turn out to be six feet in height, and the figures in the niches are on a still more colossal scale. The cathedral is 613 feet long, and 450 feet across the transepts. The arch of the nave is 90 feet wide, and 152 feet high. The diameter of the dome is 195½ feet. From the pavement to the base of the lantern is 405 feet, and to the top of the cross 434½ feet. The dome is thus 50 feet wider, and 64 feet higher than that of St Paul's (q. v.) in London.

The walls of the interior are adorned with plates of the richest marbles, and copies of the most celebrated paintings executed in mosaic. The arch piers have two stories of niches with statues of saints, but these, unfortunately, are in a debased style of art. The pavement is all in marbles of different colours, arranged in beautiful patterns designed by Giacomo della Porta. The dome is, however, the finest part of the cathedral; it is supported on four great arches. Immediately under the dome stands the high altar over the grave of St Peter. It is surmounted by a magnificent baldacchino or canopy, in bronze, which was designed by Bernini in 1633, and executed with bronze stripped from the Pantheon by Pope Urban VIII. Beneath the high altar is the shrine, in which 112 lamps burn day and night. The building is adorned with many remarkable monuments and statues, some of them by Michael Angelo, Canova, and Thorwaldsen. The most of the monuments are erected in memory of the popes, but there is one to 'James III., Charles III., and Henry IX., kings of England,' the remains of the exiled Stuarts being buried in the vaults beneath. The 'Grotte Vaticane,' or crypt, has been most carefully and religiously preserved during all the changes and works of the cathedral; so much so, that the ancient pavement remains undisturbed.

As a work of architectural art, St Peter's is the greatest opportunity which has occurred in modern times; but, notwithstanding the great names of the men who were engaged upon the work, it is universally admitted to be a grand and lamentable failure.

PETER'S, ST, COLLEGE, Cambridge, commonly called Peter-House, was founded before any other college now existing in England—viz., in 1257, by Hugh de Balsham, Bishop of Ely, and was endowed by him in 1282, with a maintenance for a master and 14 fellows. In addition to the 14 original foundation-fellows, there are eight bye-fellows on different foundations, and 23 scholars. The master is elected by the society.

PETERSBURG, a city and port of entry of Virginia, U. S., on the south bank of the Appomattox river, 12 miles above its junction with James River, at City Point. It is 30 miles south of Richmond. Five railways contribute to make it the third city in the state. It has gas and waterworks, custom-house, court-house, mechanics'

hall, public library of 5000 vols.; 4 banks of issue; 4 savings banks; 3 daily and 2 weekly papers; 14 churches, 4 of which are for people of colour; 5 manufacturing establishments, among which 20 manufacture 26,000,000 lbs. of tobacco, the chief staple. In the campaign of 1864, Lieutenant-General Grant, commander of the Federal army, failing to take Richmond, besieged P., and was repulsed in several attacks by General Beauregard, with heavy loss. Pop. (1860) 18,266.

PETERSBURG, St. See **St PETERSBURG**.

PETERSFIELD, a parliamentary borough and market-town in Hampshire, 23 miles east-northeast of Southampton, and 55 miles south-west of London by railway. It is a pleasant country-town, and contains a Norman parish chapel of the 12th c., and an educational institution, called Church's College. An equestrian statue of William III., once richly gilt, stands in the market-place. P. returns a member to the House of Commons. Pop. (1861) of town, 1466; of borough, 5655.

PETERWARDEIN, the capital of the Slavonic-Servian military frontier, and one of the strongest fortresses in the Austrian dominions, is situated in a marshy, unhealthy locality on the right bank of the Danube, 50 miles north-west of Belgrade. The ordinary garrison consists of 2000 men, besides which the town and suburbs contain a population of about 4600, mostly Germans. The most ancient part of the fortifications, the Upper Fortress, is situated on a rock of serpentine, which on three sides rises abruptly from the plain. P., situated on a narrow peninsula formed by a loop of the Danube, occupies the site of the Roman *Acumincum* (acuminc point), and is said to have been named in honour of Peter the Hermit, who marshalled here the soldiers of the first crusade. In 1688, the fortifications were blown up by the imperialists, and the town was soon after burned to the ground by the Turks; but at the Peace of Passarowitz, on 21st July 1718, it remained in the possession of the emperor. It was here that, on 5th August, 1716, Prince Eugene obtained a great victory over the Grand Vizier Ali.

PETIOLE. See **LEAVES**.

PÉTION DE VILLENEUVE, **JÉRÔME**, not 1 for the part he played in the first French Revolution, was the son of a procurator at Chartres, and was born there in 1753. He was practising as an advocate in his native city, when he was elected in 1789 a deputy of the *Tiers Etat* to the States-General. His out-and-out republican principles, and his facile oratory, sonorous rather than eloquent, quickly made him popular, though he had an essentially mediocre understanding, and was altogether a windy, verbose personage. He was a prominent member of the Jacobin Club, and a great ally of Robespierre; the latter was called the 'Incorruptible,' and P. the 'Virtuous.' He was sent along with Barnave and Latour-Maubourg to bring back the fugitive royal family from Varennes, and in the execution of this commission he acted in an extremely unfeeling manner. He afterwards advocated the deposition of the king, and the appointment of a popularly elected regency, and along with Robespierre received, 30th September 1791, the honours of a public triumph. On the 18th of November, he was elected *Maire de Paris* in Bailly's stead, the court favouring his election, to prevent that of Lafayette. In this capacity he encouraged the demonstrations of the lowest classes, and the arming of the populace. But as the catastrophe drew near, he awoke to a sense of its terrible nature, and sought in vain to arrest the torrent. On the triumph of the

Parsons. P's popularity declined, and he joined the Jacobins. On the King's trial, he voted for death, but with delay of execution and appeal to the people, upon which he became suspected of being a royalist, and of partaking in the business of *émigrés*. He was thrown into prison, 2d June 1793, on the fall of the Girondins, but escaped from prison, and joined the other Girondists at Lyons. Upon the defeat of their army by that of the Convention he fled, in July 1793, into Montagn, and in company with Danton reached the neighbourhood of Bourdeaux, which, however, had already submitted. A short time after P's and Danton's names were found in a post-bill near St. Julien, partly destroyed by wolves. They were accused to have died by their own hands. P's character has been defended by Madame de Genlis and Madame de Mollat. It appears that he was extremely violent both in domestic relations; but, on the other hand, his public career shows him to have been weak, shallow, insatiable, and vain. *De l'homme de Pelet*, containing his speeches and some small political treatises, were published in 1793.

PETTITIO PRINCIPU (P's begging of the prince or queen) is the name given to legal to the source of claims reasoning in which the proposition to be proved is assumed in the premises of the conclusion.

PETITION (*lat. peto, I ask*), a supplication presented to one capable of granting it. The right in the United Kingdom to petition the sovereign or either House of Parliament for the redress of grievances is a fundamental principle of the British Constitution, and has been exercised from very early times. The earliest petitions were generally for the removal of private wrongs, and the mode of laying them was petition *valle* (i.e. legislative). Grievances and others of petition were appended, and proclamation was made inviting all persons to come to the answer. The result, which was either in favour of the petition, transmitted the petition in the House, and was submission of petition, peace, and judges, was submitted into the alleged wrongs, sometimes being the matter to the remedy of the ordinary law, and sometimes transmitting the petition to the Chancellor or the judges, or, if the common law seemed to redress, to parliament. However, and most of petitions are still appended by the House of Lords at the opening of every parliament, though such functions have long since been transferred to parliament itself. The earlier petitions were generally addressed to the House of Lords; the practice of presenting the House of Commons first became frequent in the reign of Henry IV.

Since the revolution of 1688, the practice has been gradually introduced of petitioning parliament, not so much for the redress of specific grievances, as regarding general questions of public policy. Petitions must be in proper form and respectful language, and there are cases where petitions to the House of Commons will only be received if recommended by the crown, as where an advance of public money, the relinquishment of debts due to the crown, the remission of duties payable by our people, or a change in the revenues of India have been prayed for. The same is the case with petitions praying for compensation for losses out of the public funds. A petition must, in ordinary cases, be presented by a member of the House to which it is addressed; but petitions from the corporation of London may be presented by the sheriff or lord mayor. Petitions from the corporation of Berlin have also been allowed to be presented by the lord mayor of that city, and it is believed that

a similar privilege would be accorded to the lord provost of Edinburgh.

The practice of the House of Lords is to allow a petition to be made the subject of a debate when it is presented; and unless a debate has arisen on it, no public notice is kept of its substance or the parties by whom it is signed. In the House of Commons, petitions not relating to matters of urgency are referred to the Committee on Public Petitions, and in certain cases ordered to be printed.

In 1827, there were presented to parliament 10,521 petitions with 2,285,865 signatures; in 1855, 24,389 petitions, with 2,299,075 signatures.

PETITION OF RIGHTS a declaration of certain rights and privileges of the subject obtained from King Charles I. in his first parliament. It was so called because the Commons stated their grievances in the form of a petition, refusing to accept the supplies till the prayer was granted. The petition professes to be a mere corroboration and explanation of the ancient constitution of the kingdom; and after reciting various abuses, recognising the rights contained in prayer: "that no man be compelled to make or yield any gift, loan, benevolence, tax, or such like charge, without common assent by act of parliament; that none be called upon to make assent be refused to make; that freedom be maintained or detained only by the law of the land, or by due process of law, and not by the King's special command, without any chance; that persons be not compelled to receive soldiers and domestics into their houses against the laws and customs of the nation; that commissions for proceeding by martial law be revoked." The king at first objected the petition, expressing in general terms his wish that rights should be done according to the laws, and that his subjects should have no reason to complain of wrong or oppression; but at length, on both Houses of Parliament meeting on a fuller number, he pronounced an unqualified assent in the usual form of words: "that petition be not denied," on the 24th of June 1628.

PETRA (Heb. *hazal*, both names signify 'Rock') was anciently the capital of the Nabatheans, and was situated in the "desert of Elam" in Northern Arabia about 72 miles north-east of Akabah—a town at the head of the Gulf of Akabah, an arm of the Red Sea. It occupied a narrow rocky valley overhung by mountains, the highest and most celebrated of which is Mount Haur, where Aaron, the first Hebrew high priest, died, and was thus in the very heart of the region hallowed by the forty years' wanderings of the Israelites. The aboriginal inhabitants were called *Hirai* ('Hirai is seven'). It was then conquered by the Elamites or Lameans (but it never became their capital); and, in the 3d or 4th c. B.C., it fell into the hands of the Nabatheans, an Arab tribe, who carried on a great transit-trade between the eastern and western parts of the world. It was finally subdued by the Romans in 105 A.D., and afterwards became the seat of a metropolis, but was destroyed by the Mohammedans, and for 1284 years its very site remained unknown to Europeans. In 1812, Burckhardt first entered the valley of ruins, and suggested that they were the remains of ancient Petra. Six years later, it was visited by Messrs Irby, Mangles, Banks, and Leigh, and in 1825 by M.M. Laborde and Lislet, and since then by numerous travellers and tourists to the East, as Bertratt, Porter, and Dean Stanley. Laborde's drawings give us a more vivid impression of the ruins of P. than any descriptions, however picturesque. These ruins stand in a small open irregular basin, about half a mile square, through which runs a brook, and are best approached

by an extraordinary chasm or ravine, called the *Sik*, narrowing as it proceeds till in some places the width is only 12 feet, while the rocky walls of red-sandstone tower to the height of 300 feet. Hardly a ray of light can pierce this gloomy gorge, yet it was once the highway to P., and the remains of an ancient pavement can be traced beneath the brilliant oleanders that now cover the pathway. All along the face of the rocky walls are

rows of cave-tombs, hewn out of the solid stone, and ornamented with façades. These are also numerous elsewhere. Originally, they were probably dwellings of the living, not of the dead—a supposition justified by an examination of their interior; but when the Nabathæans built the city proper in the little basin of the hills, they were in all likelihood abandoned, and then set apart as the family-sepulchres of those who had formerly been 'dwellers in the clefts of

Petra—Mount Seir.—From Laborde.

the rocks.' The principal ruins are—1. *El-Khuzneh* ('the Treasure-house'), believed by the natives to contain, buried somewhere in its sacred enclosure, the treasures of Pharaoh. It directly faces the mouth of the gorge we have described, and was the great temple of the Petraeans. 2. *The Theatre*, a magnificent building, capable of containing from 3000 to 4000 spectators. 3. *The Tomb with the Triple Range of Columns*. 4. *The Tomb with Latin Inscription*. 5. *The Deer or Convent*, a huge monolithic temple, hewn out of the side of a cliff, and facing Mount Hor. 6. *The Acropolis*. 7. *Kus Farón*, or Pharaoh's palace, the least incomplete ruin of Petra. Most of the architecture is Greek, but there are also examples of the influence of Egypt, pyramidal forms being not unknown.

PETRARCA, FRANCESCO, the first and greatest lyric poet of Italy, was the son of a Florentine notary named Petracco, who belonged to the same political faction as the poet Dante, and went into exile along with him and others in 1302. Petracco took up his residence at Arezzo, and here the future poet was born in the month of July 1304. His original name was Francesco di Petracco, which he subsequently changed to that by which he is now known. When P. was about eight years of age, his father removed to Avignon, where the papal court was then held; and here, and at the neighbouring town of Carpentras, the youth studied grammar, rhetoric, and dialectics. Contrary to his own inclination, but in compliance with the wish of his father, he spent seven years in the study of law at Montpellier and Bologna; but in 1326 his father

died, and P. now devoted himself partly to the gaieties of Avignon, and partly to classical studies, or rather to the study of the Latin classics, as it was only towards the end of his life that he attempted to master Greek. At this time, he ranked among his friends, the jurist Soranzo, John of Florence, the apostolic secretary, Jacopo Colonna, Bishop of Lombes in Gascony, and his brother, the Cardinal Giovanni, Azzo da Corregio, lord of Parma, and many other noble and learned personages. His illustrious admirers—among whom were emperors, popes, dukes, kings, and sovereign-dukes—obviously thought themselves honoured by their intimacy with the son of a poor notary, and some were even forward in proffering him their favour. But the great event in P.'s life (viewed in the light of its literary consequences) was his tenderly romantic and ultimately pure passion for Laura—the golden-haired, beautiful Frenchwoman. Some slight obscurity still hangs over his relation to this lady, but it is almost certain that she was no less a paragon of virtue than of loveliness. He met her on the 6th of April 1327 in the church of St Clara in Avignon, and at once and for ever fell deeply in love with her. The lady was then 19, and had been married for two years to a gentleman of Avignon, named Hugues de Sade. For ten years, P. lived near her in the papal city, and frequently met her at church, in society, at festivities, &c. He sung her beauty and his love in those sonnets whose mellifluous conceits ravished the ears of his contemporaries, and have not yet ceased to charm. Laura was not insensible to a worship, which made an

emperor (Charles IV.) had to be introduced to him, and so he allowed to look but fearfully; but the same to have kept the sac-pamantis just at a proper distance. Only once did he dare to make an arrival of his love in her presence, and then he was severely reproved. In 1382, E. withdrew from Avignon to the romantic valley of Narni, where he lived for some years, spending his time almost solely in literary pursuits. A most brilliant hunter visited him at Rome, in 1344, where, on Easter-day, he was crowned in the Capitol with the laurel wreath of the poet. The ceremonies which marked this occasion were a grotesque medley of pagan and Christian representations. P. was, however, as noted a scholar as he was a poet; and throughout his whole life he was occupied in the collection of Latin MSS., some copying down with his own hand (notable those, he travelled frequently throughout France, Germany, Italy, and Spain. His own Latin works were the first in modern times in which the language was classically written. The principal are his *Epistole*, consisting of letters to his numerous friends and acquaintances, and which rank as the best of his prose works; *De Lato Latine Historica*; *De Romanis antiquis Poetis*; *De Vita Solenne*; *Humanis Mores*; *De Libris*, &c. *De Venerabili*, &c. Besides his prose-works, P. wrote numerous sonnets in Latin verse, elegiacs and an epic poem called *Africa*, on the subject of the second Punic War. It was this last production which obtained for him the laurel wreath at Rome. P. may be mentioned, displayed little sobriety about the tale of his beautiful Italian verse, but least his hope of his name being remembered on his Latin poems, which, it has been said, are now only remembered by his name. In 1523 he finally left Avignon, and passed the remainder of his life in Italy—partly at Milan, where he spent nearly ten years, and partly at Parma, Mantua, Padua, Verona, Venice, and Rome. At last, in 1570, he removed to Avona, a little village pleasantly situated among the Euganean Hills, where he spent his closing years in hard scholarly work, much annoyed by enemies, troubled with epileptic fits, not overly rich, but serious in heart, and displaying in his life and correspondence a rational and beautiful poetry. He was twice dead in his library on the morning of the 24th July 1579, his head dropped on a book. P. was not only the legend his eyes in learning, but not only above many of his contemporaries and successors. His deepest astrology, and the childish mistakes in his theory, but on the other hand, he had no liking for the common scepticism of the modern world; and, in his *De vii Symplicis et Mathematicis* *Inventionibus*, he sharply attacked the unphilosophical speculations of those who had acquired a shallow free-thinking habit from the study of the Avian-Aristotelian school of writers, such as Averroes. P. looked on ecclesiasticism, but was contented with one or two inconsiderable business, and refused all offers of higher ecclesiastical appointment.—The Italian lyrics of P.—the best of which are the *Rime*, or *Canzoniere*, in honour of Laura—have done far more to perpetuate his name than all his other works. Of Italian prose, he has not left a line. The *Rime*, consisting of sonnets, canzoni, madrigals, were composed during a period of more than forty years; and the later ones—in which P.'s love for Laura long since has been long grave, appears purified from all earthly gross—have done as much to refine the Italian language as the *Divina Commedia* of Dante. Of his poems there have been printed more than 300 editions. The first is that of Venice, 1470; the most precious is that by Marsilio Ficino, Padua,

1519). Collected editions of his whole works have also been published (Basil, 1480, 1574, and 1580, &c.). His life has supplied many writers, among whom may be mentioned Bellincioni, Biondini, Tommasini, De la Cerda, De Mada, Trubianchi, Balocchi, and Ugo Foscolo.

PETREI, (*Pterodroma*), a genus of birds, sometimes ranked among *Gruce* by v. L., and sometimes constituted into a separate family. *Pterodroma*, which is now subdivided into several genera, and distinguished by having the bill hooked at the tip, the inferiority of the upper mandible being a hard nail, which appears as if it were articulated to the rest, the nostrils being like a tube which lies along the back of the upper mandible, and the hind toe merely rudimentary. They possess great power of wing, and are among the most directly winged of birds, being often seen at great distances from land. Among the *Pterodroma* are reckoned the following by v. L.: *Minicivora* (v. L.), and the small land-dwelling *Phaethon*, *Pterodroma*, *Phaethon*, and *Micropod* (v. L.). These form the genus *Pterodroma* of recent ornithological systems, the name (*Pter*, meaning wing) being given to them in allusion to their apparent running along the surface of the waves, which they do in a remarkable manner, and with great rapidity, particularly when the sea is stormy, and the madwaves and other animals forcing their head as brought in shore to the surface—now descending into the very depth of the hollow between two waves, now touching their highest buoyant crest, and rising about with perfect safety and apparent delight. Hence also their name *Pterod*, a derivative of *Pteris*, from the apostle Peter's walking on the water. From the frequency with which flocks of these birds are seen in stormy weather, or as heralds of a storm, they are very unfavourably recorded by sailors. They have very long and pointed wings, passing beyond the point of the tail; and the tail is square in some, slightly forked in others. Their flight much resembles that of a swallow. They are to be seen in the state of all parts of the world, but are more abundant in the southern than in the northern hemisphere. The names Storm P. and Mother Carey's Chicken are sometimes more particularly appropriated to *Phaethon*, a pelagic bird, scarcely larger than a lark, and the smallest web-footed bird known, of a sooty black colour, with a little white on the wings and some near the tail. Two or three other species are occasionally found on the British shores; but this is the most common, breeding in crevices of the rocks of the Scilly Isles, St Kilda, the Orkneys, Shetland Isles, &c. Like many others of the family, it generally has a quantity of oil in its stomach, which, when wounded or seized, it discharges by the mouth or nostrils; and of this the people of St Kilda take advantage, by seizing the birds during incubation, when they sit so closely as to allow themselves to be taken with the hand, and collecting the oil in a vessel.

PETRIFICATION, a name given to organic remains found in the strata of the earth, because they are generally more or less mineralized or made into stone. The word has fallen very much into disuse, having given place to the terms *Fossil* (q. v.) and *Organic Remains*.

PETROICA, a genus of birds of the family *Sylviidae*, natives of Australia, nearly allied to the *Reithroptera*, and to which its familiar name *Folios* has been given by the colonists. The song, call-note, and manners of *P. melanotis*, a species abundant in all the southern parts of Australia, very much resemble those of the European lark, but its plumage is very different; the male having the

head, throat, and back jet-black, the forehead snowy-white, one longitudinal and two oblique bands of white on the wings, and the breast bright scarlet; the female is brown, with red breast. There are several other species, birds of beautiful plumage.

PETROLEUM. See **NAPHTHA**. In consequence of the danger attending the storing and keeping of petroleum, an act of parliament was passed in 1861 (25 and 26 Vict. c. 66) to regulate the subject, putting it on a similar footing to gunpowder. A licence is required to keep large quantities, which is obtained in England from the aldermen of the city of London, the metropolitan board, the mayor and aldermen of boroughs, or the harbour commissioners, according to the locality where it is proposed to be kept; and in other places, in England and Scotland, from two justices of the peace. If the licence is refused, the party may appeal to the Home Secretary. Not more than forty gallons must be kept within fifty yards of a dwelling-house or a warehouse for goods, except in pursuance of a licence, under a penalty of £20 per day. One moiety of the penalty is given to the informer. A search-warrant may be obtained from justices, in case it is suspected that the act is violated.

PETROLOGY (Gr. science of rocks), a term recently introduced into geology to designate particular aspects of the study of rocks, apart from their organic contents. By some, it is confined to an examination of their structure and composition; by others, it is extended to the study of rock-masses, their planes of division, their forms, their position and mutual relations, and other characters not bearing on the question of the geological time of their production.

PETROMYZON. See **LAMPREY**.

PETRONEL, an ancient and clumsy description of pistol.

PETRONIUS, C., a Roman voluptuary at the court of Nero, whose profligacy is said to have been of the most superb and elegant description. We know, however, very little about him. He was at one time proconsul of Bithynia, was subsequently appointed consul, and is certified as having performed his official duties with energy and prudence. But his grand ambition was to shine as a court-exquisite. He was a kind of Roman *Brummell*, and Nero thought as highly of him as did the Prince Regent of the famous Beau. He was entrusted by his imperial master and companion with the charge of the royal entertainments, and thus obtained (according to Tacitus) the title of *Arbiter Elegantia*. Nero would not venture to pronounce anything *comme il faut*, until it had received the approval of the oracle of Roman fashion. The influence which he thus acquired was the cause of his ruin. Tigellinus, another favourite of Nero, conceived a hatred of P., brought false accusations against him, and succeeded in getting his whole household arrested. P. saw that his destruction was inevitable, and committed suicide (66 A.C.), but in a languid and graceful style, such, he thought, as became his life. He opened some veins, but every now and then applied bandages to them, and thus stopped the flow of blood, so that he was for a while enabled to gossip gaily with his friends, and even to appear in the streets of Cumæ before he died. We are told that he wrote, sealed, and despatched to Nero, a few hours before his death, a paper containing an account of the tyrant's crimes and flagitious deeds. It has been generally supposed that P. is the author of a well-known work entitled, in the oldest MSS., *Petronii Arbitri Satyricon*, a series of fragments belonging apparently

to a very extensive comic novel or romance (see **NOVELS**), the greater portion of which has perished, but there is really no satisfactory evidence to shew whether or not he was so. It is probable, however, that the work belongs to the 1st c. A.D. The fragments exhibit a horrible picture of the depravity of the times; but there is no indication that the author disapproves of what he describes. The *editio princeps* of the fragments appeared at Venice in 1499; later editions are those of Barmann (Traj. ad Rhen. 1709; 2d edit. Amst. 1743), and of Antonius (Leip. 1781).

PETROPALVOVSK, a small port of Russian Siberia, near the mouth of the river Avatcha, on the east coast of the peninsula of Kamchatka. Lat. 53° N., long. 158° 44' E. It has only 691 inhabitants, and has lost much of its former importance since its desertion by the Russians in 1855, and the removal of its garrison to Nikolaeval.

PETROZAVODSK, an important mining-town in the north of European Russia, capital of the government of Olonetz, stands on the western shore of Lake Onega, 300 miles by water north-east of St Petersburg. A cannon-foundry was erected here in 1701 by Peter the Great, who himself had discovered the rich resources of this northern region in iron and copper ores. The town itself dates from the year 1703; and from that to the present time, it has been the great centre of the mining industry of the government. The Alexandrovsky arm-factory is specially deserving of notice. It was founded in 1773, and, besides other arms, it has produced in all 30,000 pieces of cast-iron ordnance. Works are also fitted up for the preparation of steel. Wood abounds in the vicinity, and there is easy communication by water with St Petersburg. Pop. 10,648.

PETSH, or **IPEK** (i.e., silk), a town of European Turkey, in Albania, stands on the Bistriza, or White Drin, 65 miles north-east of Scutari. It is a pleasant town; the houses are large and handsome, and, as a rule, have gardens attached, in which fruit and mulberry-trees are cultivated. Water, from the river, is led up into all the houses. Silk is extensively made, tobacco and fruits are largely cultivated, and arms manufactured. P. was formerly the residence of the Servian patriarcha. Pop. 8000.

PETTY BAG OFFICE, one of the branches of the Court of Chancery, now regulated by statutes 11 and 12 Vict. c. 48, and 12 and 13 Vict. c. 108. The clerk of the petty bag, an officer appointed by the Master of the Rolls, draws up writs of summons to parliament, *Congès d'élire* for bishops, writs of *Scire facias*, and all original writs. A great deal of miscellaneous business is also transacted in the petty bag office, which the Lord Chancellor and Master of the Rolls are empowered to regulate and transfer from time to time. In the petty bag office may be brought any personal action by or against any officer of the Court of Chancery, in respect of his service or attendance.

PETTY OFFICERS in the royal navy are an upper class of seamen, analogous to the non-commissioned officers in the army. They comprise the men responsible for the proper care of the several portions of the ship, the foremen of artificers, the signalmen, and many others. They are divided into three classes: chief petty officers, at 2s. 3d. a day; 1st class working petty officers, at 2s. a day; and 2d class working petty officers, at 1s. 10d. a day. Petty officers are appointed and can be degraded by the captain of the ship. Her efficiency much depends on this useful class of sailors.

PETTY SESSIONS is the court constituted by two or more justices of the peace in England, when sitting in the administration of their ordinary jurisdiction. Though for many purposes statutes outside one justice to do acts auxiliary to the hearing and adjudication of a matter, yet the jurisdiction to adjudge is generally confined upon the justice or petty sessions, in which case there must be at least two justices present, and this is called a petty sessions, as distinguished from quarter sessions, which generally may entertain an appeal from petty sessions. For the purpose of securing always sufficient justice, the whole of the counties of England are subdivided into what are called petty sessionsal divisions, those justices who live in the immediate neighbourhood being the members who form the court of each division. This subdivision of counties is confirmed by statute, and the justices of quarter sessions have power from time to time to allow it. Each petty sessions is held in some town or village which gives it a name, and a police-court or place is appropriated for the purpose of the sittings of the court. There is a clerk of each petty session, usually a local attorney, who advises the justices and serves the summons, and receives the fees made payable for steps of the process. The justices in petty sessions have a multifarious jurisdiction, which they exercise chiefly by imposing penalties authorized by various acts of parliament, as penalties against poachers, vagrants, absconding workmen and apprentices, &c. They also have jurisdiction in some charges for all indictable offences; to take depositions of witnesses, and, if they think a case of importance is made out, to commit the party for trial at the quarter sessions or assizes, and to bind over the witnesses to attend. See also *JURORS OF THE PEACE*.

PETUNIA, a genus of plants of the natural order Solanaceæ, natives of the warmer parts of America. They are herbaceous plants, very nearly allied to Tobacco, and with a certain similarity to it in the general appearance of the foliage, which has also a slight viscosity, and emits when handled a disagreeable smell, but the flowers are very beautiful and variously improved by cultivation are amongst the favourite ornaments of our greenhouses and flower-borders. The petunias, although perennial, are very often treated as annuals, sown on a bed in spring, and planted out in summer, in which way they succeed very well even in Scotland. They are tall plants, with branching weak stems, and may readily be made to cover a trellis. Although, when treated as greenhouse plants, they become full shrubby, they do not live more than two or three years. The name *P.* is from the Brazilian *Pana*. The first *P.* was introduced into Britain in 1659.

PETUNTKI, a white earth used by the Chinese in the manufacture of porcelain, and said to consist of uncombined but uncombined feldspar. It is white, and is used for glazing porcelain.

PETWORTH, or BUCKING MARBLE, is a thin layer of limestone, composed of the shells of freshwater Bivalves. It has been long, but not extensively used for ornamental purposes. A polished slab of it was used in a Roman building at Chichester, and pillars formed of it exist in the cathedrals of Winchester and Canterbury.

PEWES familiarly *puys*. Old Fr. *pays*; Dutch, *peus*; Low German, 'anything on which to lean.' *Pewery*, *peewery*, *peewery* made in churches. Churches were in use in England some time before the Reformation, as is proved by numerous examples still existing, the carving on some of which is as early as the Merovingian Period, i. e., before 1400 A.D.;

and records as old as 1420, speak of such seats by the name of *pews*. They were originally plain fixed benches, all facing east, with partitions of wainscoting about three feet high, and sides of the width of the seat, pencilled or carved; the sides sometimes rising above the wainscoting, and ending in finials or pinnacles, or also ending with it and finished with a moulding. After the Reformation, *pewes* under the influence of the Puritans, who, objecting to some parts of the service which they were compelled to attend, sought means to conceal their inconstancy, *pews* grew into large and high enclosures, containing two or four seats, lined with velvet, and fitted with down, cushions and cushions. *Pews* were early assigned to particular persons, but at first only to the patrons of churches. A canon made at Ely, in 1277, relates quarrelling for a seat in church, and declares that none shall claim a seat as his own except noblemen and the patrons. Gradually, however, the system of appropriation was extended to other inhabitants of the parish, to the injury of the poor, and the multiplication of disputes.

The law of *pews* in England is briefly this. All church-seats are at the disposal of the bishop, and may be assigned by him, either (1) directly by deed to the holders of any property in the parish; or (2) through the churchwardens, whom duty it is, as officers under the bishop, to 'seat the parishioners according to their degree.' In the former case, the right descends with the property, if the faculty can be shown, or immemorial possession proved. In the latter, the right can at any time be recalled, and lapses on the party seeking to be a regular occupant of the seat. It appears that by common law every parishioner has a right to a seat in the church, and the churchwardens are bound to place each one as best they can. The practice of letting *pews*, except under the church-building acts, or special local acts of parliament, and, much more, of *selling* them, has been declared illegal.

In Scotland, *pews* in the parish churches are assigned by the heritors (i. e., v.) to the parishioners, who have accordingly the preferable claim on them; but when not so occupied, they are legally open to all. As is well known, *pews* in dissenting churches are rented as a means of revenue to maintain general charges. In some parts of the United States, *pews* in churches are a matter of annual competition, and bring large sums. Lately, in England, there has been some discussion as to the rigorously exclusive character of the 'pew system,' and a disposition has been manifested to abolish *pews* altogether, and substitute movable seats available by all indiscriminately. Several pamphlets have appeared on the subject. In the Roman Catholic churches on the Continent *pews* are seldom to be seen.

PEWTER, a common and very useful alloy of the metals tin and lead. Two other kinds of pewter have a more compound character. Common, or *peewter*, consists of 4 parts of tin and 1 part of lead; *plate-pewter* is made of 100 parts of tin, 8 parts of antimony, 2 parts each of bismuth and copper; another kind, called *trifle*, is composed of 83 parts of tin and 17 parts of antimony. Although these are the standard formulae, each kind is often much varied to suit the purposes of the manufacturer; the chief alteration being the addition of a large proportion of lead to the last, and a large increase of the same metal in the other two.

PÉZENAS, a manufacturing town of France, in the department of Doubs, on the left bank of the river of that name, 25 miles west-south-west of Moulignon. It stands in a district remarkable for its beauty, and so well cultivated as to have received

the name of the Garden of Herault. It is famous for its healthy climate and clear sky. The vicinity produces excellent wine, and woollen and linen goods are manufactured. The trade, however, is chiefly in liquors, and P. is known as one of the principal brandy-markets of Europe. Pop. 6609.

PFEFFERS an extraordinary and much-visited locality in the Canton of St Gall, Switzerland, five miles south-east of Sargans. It has been famous since the middle of the 11th c. for its hot baths, situated 2180 feet above sea-level, and 520 feet above the village of Ragatz. The old baths of P. are built on a ledge of rock a few feet above the roaring torrent of the Tamina, and are hemmed in by walls of rock towering above them to the height of 600 feet, and so far burying the baths within the gorge, that even in the height of summer, sunlight appears above them only from ten to four. Above the old baths, the walls of the ravine of the Tamina contract until they meet, covering up the river, which is there seen from a cavernous gap. The hot-springs are reached from the baths by means of a railed platform. This platform, leading to the hot spring, is secured to the rocks, and the Tamina churns its way through the cleft 30 or 40 feet below. The waters of the hot spring are now conveyed to Ragatz (about two miles below P.) by wooden pipes, 12,500 feet long. The waters, as they issue from the spring, have a temperature of 100° Fahr. A pint of the water, which is used both for drinking and bathing, contains only about three grains of saline particles.

PFEIFFER, IDA (*née REYER*), a celebrated female traveller, was born at Vienna, October 15, 1797, and from her earliest years shewed a resolute and fearless, but not unfeminine disposition. In 1820, she married an advocate, named Pfeiffer, from whom she was obliged to obtain a separation, after she had borne him two sons, Oscar and Alfred, whose education devolved on herself. When she had settled them in life, and was free to act as she pleased, she at once proceeded to gratify, at the age of 45, her long-cherished inclination for a life of travel and adventure. Her first expedition was to the Holy Land. She left Vienna in March 1842, and returned in December of the same year, having traversed, alone and without guide, European and Asiatic Turkey, Palestine, and Egypt. She published an account of her eastern rambles in the following year (*Reise einer Wienerin in das Heilige Land*), which, like all her other works, has gone through many editions, and been translated into French and English. In 1845, she visited Northern Europe—Sweden, Norway, Lapland, and Iceland—and recorded her impressions in her *Reise nach dem Skandinavisch, Norden und der Insel Island* (2 vols. 1846). But these journeys, which would have satisfied most women, were but little excursions in the eyes of this insatiable nomade, and only served to whet her appetite for something vaster. She resolved on a voyage round the world; and on the 23rd of June 1846, sailed from Hamburg in a Danish brig for Brazil. Her descriptions of the scenery of that country and of the inhabitants—both native Indians and Brazilians—are exceedingly interesting. She then sailed round Cape Horn to Chile, and thence, after some time, across the Pacific to Otaheite, China, and Calcutta; crossed the Indian peninsula to Bombay, whence she took ship for the Persian Gulf, landed at Bassora, traversed a great part of Western Asia, Southern Russia, and Greece, and re-entered Vienna, November 4, 1848. Two years later, she published a narrative of her travels and adventures, entitled *Eine Frauenfahrt um die Welt* (Vienna, 1850, 3 vols.). As a small recognition

of her services, and of the singular energy, fortitude, and perseverance of her character, the Austrian government granted Madame P. a sum of £100. She now determined to go round the world again, but by a different route. Proceeding to England, she, in May 1851, took ship for Sarawak, rounding the Cape of Good Hope, penetrated alone to the heart of Borneo, visited Java and Sumatra, lived for a time with some cannibal tribes, and sailed from the Moluccas to California, thence to Peru, scaled the peaks of Chimborazo and Cotopaxi, made a run through the principal of the United States, and returned to London in 1854. This second voyage, signalled by several scientific observations, is described in *Meine Zweite Weltreise* (Vien. 1856). But the more she travelled, the fiercer became her hunger for movement. In September 1856, she set out on what was to be her last expedition—namely, to Madagascar. After enduring terrible hardships, she got away, and came home to Vienna—to die. Her death took place October 28, 1859.

PFORZHEIM, an important manufacturing town of the Grand Duchy of Baden, on the northern border of the Black Forest, stands on the Eus, at its confluence with the Nagold and Wurm, 55 miles south-south-east of Mannheim, and on a recently-constructed branch of the Mannheim and Bale Railway. It consists of the town proper—surrounded with a wall and ditch—and the suburbs; contains the remains of an ancient castle, formerly the residence of the Markgrafs of Baden-Durlach; several churches, one of which, the *Schlosskirche*, on a height, contains a number of monuments, with marble statues of the princes of Baden; a convent for noble ladies; industrial and other schools; chemical and iron-works; machine-shops, tanneries, and cloth and other factories. The principal articles of manufacture are gold and silver wares and trinkets, the chief markets for which are Germany and America. An important trade is carried on in timber, which is cut in the neighbouring forests, and is floated down to Holland by the Neckar and Rhine. Pop. of town and suburbs, about 9000.

PHÆDRUS, a Latin poet, whose works consist of fables. He was probably a Thracian or Macedonian, carried to Rome as a slave in his childhood, and brought up at the court of Augustus, who emancipated him. Under Tiberius, he was exposed to great danger from the hostility of Sejanus, but lived to see that general's overthrow, and died at an advanced age, probably in the reign of Claudius. Five books of fables, after the manner of Æsop, and called *Fabulæ Æsopice*, have been usually ascribed to him. The faults of the style have led, however, to the suspicion, not merely of alterations at a later date, but of later, and even much later, composition. The dry 'morals' have been supposed to indicate the Middle Ages as the period to which the work should probably be referred; but its authenticity is generally admitted. The first edition was published at Troyes in 1596. The text has subsequently occupied the attention of some of the greatest scholars and critics, from the days of Burmann and Bentley to the present time. A sixth book, containing 32 fables, has recently been discovered and published, of the authenticity of which, however, there are greater doubts than of that of the other books. The best edition is that of J. C. Orelli (Zürich, 1831).

PHÆNOGAMOUS PLANTS. See **PHANEROGAMOUS PLANTS**.

PHAËTHON (i.e., the shining), in the writings of Homer and Hesiod, a frequent title of Helios the sun-god, and subsequently employed as his name.—P., in Greek mythology, is also the name of a son of

His son, famous for his unfortunate attempt to drive his father's chariot, narrowly had the presumption on which seized the reins, when the horses, perceiving his weakness, ran off, and approaching too near the Earth, almost set it on fire. Whereupon the Earth cried to Jupiter for help, and Jupiter struck down P. with a thunderbolt into the embraces of Proserpine, the Goddess, who had disguised the horses of the Sun, were changed into poplars, and their mane into aspen.

PHALANX. See TONGUE BIRD.

PHALANGINA (Gr., from *phalaia*, to eat or swallow, designates a variety of ulceration, in which there is much inflammation, and at the same time rapid dissection of the affected part. The sore presents an irregular outline, and a yellowish centre; it gives off a profuse bloody or ichorous discharge, and is extremely painful. It usually attacks persons whose constitutions are vitiated by venereal, by the syphilitic virus, by the abuse of mercury, by intemperance, &c. It not very infrequently appears in the throat after scarification in a cancer form. It is not so affected by the internal administration of opium (to allay the pain), and of quinine, or some other preparation of bark, opium, iodine, &c. to improve the tone of the constitution, together with nutritious and sedative local applications, recourse must be had to the destruction of the part by strong nitric acid, or some other caustic.

The terrible disease known in civil practice as **PHALANX** (Gr.), and in military and naval practice as **HOSPITAL FEVER**, is, exactly, according to some of our highest medical authorities, a state of phlegmon in its fullest development. This disease occurs for its development the influence of some of those miasmatic causes which regulate the outbreak of epidemic, and is peculiarly characterized by its contagious and infectious nature. It is usually accompanied by the preponderance of sick and wounded men, and some idea of its violence may be formed from the fact that on the return of the French fleet from the Egyptian war, no less than 20 deaths from it occurred in one ship in the course of 28 hours. It is not of frequent occurrence in the London Hospital, but it broke out in the Middlesex Hospital in 1833, in University College Hospital in 1844, and in St. Bartholomew's and St. George's Hospitals in 1847 (Dr. Williams's *Principles of Medicine*, vol. ii, p. 74, note). For details respecting this disorder the reader is referred to Hennen's *Principles of Military Surgery*, Baggie's *On Hospital Diseases*, and the article on 'Fever,' by Mr. Holmes in Holmes's *System of Surgery*, vol. i.

PHALACHOCORAX. See CHORUS.

PHALANX. See MINE.

PHALANGER or **PHALANGIST** (*Phalanger*), a genus of marsupial quadrupeds, having a rather short head, short ears, short woolly fur, a long prehensile tail, sometimes completely covered with hair, and sometimes only at the base, and only towards the extremity; the dentition somewhat various as to the number of premaxillars, the incisors always six in the upper jaw and two in the lower, the two molars eight in each jaw, the canines of the lower jaw very small, and close to the molars. The fore-paws are strong, and capable of much use in grasping food and bringing it to the mouth. A number of species inhabit Australia and the islands to the north of it. They live chiefly in trees, and feed on insects, small animals of various kinds, eggs, and fruits. The *Small P.* or *TARA* (*P. velutinus*) is pretty common in Van Diemen's Land, and is much sought after on account of its fur, which is of a uniform smoky-black colour, or lined with chestnut, warm and beautiful. The tail

is very bushy. It is nocturnal in its habits. The *Yellow P.* (*P. setiger*), also called the *Yellow Kangaroo*, is very plentiful and widely diffused in Australia. The length of the animal from the point of the snout to the root of the tail is about 20 inches; the tail is about 15 inches long, and bushy; the colour is grayish-yellow on the upper

Vulpine Phalanger (*P. vulpinus*).

parts and lower half below. The fur is not so much refined as that of the last species, but is used for various purposes. The flesh, although it has a strong peculiar flavour, is a favourite food of the Australian aborigines. Nearly allied to this genus is the genus *Urocyon*, of which one species, whitish-gray, spotted with brown, is plentiful in the Moluccas and Papuan Islands. Allied to the phalangers also are the *Flying Phalangers* (p. 74).

PHALANODONTES, family of Trachonitid Amphipoda, popularly called *Harlequin*, some of the species appearing in great numbers in fields during the hay and corn harvests. They resemble spiders in their general form, although their organs of respiration are very different. Their legs are extremely long and slender. Most of the species are very agile.

PHALANSTERRIANISM (from Gr., signifying phalanx and solid), the system of living in communities called phalansteries, as suggested by Fourier, the French socialist. See FORTIFICATION.

PHALANX, the ancient Greek formation for heavy infantry, which won for itself a reputation of inviolability, may be described as a line of parallel columns, rendered by its depth and solidity capable of penetrating any line of troops. The oldest phalanx was the Macedonian or Spartan, in which the soldiers stood eight deep; the Athenian phalanx had been the same, until, at the battle of Marathon, (490 B.C.) Miltiades reduced the depth to four men in order to increase his front. When Epaminondas organized the Theban army against Sparta, he felt that the Spartan line of battle would be impregnable in troops organized in their own manner. He therefore increased the depth and formed the front of his phalanx, which enabled him to burst through the Spartan line, inflicting the magnanimous defeat of Leuctra (371 B.C.). Philip of Macedon had learned the art of war under Epaminondas, and when he resolved to make his name a military power, he formed the celebrated Macedonian phalanx (353 B.C.), which enabled him to conquer Greece, and with which his son Alexander subdued the eastern world. The Macedonian phalanx, as the latest form that organization assumed, and as the shape in which the phalanx encountered the

PHALARIS—PHALLUS.

military skill of the west, is deserving of description. The line was 16 deep: a grand-phalanx comprising 16,384 *hoplites*, or heavy-armed soldiers, subdivided as follows: the grand-phalanx was composed of four phalanxes or divisions, each under a general officer, called a *phalangarch*; his command was divided into two brigades or *merarchies* (sometimes called *telarchies*), each of these comprising two regiments, or *chiliarchies*, of four battalions or *syntagma* each. A *syntagma* answered accurately to a modern battalion, except that it was smaller. It was a perfect square, with 16 men each way, was commanded by a *syntagmarch* or *xenagos*; and had an adjutant, with one or two other staff-officers who stood behind. Eight files united were under a *taxiarch*, four under a *tetrarch*, corresponding probably to a modern captain, two files were under a *dilochite* or subaltern. A single file of 16 men was called a *lochos*, and the best man was placed at its head; a picked man, the *ouragos*, also marching in the rear. The arms of all these phalanx-men were pikes or spears, 24 feet long, of which 6 feet were behind and 18 feet held in front of the combatant. As each man occupied with his shield three feet, the phalanx, when it advanced, had six tiers of spear-points in front, a wall of steel which no troops could withstand, especially as the bearers of the spears were pressed on by the ten ranks in their rear. By rapid movements the phalanx could change front, form in close column of *syntagma*, and execute other critical manœuvres. —The heavy-armed phalanx was ordinarily flanked by *pillastes* or light infantry, similarly formed, but only eight deep, while the cavalry were but four deep. The phalanx, as representative of the heavy formation, came in contact with the lighter legion of Rome during the wars of Pyrrhus in Italy. —At the great battle of Heraclea (279 B.C.), the phalanx won the day; but the victory was attributable to other causes as much as to any superiority of formation.

PHA'LARIS, a tyrant of Agrigentum in Sicily, who flourished about the middle of the 6th c. B.C. According to the prevalent tradition, he was infamous for his cruelty. He maintained his power for 16 years by the aid of foreign hirelings, and, it is said, by putting to death all persons of eminence in his dominions; but at last he fell a victim to popular indignation. He gratified, we are told, his love of cruelty by causing persons to be roasted alive in a brazen bull, which was made for that purpose—the first victim being the maker, Perillus. Cicero calls him the 'most cruel of all tyrants' (*crudelissimus omnium tyrannorum*). But some doubt attaches to this view of his character, partly because many of the crimes laid to his charge are intrinsically improbable, and partly because later traditions represent him as fond of literature and philosophy, and a patron of learned men. Lucian affirms that he was naturally a man of a mild and humane disposition. How far the later view should be allowed to modify the earlier, it is—in the absence of all reliable knowledge—impossible to say. It is under the later aspect that he is shewn to us in the famous but spurious *Epistles of Phalaris*. See BENTLEY.

PHA'LAROPÉ (*Phalaropus*), a genus of birds of the family *Lobipedidae* (q. v.); having a rather long, slender, weak, straight bill, resembling that of the sandpipers, which, indeed, they otherwise much resemble, although differing in their aquatic habits; the greater part of their time being passed in swimming on the sea, where they seek molluscs and other small marine animals for their food. The GRAY P. (*P. lobatus*), although formerly so rare a bird in Britain that Pennant says he only knew of two instances of its occurrence in his time, is now

not unfrequently seen in its autumn migration from its northern abode to its southern winter-quarters. It breeds in the Arctic regions both of the old and new world, migrating southward in both on the approach of winter. Its entire length is rather more than eight inches. The tail is short. It is a beautiful bird, and remarkable for the great difference of its summer and winter plumage, the prevailing tint in winter being a delicate gray, whilst in summer

Gray Phalarope (*P. lobatus*).

the upper parts exhibit a fine mixture of black, white, and yellow, and the breast and under parts are reddish chestnut.—The RED-NECKED P. (*P. hyperboreus*, or *Lobipes hyperboreus*, a generic distinction being made by Cuvier and others, on account of the sharper and more slender bill), breeds in some of the northern Scottish islands, although it is more common in more northern regions, and, like the former, is found in all the northern parts of the world. It is rather smaller than the Gray P., and is, like it, very graceful in form and movements, and finely coloured. The phalaropes are very fearless of man, and very easily tamed. Their flesh is oily and unpalatable.

PHA'LLUS, a representation of the male generative organs, used at certain Dionysian festivals in ancient Greece, as a symbol of the powers of procreation. It was an object of common worship throughout the nature-religion of the East, and was called by manifold names, such as *Linga* (q. v.), *Joni*, *Pollear*, &c. Originally, it had no other meaning than the allegorical one of that mysterious union between the male and female, which throughout nature seems to be the sole condition of the continuation of the existence of animated beings; but at a later period, more particularly when ancient Rome had become the hot-bed of all natural and unnatural vices, its worship became an intolerable nuisance, and was put down by the senate on account of the more than usual immorality to which it gave rise. Its origin has given rise to much speculation, but no certainty has been arrived at by investigators. The Phœnicians traced its introduction into their worship to Adonis, the Egyptians to Osiris, the Phrygians to Attys, the Greeks to Dionysus. The common myth concerning it was the story of some god deprived of his powers of generation—an allusion to the sun, which in autumn loses its fructifying influence. The procession in which it was carried about was called *Phallagogia*, or *Periphalia*, and a certain hymn was sung on that occasion, called the *Phallikon Melos*. The bearers of the phallus, which generally consisted of red leather, and was attached to an enormous pole, were the *Phallophoroi*. Phalli were on those occasions worn as ornaments round the neck, or attached to the

body. Aristotle traces the origin of comedy to the phylly and the imperfect jokes customary on these festivals. Phallus were often attached to staves, and of a prodigious size; sometimes they were even movable. At a procession at Phoenicia Phallophoria, a phallus was carried about made of gold and 129 yards long. Before the temple of Venus at Hierapolis there stood two phalli, 120 feet high upon which a priest mounted annually, and remained there in prayer for seven days. The phallus was an attribute of Pan, Priapus, and in a certain extent also of Heros.

PHALLUS, a genus of fungi of the division *Ascomycetes*, sub-division, the order covering at length becoming to permit the growth of a stem, the receptacle which produces the spores, and which is surrounded by a rudimentary system. The most common British species, *P. repens* or *fuliginosus*, popularly called *Kinkhorra*, is as large as a hen's egg, growing underground in bladders, and finally sending up a stem 4–10 inches high, the total smell of which is felt for many yards around. The stem is full of a jelly-like substance. The growth of the stem is very rapid, and it soon decays.

PHANEROGAMOUS (Gr. *phaneros*, manifest; *game*, covered), **PLANTS**, or **PHANOGAMOUS** (Gr. *phanos*, to show) **PLANTS**, are those plants which have true flowers, and in which the sexual organs (stamens and pistils) are distinctly visible. They are also called **FLOWERING PLANTS**, being by all these names contradistinguished to *Cryptogamous Plants* (q.v.). The seeds of *P. P.* originate from Ovules (q.v.), and already contain the young plant, more or less perfectly formed, which is called the embryo. *P. P.* are about three-fourths of all known plants. Among them are included all the larger flowers, and all plants of great importance in an economic point of view. They are generally divided into *Monoembryonous* or *Eudicots*, *Polycots*, and *Dicotyledonous* or *Euphorbia* *Plants*.

PHYRAON. The name given by the Hebrews to the monarchs ruling in Egypt at the time, in the same manner as Cesar was applied to the Roman emperors, and as Khan is to the Tartar and Shah to the Persian rulers. The word is of uncertain derivation, being capable of two derivations—viz., either *Pharaoh*, 'the lion,' which is the leading or best title of all Egyptian monarchs, or the popular expression, *Pharaoh*, or *Pharaoh*, 'the King.' It is even possible to derive it from *Pharaoh*, 'the lion,' another title of Egyptian monarchs. The greatest difficulties have been encountered in attempting to determine the particular monarchs who pass under this name in the Scriptures. The best mentioned is it in the case in whose reign Abraham visited Egypt, who is supposed by some chronologists to have been one of the Shepherd Monarchs, but nothing can be offered beyond mere conjecture in support of this theory. Another *P.* is the one in whose reign Joseph was brought to Egypt, and who was supposed by Manetho to be Apophis, one of the later Shepherd Kings of the seventeenth dynasty, who are known from the monuments to have immediately preceded the eighteenth. Dureau would place the arrival of Joseph in the reign of Osorkon, or, as he reads his name, Sesortosis I. of the 19th dynasty, in which indeed a famine is stated in the hieroglyphical texts to have happened, and in which it appears numerous officers were established to take charge of the grain. Arguments, however, may be adduced for Joseph having arrived in the time of the 12th dynasty, from the fact of the establishment of the family of Jacob in the land of Goshen, the importance to which Joseph had come, and the mention of the name of any of the

principal Egyptian cities in the narrative, and the fact of Joseph having married Asenath, the daughter of Potiphar, priest of Heliopolis, a city evidently the seat of the court under the 12th dynasty, as Onas or Ayas was under the Shepherd Kings. Great difficulty is experienced in determining the *P.* who reduced the Israelites to bondage, employed them in the labour of the brick-field, and compelled them to build the immensity of Pabon and Ramses. He appears to have motivated the total absorption of the Hebrews into the Egyptian race. All that is clear from the narrative is that the city of Ramses was called after his name, in the same manner as modern forts have been by contemporary rulers. Now frequent inscriptions occur in the Pyramid and other texts of the *Mastaba* or *Ramses*, or *Tower of Ramses II.*, which is represented on the walls of Medinet-Hab, and this has induced Lepsius and Brugsch to suppose the date of the Exodus from 1491 B.C. to the close of the nineteenth dynasty, or after Ramses II., a point controverted by other chronologists, who wish to place it to the middle of the 18th dynasty, or 1732 B.C. To give chronology the correct date, Lepsius takes the tablet of date of 1914 B.C. for the Exodus, or 1349 B.C. for the birth of Moses. The *P.* of the Exodus is supposed to be Merneptah or Menephthah, the son and successor of Ramses II. Philologically, this explanation is preferable, as the first point in the inquiry is the name of the Misdad of Ramses found both in the Hieroglyphs and on the monuments of Egypt. Other Pharaohs are mentioned as the father of Tefnefer, wife of Hahad and mother of Hensheh, the *P.* whose daughter Sotemah married; *P. Nebsa*, or *Nesheh II.*, who gave battle to Josiah, king of Judah, whom he slew at Megiddo, and who made war against the Syrians, defeated them at Megiddo, and took Gadytes or Kadesh, on the *Aravah* or *Orontes*. He was subsequently defeated by Nebuchadnezzar at Carchemish, 607 B.C. *P. Hophra*, was the Lophra or Apries of the Greeks, whose destruction was prophesied by Jeremiah, and who was strangled 529 B.C.—Brugsch, *Egyptische Stoffe*, iii. p. 109; Lepsius, *Einheit*, p. 337; Naue, *The Pharaoh of the Exodus* (5vo, Lond. 1862).

PHARISES (*Pharisei* or *Pharisai*, Samaritan; a so-called 'Jewish sect,' more correctly, however, a certain Jewish school, which probably dates as a distinct body or party from the time of the Syrian troubles, and whose chief tendency it was to resist all foreign, chiefly Greek, influences that threatened to undermine the sacred religion of their fathers. They most emphatically took their stand upon the Law, together with those influences drawn from its written letter which had, partly from time immemorial, been current as a sacred tradition, among the people. Out of the small band of the *Chasidim* (q.v.), the *P.* had taken their rise originally as *Chasidim*, Friends, Colleagues, Scholars—in entire distinction to the *Am-Ha-Aretz*, or common people—and their chief object in life was the Divine Law, its study and further development. Principally distinguished by their most scrupulous observance of certain ordinances relating to things clean and unclean, they further adopted among themselves various degrees of purity, the highest of which, however, was scarcely ever reached by any member of their community. For every degree, a special course of instruction, a solemn initiation, and a novitiate was necessary; all of which, together with a certain distinction in dress, seems to have been initiated from them by the *Tannaim* (q.v.). The name of *P.* or *Chasidim* was probably at first bestowed upon them in derision by the Sadducees or Zelotes, the priestly aristocracy and their party, the *Patriarchs*, who differed from them politically,

PHARISEES.

and to some extent also in religious matters. The P. had no special 'Confession of Faith,' or articles of creed different from the whole body of Jews. The Bible, as interpreted by the traditional Law, was their only code. Obedience to this Law, strictest observance of all religious and moral duties, submission to the Divine will, full confidence in the wisdom and justice of Providence, firm belief in future reward and punishment, chastity, meekness, and forbearance—these were the doctrines inculcated in their schools. They were, in fact, nothing more or less than the educated part of the people, who saw in the rigid adherence to the ancient religion, such as it had developed itself in the course of centuries, the only means of saving and preserving the commonwealth, notwithstanding all its internal and external troubles. Hence, they wished the public affairs, the state and all its political doings, to be directed and measured by the standard of this same Divine Law; without any regard for those aristocratic families who ruled, or at all events greatly influenced the commonwealth. These consisted of the priestly families, the Zadokites (Sadducees, q. v.), and of the valiant heroes and sagacious statesmen, who had brought the Syrian wars to a successful issue, and had, by prudent negotiations with other courts, restored the nation to its former greatness, and, on their own part, had acquired wealth and fame, and freer and wider views of life and religion. The latter held the modern doctrine, that religion and state were two totally different things; that God had given man the power of taking his matters into his own hands; and that it was foolish to wait for a supernatural interference, where energy and will were all that was required. Naturally enough, the political difference between the two parties by degrees grew into a religious one, since the Jewish State was one still completely pervaded by the religious element—as indeed it had begun as a theocracy, and could still, to a certain extent, be called by that name. And the more the Sadducees lost their influence—the people siding with the P.—the more the religious gulf must have widened between them; although the divergence between them, as far as our authorities—Josephus, the New Testament, and the Talmud—go, does not seem to have been of a very grave nature. Thus, the P. assumed the dogma of immortality, chiefly with a view to a future reward of good and evil deeds in this world; while the Sadducees, without rejecting—as we are erroneously informed by Josephus—this dogma in the least, yet held that there was nothing in the Scripture to warrant it, and, above all, that there was no need of any future reward; at any rate, that a pious life with a view to this was not meritorious. While the P. held all the traditional ordinances in equal reverence with the Mosaic ones, tracing, in fact, most of the former to Sinai itself, the Sadducees rejected, or rather varied some of these according to the traditions of their own families: these ordinances chiefly relating to priestly and sacrificial observances, certain laws of purity, and some parts of the civil law. It may perhaps even be assumed, with the most recent investigators (chiefly Geiger), that the P. were the representatives of a newer Halacha, dictated by an oppositional and religious and national zeal which carried them far beyond the original boundaries. Certain other legal differences between the two parties, such as the application of the laws of inheritance to daughters, or of the responsibility of the master for his servants, are nothing more than political party-views in a religious mask, which were meant to meet certain special isolated cases only. In general, the P. handled justice in a

much milder manner than their antagonists, who took their stand upon the rigid letter, and would hear of no mercy where a violation of the code was clearly made out. Out of the midst of the P. rose the great doctors and masters of the Law (*Soferim*, Scribes, *Nomodilaskaloi*, teachers of the Law), and to them were intrusted by the later rulers the most important offices.

Until recently, the greatest misconception has prevailed even among scholars respecting this self-sacrificing, patriotic, pious, learned, and national party of progress. That there were among them those who were a disgrace to any party, and, still more, to their strict one, no one knew better than the P. themselves, and in bitter words than were ever used by Christ and the apostles, the Talmud castigates certain hyperpious members of their own community as the 'plague of Pharisaism.' These hypocrites were characteristically styled *Zebuim* [dyed, painted ones], 'who do evil deeds like Zimri, and require a godly reward like Phinehas.' Seven kinds of P. are enumerated in the Talmud, six of whom were not to be counted as real Pharisees—viz. (1) they who did the will of God for earthly motives; (2) those who made very small steps, or said: Wait for me—I have still some good deed to do; (3) those who knocked their heads against walls, lest they might look at a woman; (4) *ex officio* Saints; (5) those who say: tell me of another duty; (6) those who are pious, because they fear God. The only genuine Pharisee was he 'who did the will of his Father in Heaven, because he loved Him.' Josephus's accounts, distortions in themselves, have, to add to the confusion, been misunderstood (thus, for example, the word which he uses to designate the three parties, never meant 'sect,' as it has invariably been interpreted); and the position of Christ, in relation to the P., can never be understood properly without a full acquaintance with the circumstances of the time, to which there is no other way than a knowledge of that literature (the Talmud and Midrash) which has so long been neglected. Christ found the influence of the P. predominant among the people, although the Sadducees (and the Boethusians) were in reality the ruling classes and allies of the reigning dynasty. He naturally sided with the democratic party of the P. against that of the proud opposite camp. As for the religious tendencies of the latter, the Sadducees (q. v.)—the people had decided that point already practically, by siding with the Pharisees. Once only an allusion is made also to the heaven of Herod = the Sadducees (Mark viii. 15. cf. Matt. xvi. 6). But it was, above all things, necessary to combat the ever-growing tendency to choke up, as it were, all real piety and genuine virtue of heart under external ceremonies and observances, which, unless guarded against, will appear, instead of a mere symbol and memento, the essence of religion itself, and thus become in time a delusion and bondage, and end in that vile hypocrisy, against which the Talmud fights with all its powers of derision, and Christ inveighs in much more vehement terms than is his wont. It was not in themselves that these 'oral laws' were held up to scorn. They were a necessary and natural growth, and acted, in the main, beneficially; as is now fully recognised by scholars of eminence. (For some further remarks on the subject, see TALMUD.)

Pharisaism—from which gradually branched off the wild democratical party of *Zealots* (Kannaim), and which for the last time represented political opinions in the revolution of Bar Cochba—has, from the downfall of the sanctuary, and the final destruction of the commonwealth to this day, remained the

general representative of Justice as a creed only, notwithstanding crying out, on all occasions, protesting only and not, words plain as Nations, *The Journal Says, Nonsense*.

PHARMACOPŒIA. This term has been applied in various works, consisting for the most part of (1) a list of the articles of the *Materia Medica*, whether simple or compound, with their characters, and the tests for the determination of their purity; and (2) a collection of approved receipts or prescriptions, together with the processes for articles in the *Materia Medica* obtained by chemical operations. Almost every civilized country of importance has its national pharmacopœia, amongst which those of the United States, France, and Prussia occupy specially honorable notice. The first pharmacopœia published under authority appears to have been that of Nuremberg in the year 1482. A physician named Valerius Cordus, who was staying for a short time at Nuremberg, showed a collection of medical receipts, which he had selected from the works of the most eminent writers, to the physicians of that city, who were so struck with its value that they moved him to print it for the benefit of the apothecaries, and obtained for his work the sanction of the senate. Before this time, the books chiefly in use amongst apothecaries were the *trifloria*: *On Triphora* by Arrianus and Serapion; the *Taber Triphora* of Halesius Ben Almoraviz; the *Antidotarium* of Johannes Damascenus or Meis, arranged in classes; and the *Antidotarium* of Nicolaus de Salerno, which was arranged alphabetically. This work was commonly called *Nicolaus Meisus*, in English it from an abridgment known as *Nicolaus Parvus*.

Continuing our remarks to the British Pharmacopœia, we may notice that the first edition of the London Pharmacopœia for, more correctly speaking, of the Pharmacopœia of the London College of Physicians appeared in 1618, and was chiefly founded on the works of Meisus and Nicolaus de Salerno. Successive editions appeared in 1627, 1650, 1697, 1721, 1746, 1787, 1809, 1824, 1830, and 1851; and form an important contribution to the history of the progress of pharmacy and therapeutics during the last two centuries and a half. The nature and the number of the ingredients that entered into the composition of many of the pharmaceutical preparations of the 17th and 18th centuries, would equally astonish most of the practitioners and patients of the present day. In the earlier editions we had camomelat earthworms, snails, woodlice, frogs, toads, puppy dogs, foxes (a fat fox of middle age, if you can get such one), the skull of a man who had been hanged, the blood of the cat, the urine and excrement of various animals, &c.; and electuaries were ordered, containing 50, 62, and in one instance—Mathusale, six from Antidote against Poison and Pestilence—121 different ingredients.

The Edinburgh Pharmacopœia is more modern than the London, the first edition having appeared in 1802; while the Dublin Pharmacopœia does not date further back than 1807. The latest editions of these works appeared in the years 1841 and 1850 respectively.

Until the Medical Act passed in 1858, the right of publishing the pharmacopœia for England, Scotland and Ireland was vested in the Colleges of Physicians of London, Edinburgh, and Dublin respectively; and as these three pharmacopœias contained many important preparations, similar in some instances totally different in strength (as, for example, dilute hydrocyanic acid solution of hydrochloride of morphia, &c.), dangerous complications arose from a London prescription being made

up in Edinburgh or Dublin, or vice versa. By that act it is ordained that 'the General [Medical] Council shall cause to be published, under their direction, a book containing a list of medicines and compounds, and the manner of preparing them, together with the true weights and measures by which they are to be prepared and mixed; and containing such other matter and things relating thereto as the General Council shall think fit to be called *British Pharmacopœia*, which shall for all purposes be deemed to be substantial throughout Great Britain and Ireland, for the several above-mentioned pharmacopœia.' We regret to add, that the *British Pharmacopœia*, which appeared in the beginning of the present year (1864), has given rise to such a general feeling of disappointment throughout the whole ranks of the profession (including even the chemists and druggists, that at a meeting of the General Council (May 1864) it was resolved that a new and amended edition shall be brought out with the least possible delay. For further information on this subject, the reader is referred to 'Virtual and Explanatory Comments on the New Pharmacopœia,' published in the *Lancet*.

PHARMACY (from the Gr. *pharmakon*, a medicine) is that department of *Materia Medica* (q.v.) which treats of the collection, preparation, preservation, and dispensing of medicines. It is synonymous with *Pharmaceutical Chemistry*.

PHAROS. See LIGHTHOUSE.

PHARSALUS, now *PAUSALA*, antiently a town of Thessaly, to the south of Larissa, on the river Peneus, a branch of the Peneus (now the Salambria), and distinguished mainly for the great battle fought here between Cæsar and Pompey, August 9, 48 B.C. Pompey had about 45,000 legions, 7000 cavalry, and a great number of light-armed auxiliaries. Cæsar had 22,600 legions, and 1000 German and Gallic cavalry. The battle-cries of Cæsar's army was 'Veni, vides, vicis!' that of Pompey's 'Hercules instans.' Cæsar's right wing began the battle by an attack on the left wing of Pompey, which was speedily routed. Pompey fled into the camp, and his army broke up; Cæsar's troops stormed his camp about mid-day, and he himself, awaking as from stupor, fled to Larissa, whither Cæsar followed him next day. Cæsar, according to his own account, lost only 50 centurions and 200 soldiers; other accounts make his loss 1500. On Pompey's side about 6000 legionaries fell in battle, and more than 24,000, who had fled, were taken, whom Cæsar pardoned, and distributed among his troops.

PHARYNGORHYNCHI, a sub-order of Demyphorous (q.v.) fishes, characterized by respiratory processes projecting from above the pharynx into the large cavity of the mouth. The P. have no heart, and are the lowest in organization of all fishes. The species are very few. See LAMPRILL.

PHARYNGOGNATHI, an order of fishes, is the system of Müller and Owen; partly *Acrossopterygians* and partly *Molonypterygians* in the system of Cuvier; some of them also *Oxybry*, and some *Ctenoid*. Their common characteristic is the union of the lower pharyngeals into one bone.

PHARYNX (Gr.) is the name of that part of the alimentary canal which lies behind the nose, mouth, and larynx. It is a musculo-membranous sac, situated upon the cervical portion of the vertebral column, and extending from the base of the skull to the level of the fifth cervical vertebra, where it becomes continuous with the oesophagus (q.v.). Its length is about four inches and a half, it is broader in its transverse than in its antero-

posterior diameter, and its narrowest point is at its termination in the œsophagus. Seven *foramina* or openings communicate with it—viz., the two

Fig. 1.—The Pharynx laid open from behind : 1, a section of the base of the skull; 2, 2, the walls of the pharynx drawn to either side; 3, 3, the posterior nares, separated by the vomer; 4, 4, the extremities of the Eustachian tubes; 5, the soft palate; 6, 6, 7, 7, its posterior and anterior pillars; 8, the root of the tongue; 9, the epiglottis overhanging; 10, the opening of the larynx; 11, the posterior part of the larynx; 12, the opening into the œsophagus, whose external surface is seen at 13; 14, the trachea.—(From Wilson.)

posterior nares or nostrils, at the upper and front part of the P.; the two *Eustachian tubes*, opening on the outer surface of the preceding orifices; the mouth; the *larynx*; and the *œsophagus*.

The P. is composed of an external *muscular* coat;

Fig. 2.—External View of the Muscles of Pharynx : 1, the orbicularis oris muscle; 2, the Buccinator muscle; 3, portion of lower jaw, part of which is cut away; 4, pterygo-maxillary ligament; 5, the hyoid bone; 6, the thyroid cartilage; 7, the bicoid cartilage; 8, the trachea; 9, the œsophagus, with the recurrent laryngeal nerve lying between it and the trachea; 10, the stylo-pharyngeal muscle; 11, 12, 13, the superior, middle, and inferior constrictor muscles.

a middle *fibrous* coat called the *pharyngeal aponeurosis*, thick above where the muscular coat is absent, and gradually thinning as it descends;

and a *mucous* coat, continuous with the mucous membrane of the mouth and nostrils. The muscular coat requires special notice. It is composed of a *superior*, *middle*, and *inferior constrictor* muscle on either side, together with two less important muscles, termed the *stylo-pharyngeal* and *palato-pharyngeal* muscles. When the food, after being sufficiently masticated and mixed with saliva, is thrown, by the action of the tongue, into the P., the latter is drawn upwards and dilated in different directions; the elevator muscles (the *stylo-pharyngeal* and *palato-pharyngeal*) then relax, and the P. descends; and as soon as the morsel is fairly within the sphere of action of the constrictor muscles, they successively contract upon it, and gradually pass it onwards to the œsophagus. Independently of its importance in the act of swallowing, the P. exerts an influence on the modulation of the voice, especially in the production of the higher notes.

The P. is not so frequent a seat of disease as many other parts of the intestinal tube. In cases of Diphtheria (q. v.) it is usually the chief seat of the disease. It is liable to ordinary inflammation or *pharyngitis*—an affection characterised by pain, especially in swallowing, without redness in the fauces or change of voice. Little in the way of treatment, except low diet and attention to the bowels, is required; and the inflammation usually terminates in resolution. Sometimes, however, it proceeds to suppuration, and abscesses—dangerous partly from inanition consequent on inability to take food, but chiefly from suffocation due to pressure on the larynx—are formed. These abscesses are more dangerous in the lower than in the upper part of the P., and are more common in young children than in adults. The treatment consists in opening the abscess, which gives immediate relief; but the operation must be conducted with great care, and the incision made as nearly as possible to the mesial line, in consequence of the large adjacent blood-vessels.

PHASCO'GALÉ, a genus of marsupial quadrupeds, of which one species, *P. penicillata*, about the size of a rat, gray, with long soft hair, and a long tufted tail, is common in most parts of Australia, lives chiefly in the hollows of decayed trees, and preys on small animals of every kind. It is much disliked by the colonists, to whom it is known as the *Tapoa Tafa*, on account of its depredations in poultry-yards and larders. It is very agile and audacious.

PHASE'OLUS. See KIDNEY-BEAN.

PHA'SES (Gr. *phasis*, appearance), the different luminous appearances presented by the moon and several of the planets, sometimes the whole, a part, or none, of the luminous surface being seen from the earth. The various phases of the moon, and the reasons of them, are mentioned under the article MOON. Mercury and Venus, being inferior planets, present to an observer on the earth exactly similar phases to those of the moon; but the former require, instead of a month, periods of 116 and 584 days respectively to pass through a complete series of phases. The superior planets, to a certain extent, exhibit phases, but the luminous surface, as seen from the earth, only varies from the full illumination seen when they are in conjunction with the earth to a slightly gibbous appearance when they attain their greatest elongation; and their distance from the sun is so great in comparison with that of the earth, as to render the variation in the form of their luminous surface not observable, except in the case of Mars and occasionally of Jupiter. Galileo was the first to observe the phases of Venus, and he considered them as one of the most satisfactory proofs

of the truth of the co-reptile system. The great brilliancy of Mercury, and its readiness to the sun, presented the pheasant from before as easily noticed, but there were as yet no observed by Manes, and were by many other astronomers. The *U. r.* phase is frequently applied to designate the sensitive stage of an eclipse, from its color.

PHASIANIDÆ, a family of gallinaceous birds, including pheasants, argus, Macaw, and birds, *Amphispiza*, *Amphispiza*, &c.; the latter, however, being excluded by some ornithologists as including parrots and herons (*Parrots*), which differ from it by no very considerable character. The bird is placed higher in the system than the first two, so that only the tip touches the ground. The wings are above.

PHASIA, a river in Calabria, now called the *Alone*. It flows in the mountains of Calabria, flows in a generally western direction, and enters the *Alone* near the mouth of the *Alone*.

PHASIANIDÆ (Gr. *phasianus*, a quail), a family of gallinaceous birds, allied to *Phasianus*, but differing in having the fore legs similar to the other legs, and used like them for locomotion, not for standing and prehension in the want of sustentaculo, and in the similarity of the first joint of the toe to the other joints. They are insects of very extraordinary appearance, inhabiting tropical countries, and spending their lives upon trees and shrubs, the tender shoots of which they devour. Some of them resemble green herons; some resemble herons and waterfowl; whilst others, *wingless*, or nearly so, and with much elongated bodies—can squeeze close under the length—resemble dried twigs. In these peculiarities they owe their safety from enemies, sharing observation, for their motions are slow. Some are known as leaf insects, *Spotted*, *Winged*, *Walking*, &c. The larvae of the *P.* much resemble the perfect insect.

PHASIANUS (*Phasianus*), a genus of gallinaceous birds of the family *Phasianidæ*; having a rather short strong bill, a little curved; the cheeks and skin surrounding the eyes destitute of feathers, and hairy; the wings short; the tail long, its feathers as placed as to slope down, and like an eagle's, the middle feathers longest; the tarsus of the male furnished with a spur. The males of all the species are birds of splendid plumage; the females have shorter bills and dull or ashy colors. There are numerous species, natives of the warm and temperate parts of Asia. The Common *P.* (*P. Chukar*) is said to have been brought from the banks of the *Chukar* in China, to the south of Europe, at a very remote period, its introduction being ascribed in classical times to the Argonauts. From the Phœnix it derived its Greek name *Phœnix*, the origin of its name in English and other modern languages. It was soon naturalized in Europe, and is now diffused over almost all the temperate parts of it. The date of its introduction into Britain is not known, but was certainly before the end of the 13th c.; it has long been plentiful in plantations and game-parks, and has been introduced into almost every part of the country suitable to its habits. The abundance of pheasants in Britain, however, is to be ascribed chiefly to careful game-preservation, without which the race would in all probability have been exterminated. No kind of game falls so easy a prey to the poacher.

A minute description of the Common *P.* is unnecessary. The head and neck of the male are steel blue, reflecting bronze, green, and purple in different lights; the back and wings exhibit a fine mixture of emerald, black, brown, and light yellow; the breast and belly are golden-red, each feather

marginated with black, and reflecting tints of gold and purple. The whole length of a male *P.* is about three feet, of which the tail often measures two feet. The entire length of the female is about two feet. The general color of the female is pale yellowish-brown, varied with darker brown. The sides of the neck tinged with red and green. The ordinary weight of a *P.* is about two pounds and a half; but when pheasants are abundantly supplied with food, and kept undisturbed, they are sometimes four pounds or four pounds and a half in weight.

The nest of the *P.* is on the ground, and is a rude heap of leaves and grasses, in which eleven or twelve olive-brown eggs are laid. But in the half-domesticated state in which it exists in many English preserves, the *P.* does not pay that attention to its eggs and young which it does when more wild, and not subsequently continues to lay eggs for a considerable time, like the domestic fowl; the eggs being removed by the gamekeeper, and hatched by him, along with eggs from birds found among pheasants and hares in the season of mowing. Very young pheasants must be carefully supplied with ants, caterpillars, &c., and the whole difficulty of rearing them is in these earliest stages. Pheasants feed very indiscriminately on berries, seeds, roots, young shoots of plants, *verruca*, insects, &c. *Phœnix*, *Phœnix*, *Phœnix*, and *Phœnix* are not infrequently sown for them in open places in woods, and they creep up bushes and tall trees in winter. They roost in trees at no great height from the ground, and poachers sometimes capture them by burning sulphur below them. During the moulting season, they do not ascend trees to roost, but spend the night on the ground, when they fall a ready prey to foxes. They are fond of woods with a thick undergrowth, in which when disturbed, they naturally seek shelter, running whilst it is possible, rather than taking flight. The male *P.* takes flight much more readily than the female, which apparently trusting in her brown colour to escape observation, often remains still until the sportsman is almost upon her. The male and females do not associate together except during the breeding season, but small numbers of one sex are often found in company. The "short crow" of the male begins to be heard in March. In England and Scotland pheasant-shooting legally begins on the 1st of October, and ends on the 31st of February. The pheasants turned out from the gamekeeper's breeding-yard into a preserve, are in general supplied with abundance of food during winter, and come to the accustomed call as readily as any kind of poultry, so that the superintending of a *phœnix*, in which they are killed by scores or hundreds, is of the lowest kind. It is scarcely necessary to mention that the flesh of the *P.* is in very high esteem for the table.

The female *P.*, in old age, or when from any cause incapable of the functions of reproduction, sometimes assumes the plumage of the male. The *P.* exhibits a remarkable readiness to hybridise with other gallinaceous birds. A hybrid between it and the common fowl is not infrequent, and is called a *Phœnix*. Hybrids between the *P.* and Black Game have also occurred; and hybrids are supposed to have been produced between the *P.* and Guinea fowl, and the *P.* and turkey. None of these hybrids, however, have ever been known to be fertile, except with one of the original species. On the contrary, the offspring of the Common *P.* and the *Phœnix* (*P. Chukar*) is perfectly fertile, a circumstance which is urged in argument by those who regard them as mere varieties of one species. The Ring-necked *P.* is now almost as plentiful in Britain as the Common *P.*; it is a native

of the forests of India and China, and is said not to breed with the Common P. in a truly wild state, but in Britain they readily intermix. It is distinguished by a white ring almost surrounding the neck, and is of smaller size than the Common P., somewhat different in markings, and has a shorter tail.—The BOHEMIAN P. is another variety of a silvery-gray colour.—White pheasants are of not very unfrequent occurrence.—Of other species of P. may be mentioned DIARD'S P. (*P. versicolor*), a native of Java, in which the prevailing colour is green; and REEVES'S P. (*P. Reevesii*), a native of the north of China, in which white is the prevailing colour, and the tail is of extraordinary length, so that a bird not larger than the Common P. measures eight feet in entire length. Of somewhat different type, and more nearly approaching to the common fowl, are the GOLDEN P. (*P. pictus*, or *Thaumatia picta*) and the SILVER P. (*P.* or *Gallophasias nycthemerus*), both natives of China, and both hardy birds, the introduction of which into British preserves has been attempted with good prospect of success. Both have long been kept in a state of domestication by the Chinese. The Golden P. is one of the most splendid of the tribe. It has a fine crest, and a ruff of orange and black, capable of being erected at pleasure. The tail is very long. The crest and ruff are held in great estimation by anglers for making artificial flies.—LADY AMHERST'S P. (*P.* or *Thaumatia Amherstiae*) is a native of China, resembling the Golden P., and with an extremely long tail.—The Silver P. is one of the largest and most powerful of the tribe, and very combative, driving the Common P. from preserves into which it is introduced. The prevailing colour of the upper parts and tail of the male is white, finely pencilled with black, the breast and belly purplish-black.—The name P. is sometimes extended to gallinaceous birds of allied genera.

PHEASANT-SHELL (*Phasianella*), a genus of gasteropodous molluscs of the family *Turbinidae*, of which the shells are much valued for their beauty, and when they were rare in collections, were sometimes sold for extraordinary prices. They are now comparatively cheap and plentiful, being found in great numbers on some parts of the Australian coast.

PHEIDIAS (Lat. *Phidias*), son of Charmides, the greatest sculptor of ancient Greece, born at Athens probably between 500–490 B.C. His first instructor in art was Hegias of Athens; he afterwards studied under a more famous master, Ageladas of Argos. He appears to have first acquired distinction in his profession soon after the battle of Salamis, and indeed his great works were all executed during a period most favourable for the development and encouragement of genius, when Greece was triumphant over external enemies, and her people enjoyed a more perfect liberty than almost at any other period of their history. With the character of the age correspond the works of its poets, particularly of the tragedians Æschylus, Sophocles, and Euripides, and of its sculptors, particularly of Pheidias. Under Cimon's administration the Athenians began the work of restoring their city, which the Persians had destroyed, in more than its former magnificence, and to fill it with noble works of art. P. was accordingly employed in making the colossal brazen statue of Minerva, *Athena Promachos*, which was placed upon the citadel, and was executed probably about 460 B.C. To the government of Cimon succeeded that of Pericles, still more brilliant, and signalled by an extraordinary development of art. Pericles not only gave to P. a commission to execute all the

more splendid statues that were to be erected, but made him general superintendent of all works of art going on in the city. Plutarch tells us that P. had under him architects, statuaries, workers in copper and bronze, stone-cutters, gold and ivory beaters, &c. To P., as director-general of all the skilled artists and artificers of Athens, we owe, among other glorious edifices, the Propylæa and the Parthenon, the sculptured ornaments of which were executed under his direct superintendence, while the statue of the goddess Athens, the materials for which were ivory and gold, was the work of P. himself (circa 438 B.C.). This statue was clothed with a golden robe, which alone was worth 44 talents of gold. The statue is gone for ever, and the Parthenon is now only a magnificent wreck, but we still possess some splendid evidence of the genius of P., in the sculptures of the metopes, and friezes of the temple of Athens. See **ELGIN MARBLES**. Next year P. went to Elis, where he executed a colossal statue of Zeus for the Olympeum at Olympia (q. v.), also of ivory and gold (about 433 B.C.). This was reckoned his masterpiece. On his return to Athens, political passions were running high. There was a strong—at least a violent—party inimical to Pericles, but as they did not dare to attack the great statesman, they assailed him through his friends P., Anaxagoras, Aspasia, &c. P. was accused of having appropriated to himself some portion of the gold destined for the robe of Athens. This accusation he repelled by taking off the robe and weighing it. He was then accused of impiety, for having introduced his own likeness and that of Pericles on the shield of the goddess. On this most frivolous and contemptible pretext he was thrown into prison, and died there, but whether of sickness or poison is uncertain. His death took place about 432 B.C. The works executed by, or ascribed to P., were numerous, but we have mentioned the most celebrated. Their prevailing characteristic appears to have been an ideal sublimity, and even the imperfect relics that we possess are the most noble specimens of sculpture in the world.

PHENOMENON (Gr. *appearance*), the name given in philosophy to an object or fact as it is perceived by us, as distinguished from what it is in itself. In the philosophy of Kant, that, whatever it may be, which is behind the phenomenon, and causes it, is called the *noumenon*, as being merely assumed or thought of in the mind. See **METAPHYSICS**, **PERCEPTION**.

PHENYL, and the **PHENYLIC GROUP**. Phenyl (C_6H_5) is an organic radical, which has not yet been isolated. Its most important compounds are: (1.) Carbolic or Phenic Acid (HO, C_6H_4, O), known also as Phenol, Hydrated Oxide of Phenyl, and Phenyl-Alcohol. See **CARBOLIC ACID**. (2.) Hydride of Phenyl (C_6H_5), known also as Benzole, Benzine, and Phenol. See **BENZOLE**. (3.) Phenylamine or Phenylia (C_6H_5, H, N , or C_6H_4, N), better known under the name of Aniline, one of the most important of the artificially formed bases.

Aniline derives its name from *anil*, an obsolete name for indigo, which is one of the sources from which it is most readily procured. It exists amongst the products of the distillation of coal, and probably other organic compounds, but is always obtained by the manufacturing chemist either from indigo or from nitro-benzole. Dr Hofmann, to whom we are mainly indebted for our knowledge of the chemistry of this substance, gives the following directions for obtaining it from indigo: 'Powdered indigo boiled with a highly-concentrated solution of hydrate of potassa, dissolves with evolution of hydrogen gas

PIRENE—PIRACALAN MARBLES.

is a hygroscopic liquid, containing a peculiar acid, called hyponitric acid. If this matter be exposed to a retort, and still further heated, it swells up, and dissolves out, which continues to the extent of only drops in the neck of the retort and in the receiver. Separated from the ammoniacal water by which it is decomposed, and re-distilled, it is obtained nearly colourless. The formation of aniline from indigo is represented by the following equation:

In this process, the indigo is made to yield about one-third of its weight of pure aniline. Nitrobenzene is converted into aniline by the action of various reducing agents such as hydrosulphate of ammonia; a solution of arsenite of iron; and the distillation of one part of nitrobenzene, two parts of acetic acid, and one and a half parts of iron filings, is regarded by Hofmann as the best means of preparing aniline, which is now required in large quantities for the dye.

When pure, says Dr Hofmann, 'aniline forms a deep red, columnar liquid, of faint rose colour, and somewhat burning taste.' It is very soluble, but has considerable high boiling point, 361°. In the air it gradually becomes yellow or brown, and requires a vacuum desiccator. Its density is 1.026. It is destitute of alkaline reaction on litmus, but is decomposed by the number and beauty of the crystalline compounds it forms with some other substances reactants characterise this body, and distinguish it from all others—viz., that with osmic acid, and that with solution of hypochlorite of lime. The former gives with aniline a deep-red or blackish precipitate; and the latter, an extremely beautiful violet-coloured compound, the due time of which is, however, very soon destroyed. In the manufacture of aniline on a large scale, several bases having higher boiling-point than aniline are formed. To one of these—a base of aniline compound, represented by the formula $\text{C}_{12}\text{H}_{10}\text{N}_2$ —the name of *Piracalan* has been given, from its being isomeric with aniline. Aniline is sometimes of the greatest importance to Historical Chemistry, from the large number of derivatives and substitution-products which it yields, and as the knowledge of which we are almost entirely indebted to Hofmann, whose investigations originally appeared in a series of papers in the *Transactions of the Philosophical Society*. These compounds are, however, for the most part of too complicated a nature to be noticed in these pages. But, independently of its theoretical importance, this substance has recently been extensively employed in the arts, a number of products of uncoloured bodies having been obtained from it by the action of oxidising agents. It is to the W. Perkin that we are indebted for the idea of applying practically the property possessed by aniline of forming violet and blue solutions with osmic acid, and with hypochlorite of lime, to which we have already referred; and he succeeded in fixing these colours, and adapting them to the use of the dye. The most important of these colouring anilines are described in the article DYE-STUFFS (p. 30).

(b) Transphosphoric Acid $\text{HIO}_2\text{H}_2(\text{SO}_4)_2$, in which three of the equivalents of the hydrogen of phosphoric acid are replaced by three equivalents of the group NO_2 ; known also as Carbonic Acid (p. 4) and Phos. Acid. In addition to the remarks

contained in the article on CHLOROPIC ACID, it may be noticed that while a solution of this acid immediately a bright yellow tint to animal textures, as the skin, wool, and silk, it has no such effect on the most sensitive of vegetable fibres, such as cotton and flax, and hence it may be employed in some cases without the materials of any tissue being so the animal as to the vegetable kingdom. A solution of a salt of this acid, when treated with nitric acid, yields a beautiful green colour, which is employed in the manufacture of artificial flowers, and for various other purposes. In doses of from 2 to 10 grains, it acts on rabbits as a strong poison, producing convulsions and speedy death. It has been prescribed in small doses, with moderate success, in cases of intermitting fever; but patients to whom it is given should be previously informed that it possesses the property of giving to the eye a yellow tint, as it were, a jaundiced appearance. All the salts of this acid are of a beautiful red or yellow tint, and most of them form brilliant crystals. When heated, or in some cases when fully dried, they explode with considerable violence.

PIRENE, in Herakley, the barbed head of a dart. It is represented as engraved on the lower side, and its position is with the point downwards, unless otherwise blazoned.

PIRENE, a powerful city of Thessaly, near Mount Pelion; according to legend, the assumed royal seat of Aeneas and Alceus; and afterwards of political consequence under 'Pyrrhus' of his own, who long made their influence felt in the affairs of Greece, and repeatedly attempted to make themselves masters of Thessaly. One of these Pyrrhus named Alexander, is particularly celebrated for his cruelties. It was one of his practices to bury innocent persons alive, and another to sew them up in the skins of wild beasts and set his hands upon them. After a bloody reign of thirteen years, he was slain by his wife and her brother, 359 B.C. Five years later, P., with the rest of Thessaly, became subject to Philip of Macedon.—At P. there was a mineral spring, named Hyperia, famous for its healing virtues. A few ruins at Volonimo still mark the site of the city.

PIRRECYDES, an ancient Greek writer, born in the island of Syros, one of the Cyclades, in the 6th c. B.C. He is said by Diogenes Laertius to have been a rival of Thales, and to have learned his wisdom from the Egyptians and Chaldeans. He wrote a *Comagony* in a kind of prose much resembling poetry, under the title *Hepiagogy*, the meaning of which is doubtful. In a manner rather poetic than philosophic, he endeavoured in this work to show the origin of all things from three eternal principles, *Time or Kronos; Earth*, as the formless and passive mass; and *Ether or Zeus*, as the formative principle. He taught the doctrine of the existence of the human soul after death; but it is uncertain if he held the doctrine of the transmigration of souls, afterwards promulgated by his disciple, Pythagoras. Of his work, only fragments are extant, which have been collected and elucidated by Sturz (Gera, 1795; 2d ed., Leip. 1824).—Another P., who lived in the 5th c. B.C., compiled the mythical histories of Athens and other states, but, except a few fragments, the work is lost. See Sturz, *Pherecydis Fragmenta* (Leip. 1824).

PIRACALAN MARBLES, the name now given to the sculptural frieze taken from the cella of the temple of Apollo at Piracalan in Arcadia in 1814, and transferred to the British Museum. It represents the contests between the Centaurs and Lapiths. The Piracalan temple of Apollo is, next to the Thessalon at Athens, the most perfect architectural

ruin, in all Greece; but owing to its sequestered position at the head of a lonely and rocky glen among the Arcadian hills, it long remained unknown in modern times, except to the shepherds of the district; and to the same circumstance it probably owes, in part, its preservation. Chandler first visited and described it in 1765; he was followed by Gell, Dodwell, and others; and in 1812 it was very carefully examined by a body of artists and scholars, the results of whose investigations are given in Stackelberg's *Der Apollo-tempel zu Bassæ in Arkadien* (Rome, 1826). The temple is built of a hard yellowish-brown limestone, stands north and south, was originally about 125 feet long and 48 broad, and had 15 columns on either side, and 6 on either front, in all 42, of which 36 still remain.

PHILADELPHIA, the chief city and seaport of Pennsylvania, U.S., and the second city in population and importance in America, is situated on the west bank of the Delaware River, at the mouth of the Schuylkill, on a plain 2 to 4 miles wide between the two rivers; lat. 39° 56' 59" N., long. 75° 9' 54" W.; 136 miles north-east of Washington, 87 miles south-west of New York. It is 5 miles long by 3½ wide, having 12 square miles, laid out by its founder, William Penn, in streets crossing each other at right angles. The city is neatly but plainly built of red bricks and marble, with 7 squares laid out as parks. The picturesque eminence of Fairmount, with its reservoirs of water raised from the Schuylkill, and the Laurel Hill and other ornamental cemeteries, are favourite public resorts. Among the finest edifices are the Custom-House (formerly United States Bank), Mint, and the buildings of the Girard College, all built of white marble, the latter, in the Corinthian style, having cost, with the surrounding buildings, 2,000,000 dollars. There are 4 or 5 theatres, and an 'Academy of Music' capable of seating about 3500 persons, some 350 churches, about 60 of which are Episcopal, 70 Presbyterian, and 80 Roman Catholic, among which is a magnificent Cathedral, just completed; numerous and magnificent hotels, markets, and public institutions. The most noted building is Independence Hall, occupied in the revolution of 1776 by the Continental Congress, in which was voted and signed the Declaration of Independence. The Philadelphia Library, founded by Benjamin Franklin, contains 80,000 volumes. There are also an Academy of Fine Arts, an Academy of Natural Sciences, Girard College, the University of Pennsylvania, and several flourishing medical colleges. The public schools of Philadelphia comprise 2 high schools, 60 grammar-schools, and more than 300 schools of lower grades. The Girard College, founded by Stephen Girard, a Philadelphia merchant, supports and educates 600 orphans. Next to New York, P. is the largest publishing emporium in the country, issuing, besides books, about a dozen daily papers, 40 weekly papers, and 50 periodicals. Among the charitable institutions, for which the city is noted, are 22 hospitals and dispensaries, 14 asylums, 4 lying-in charities, and 14 for the relief of the poor; a city almshouse, with 3000 inmates; house of refuge, &c. There are 15 military hospitals, with beds for over 18,000 patients. The Eastern State Penitentiary is a model institution on the system of solitary confinement. The city, divided into 28 wards, is governed by a mayor, a select council of 26, and common council of 44 members. The city revenue is 2,724,709 dollars; its debt, 21,000,000 dollars. The United States mint, established 1791, had, up to 1862, coined 404,928,876 dollars in gold and 97,725,589 dollars

in silver. There are several fine brick market-buildings; some 25 banks of issue; 7 or 8 savings banks; board of trade; merchants' exchange; corn exchange; an excellent harbour; imports, direct and by New York, of 45,000,000 dollars per annum; a large coal trade; railways which in 1860 conveyed goods to the interior to the value of 140,000,000 dollars; manufactures of iron, machinery, cotton, woollen, clothing, chemicals, boots and shoes, furniture, &c., amounting to 175,000,000 dollars a year. P. was founded in 1682 by William Penn, on 'a spot that seemed to have been appointed for a town,' and of which he wrote, 'Of all places in the world, I remember not one better seated.' Its early settlers were mostly of the Society of Friends. In 1684 it had 2500 inhabitants. It grew rapidly by large immigrations from Germany and the North of Ireland. In 1729 was established the *Pennsylvania Gazette*, afterwards edited by Franklin. The first colonial congress met here in 1774; in 1777 the town was occupied by the British forces under General Lord Howe, when the city contained 21,767 inhabitants. It was the seat of the United States bank, the capital till 1800, and the first city in America, until surpassed by New York. Pop. (1860) 565,531.

PHILÆ, the name of a celebrated island lying in the midst of the Nile, south of Syene, beyond the frontier of Egypt, in 24° 1' 28" N. lat. It was called by the Egyptians Menlak, the place of the Cataract; or *Menub*, the Abaton or Sanctuary; and by the Copts, Pilak or 'Cataracts.' It is a small granite rock, about 1000 feet long, and 200 feet broad, on which is placed a suite of buildings, not of the most remote antiquity, but distinguished for great architectural beauty. The oldest of these, consisting of a hypæthral or roofless hall, was built in the reign of Nectanebus I., 377—357 B.C. A second mention of the same monarch occurs on the first propylon, where a door, constructed in his reign, has been incorporated into the constructions by a later Ptolemy. Both these are dedicated to the goddess Isis, who in P. was venerated as Athor or the Egyptian Venus. The principal remains consist of the great temple of Isis, erected by Ptolemy II. or Philadelphus, and continued by his successors, especially by Ptolemy III., Evergetes, 247—222 B.C.

The temple consists of a shrine or *sekos*, a pronaos, an open portico, and two pylons or gateways. Both of the propylons were constructed by Ptolemy VII., or Philometer, and Lathyrus; but the first was added to by Ptolemy IX., or Evergetes II., 145—141 B.C. On the second pylon, the monarch is represented slaying the hostile nations. The colonnade was principally erected by Tiberius. The charming little temple, the Mastabat el Pharaoun, or Pharaoh's Bed of the Arabs, was made in the reign of Trajan, 100 A.D. The temples are particularly important as containing the principal representations of the story of Osiris, his birth, bringing up, death, and embalment by Isis. Commenced in the reign of Nectanebus I., and continued by the Ptolemies and Romans, the worship of Isis lingered here till 435 A.D., or sixty years later than the edict of Theodosius. After the subjection of the Blemmyes to the Nubian Christians, the temple was converted into a church, and the paintings daubed with mud; and in 577 A.D., the bishop Theodorus changed the pronaos of the temple of Isis into the church of St Stephen, and a Coptic church, at a later period, was built out of the ruins. The whole area of the ancient temple was about 435 feet long by 135 broad, in the centre of the dromos. At the present day the island is deserted. It is a favourite resort of travellers

according to Nibbs, and is one of the best of the numerous round stones of ancient Egypt.

Proc. N. H. S., v. 29; *Review, Acad.*, v. 104; *Trans. Acad. Sci. on the Nile*, Wilkison, *Review Acad.*, v. 234-235; *Revue, Archéologique*, p. 290; *Copied, Revue*, p. 292.

PHILANTHROPY, a word formed from the Greek, and signifying the 'love of mankind'. In the history of German school education it has acquired a special meaning. The influence exerted by Rousseau was not less great on education than on politics, and was as visible in the pedagogues of Germany, and Switzerland as in the men of the French Revolution. It is to the belated and somewhat adrevised by the author of *Emile*, a desire to nature in social life and in the training of the young, that Rousseau owed his novel and enthusiastic school-reformations. A first notice of this institution, which was opened under his auspices at Geneva in 1754, and which was called *l'Institut*, is given in the article on Rousseau. Other establishments of the same kind were founded in different parts of France—but the only one which still survives is Rousseau's Institute at Palmarès, in the Jura, founded in 1794.

PHILISTION AND BAUTIS, according to a Jewish myth, once perished by David in his *Misophony*—was a married pair, remarkable for their mutual love. *Phylis* and *Misyon*, wandering through Phrygia in human form, were released liberally by every one, till this good pair took them to be wicked folk, and gave them each a hundred men so they could prove. On going away, the men took them with them to a neighbouring mountain, on looking from which they saw their village surrounded with a flood, but their own village changed into a splendid temple. *Phylis* permitted them to enter any temple they chose, but they only asked to be servants of his temple, and that they might die at the same time. When, accordingly, they were seated at the door of the temple, being now of great age, they were changed, *Phylis* into an oak, and *Misyon* into a linen. They hid the change taking place, and as long as the power remained with them, led most tenderly upon one another.

PHILEMON, ROMANUS OR PAUL, is the master of the four extant letters which the apostle wrote from Rome during his captivity. We either identify him, or legitimately infer from its contents, that *Philemon*, who probably lived at Colossæ, was then of considerable wealth, the head of a numerous household, and devoted to the poor. He had possessed a slave called *Onesimus*, who had run away from him, after it has been thought years of writing he defrauded him. *Onesimus*, however, coming to Rome, had been brought into contact with Paul, and converted to Christianity. At the last apostle thought to retain him as his personal attendant, for he was now, as he tells us (verse 9, 'Paul the aged,' but on further consideration, he resolved to send him back to his former master. The epistle is simply a brief letter, begging *Philemon* to pardon *Onesimus*, and to receive him back now as a servant, but slave a servant, a brother beloved! It exhibits an exquisite tenderness and delicacy of feeling, with all that tact and subtlety of address, by which Paul was wont to lead his way into the innermost heart of man. The universal evidence of its authenticity is complete. Any man has concluded that modern criticism in basing the particular book upon a greater risk of being used to the imposition of an excessive demand—a method sensibly to doubt and demand—is continuing the clause of any other epistle ascribed to Paul.

PHILIPPO, the assumed name of a French family, which has produced many distinguished musicians, and one celebrated composer. The real name of the family was *DARTMAN*, and the additional appellation *P.* was assumed by Michel Dardman, the brother of Louis XIII, on account of his having equalled a celebrated player in the most instrument, named *Philos*. The name was transmitted to his descendants, the most famous of whom was his grandson, *FRANÇOIS ANTOINE DARTMAN*, who was born at Orléans, in the department of Eure et Loir, 1731, studied music, and produced a great many comic operas all long forgotten. It may be noted that, while residing in London—whether he had fled at the outbreak of the revolution—1779, he had to name the 'Carnet des arts' of France, a work which is considered by many as a masterpiece of musical art. He died in London, 31st August 1798. His modern reputation rests exclusively on his skill in the game of chess, the principles of which he has laid down with exceeding clearness. It was to guard measure his position for this game which prompted him to visit Germany and Holland, where at that time the most distinguished players were to be found, in order to measure his strength with them. He was one of the founders of the London Chess Club. Once it was that in 1777 he published his *Leçons de Jeu des Échecs* (*Analysis of the Game of Chess*). One principle, then unique, seems to be at the root of all P.'s games—i.e., to maintain and support carefully the pieces in the centre of the board—and rather than deviate from this principle he rejects the opportunity of making an effective and adequate move more. He practised with success the playing of games blindfold; but in this particular he has been far surpassed in recent times by Harrwitz, and more recently by Morphy.

PHILIP II. King of Macedonia, and father of Alexander the Great, was born at Pella in 382 B.C. He was the youngest son of Amyntas II. and Eurydice. At Thessaly, whither he was taken as a hostage by Philip, he spent part of his early life, employing his whole in studying the art of war, and the constitution and laws of the Greek states, as well as the literature and the character of the people—pursuits which were of the greatest service to him afterwards, when called on to administer the government of the Macedonian Kingdom. The assassination of his eldest brother, Alexander II., by *Polyperch* Alceus, after a short reign of two years (369-367 B.C.), and the death of his second brother, Perdiccas II., in battle (360 B.C.), placed him at the head of affairs in Macedonia, as guardian to his nephew Amyntas, still an infant. In a few months, P. made himself king, the rights of Amyntas being set aside. Dangers soon beset him from without and from within. The Illyrians and other neighbouring tribes assailed his kingdom on different sides; while two pretenders to the throne, urged on by the Athenians and Thracians, stirred up civil commotion. But foreign and domestic enemies soon disappeared before the decision, the energy, and the wise policy of the young king. In the brief space of a year he had secured the safety of his kingdom, and had gained for himself a dread name. At that time he was only 24 years of age. Henceforward his policy was one of aggression, and his every thought was directed to the extension of his empire and the spread of Macedonian influence. The Greek towns on the coast of Macedonia were the first objects of attack. After possessing himself of Amphipolis and Pydna, by means little consistent with the oath of treaties, he handed over to the Olynthians the city of Potidaea, which he had taken from the Athenians. In Thessaly he captured the small town Oenoe, which, under its new name,

PHILIPP, soon acquired great wealth and fame, and ultimately became celebrated in profane as well as in sacred history. The surrounding district was rich in gold-mines, which proved a source of great revenue to P. (about, say, £250,000 annually), and supplied him plentifully with the means of paying his armies, of bribing traitorous Greeks, and of opening the gates of many cities, the sieges of which might otherwise have cost the blood of thousands. After a few years of comparative leisure, he turned his ambitious views southward; and capturing Methone (at the siege of which he lost an eye), he advanced into Thessaly, and ultimately to the Strait of Thermopylæ, which, however, he did not attempt to force, as it was strongly guarded by the Athenians. He therefore returned into Macedonia, and directed his arms against the Thracians, waiting for a more fitting occasion to carry out his darling project. Such an opportunity was not long wanting. After capturing all the towns of Chalcidice—the last of which was the important city of Olynthus—he made peace with the Thracians, and next year with the Athenians, who had been at war with him in defence of their allies the Olynthians. It was this siege of Olynthus by P. which called forth these Olynthiac orations of Demosthenes, which are still admired as efforts of oratorical genius hitherto unequalled in any country. P. was now requested by the Thebans to interfere in the war ('the Sacred War') which was raging between them and the Phocians. He marched into Phocis, destroyed its cities, and sent as colonists to Thrace many of the inhabitants (346 B.C.). The place which the Phocians had occupied in the Amphictyonic Council was transferred to P., and he was appointed, jointly with the Thebans and Thessalians, as president of the Pythian games. His next step was to secure a footing in the Peloponnese, by espousing the cause of the Argives, Messenians, and others, against the Spartans. In 339 B.C. the Amphictyonic Council declared war against the Locrians of Amphissa; and, in the following year, appointed P. commander-in-chief of their forces. The Athenians were alarmed at his approach into Greece in this capacity, and formed a league with the Thebans against him; but their united army was utterly defeated at the battle of Cheronea (338 B.C.), and all Greece was at the feet of the conqueror. He was now in a position to enter on the great dream of his later years—viz., to invade the Persian empire, and revenge the injuries of Greece. Deputies from the different states of Greece assembled in congress at Corinth; and after resolving to make war on the Persian king, chose P. as leader of their armies. Preparations were in progress for this great expedition when he was suddenly cut off by the hand of the assassin Pausanias, at a festival celebrating the marriage of his daughter with Alexander of Epirus (336 B.C.). A private grudge at P., for neglect to punish an insult offered to Pausanias by Attalus, was said to be the motive which inspired the murderer, though suspicion is not wanting that the deed was done at the instigation of Alexander and his mother Olympias, who had retired from the court in disgust at P.'s marriage, the year previous, with Cleopatra, daughter of Attalus, one of his generals. P. was a man given to self-indulgence and sensuality; he was faithless in the observance of treaty obligations, and unscrupulous as to the means by which he gained his ends; but he had to deal with factious and faithless opponents, which may help to explain, if it does not justify his policy; while his clemency as a victor has won the admiration even of the virtuous Cicero, who pronounces him 'always great.' Of his force and energy of

character, his acuteness, fertility of invention, and eloquence, it is impossible to speak too highly. He was at the same time a lover of learning, and a liberal patron of learned men. He reigned from 359 to 336 B.C.

PHILIP III., OF MACEDON. On the death of Alexander the Great at Babylon in 323 B.C., the army elected as king, under the name of Philip III., Arrhidæus, son of Philip and Philina of Larissa, one of his many wives. He was a youth of weak understanding, and was totally unfit for the duties of government. His wife Eurydice (daughter of Amyntas, son of Perdiccas III.), whom he married in 322 B.C., endeavoured, on their return to Macedonia, to oppose the measures of Polyperchon and Olympias in support of the young Alexander, posthumous son of Alexander the Great and Roxana. But her army was defeated; she herself was taken prisoner; and, along with her husband, was put to death in 317 B.C.

PHILIP II., KING OF SPAIN, the only son of the Emperor Charles V. (q.v.) and Isabella of Portugal, was born at Valladolid, 21st May 1527. He was brought up in Spain, and carefully educated under the superintendence of able tutors, by whose instructions he greatly profited, becoming an accomplished linguist and mathematician, and a connoisseur in architecture and the fine arts. But all attempts to indoctrinate him with the chivalric ideas of the time were utterly futile. From his very childhood he was distrustful and reserved; he invariably spoke with slowness and an air of deep reflection which was too marked to be wholly real, and exhibited in his manners a *sang-froid* which even in his early years was rarely disturbed by ebullitions of passion. While still very young he was intrusted, under the direction of a council, with the government of Spain, and in 1543 he espoused Mary of Portugal, who died three years after. In 1548 he went to join his father at Brussels, and there adopted the multitudinous equipage and minute and pompous etiquette of the late Burgundian court, which from this time he retained. While at Brussels, P. was presented to his future subjects, and was at the same time fully initiated into his father's policy, the two chief items of which were the maintenance and extension of absolute rule throughout his dominions, and the support and propagation of the Catholic religion. In 1554 he married Mary Tudor, Queen of England, and to gain the support of that country to his political projects, and at the same time restore it to the Roman Catholic pale, he laid aside his ordinarily cold and haughty demeanour, and laboured to ingratiate himself with his wife's subjects, taking the utmost care to avoid exciting the national jealousy of foreign influence. But his plans were discovered and frustrated, and this disappointment, combined with the annoyance to which he was subjected by the jealousy of his wife, prompted him to leave England (which he did for ever), and return to Brussels (September 1555). In the following month he became, by the abdication of his father, the most powerful potentate of Europe, having under his sway, Spain, the Two Sicilies, the Milanese, the Low Countries, Franche Comté, Mexico, and Peru; his European territories being more fertile, and their inhabitants more wealthy and prosperous, than any others on the continent, while his army was the best disciplined, and headed by the greatest generals of the age. The treasury alone was deficient, having been drained by the enormous expenditure of his father's wars. P. was eager to begin the crusade in favour of Catholicism, but he was compelled to postpone

leading to a league which had been formed between France, the Pope, and the Sultan, to surprise her at the Italian dominions. He soon got over his religious scruples at comparing in warfare with the pope, and intrusted the defence of the Sicilies to Philip of Aragon, who speedily drove out the pope and his forces, and conquered the royal territories, while P. himself strenuously prosecuted the war against France in the north, and defeated the French at St. Quentin (q. v.) (August 10, 1557) and Gravelines (July 13, 1558). These reverses forced the French (the pope having already made a separate treaty) to agree to terms of peace at Cateau-Cambrésis (April 2, 1559). P.'s wife was now dead, and after an unsuccessful attempt to obtain the hand of his daughter, Queen Elizabeth, he married Isabella of France, and returned to Spain, where from this time he always resided. Before leaving the Low Countries, he solemnly promised to withdraw himself and all his Spanish troops who preyed upon the peaceful Flemings, but he firmly refused to assent to modify the rigorous policy of his father against heretics. His realm being now at peace, he resolved, as a necessary preliminary to the re-organisation of his great presiding kingdom, to replenish his treasury: a thing impossible without forced contributions, which at that time could only be obtained in those countries over which he held despotic rule—viz., Spain and America. He therefore set about establishing absolute government in some of his states that were in possession of mining like free institutions, and with this view sought to introduce the Inquisition into the Low Countries and Italy. But the introduction of this instrument of tyranny was successfully resisted in Naples and the Milanese, in spite of its powers were so shackled as to render it quite a harmless institution, but those failures only stimulated him the more to establish it in all its pride and power in the two countries. For a number of years it continued in various cities in that country, but the natural result of such a course of conduct was a universal reaction of all classes, Catholic and Protestant, which was partially successful—the northern provinces (the 'seven united provinces') obtaining their independence in 1573. In this conflict the resources of Spain were largely expended, and to replenish his treasury in the speediest manner possible P. exacted enormous contributions from Spain, abolishing all special communal or provincial privileges and rights which might interfere with his avarice, and suppressing all inuredness and dissipation by force of arms or the Inquisition. During the first half of his reign he engaged in a costly warfare with the Barbary corsairs, who were supported by the Turks—the only memorable success of which was the famous naval victory of Lepanto (q. v.), won September 16, 1571. In 1580 he drove the king of Portugal having become extinct, P. laid claim to the throne, and after the Duke of Alva had vanquished the kingdom with an army, the Spanish monarch's title was recognised by the Portuguese states. His enmity to England on account of the anti-Spanish policy of Queen Elizabeth, induced him to attempt the conquest of that country, but his most formidable attempt failed signally. See *ARMADA*. After the accession of Catherine de Medici to power, France and Spain drew closer the bonds of unity which had previously existed between the two countries; but the refusal of Catherine to adopt P.'s plans for the wholesale slaughter of heretics produced a coolness in their relations. However, when Henry, king of Navarre, a Huguenot, became heir presumptive to the throne, P. allied himself with the Guises and the other chiefs of the Catholic party who were in rebellion, and his

obstinate persistence in these intrigues after the cause of the Guises was shown to be hopeless, prompted Henry to declare war against him. The French king had the worst of it, and P. was glad to conclude the treaty of Vervins (21 May 1598). Deceased in the December at Madrid, on 13th September of the same year. It cannot be denied that P. was gifted with great abilities, but he was more visionary, especially in politics, and engaged in so many great enterprises at once as to overcloud his resources without leading to any good or profitable result. No single kingdom in Europe could have long stood against him, but he was always at war with at least two at a time; and even the splendid opportunity which the extinction of the direct Capetian line in 1589 gave him for uniting France, Spain, and Portugal in one great monarchy, could not restrain his insatiable pecuniary. His fanatical enthusiasm for Catholicism, in which he was carried by an man who ever lived, and the zeal with which he prosecuted all heretics through the Inquisition, combined with the odious tyranny of his secular government to degrade Spain by breaking the proud and glorious spirit which had been the source of its pre-eminence among European nations, while his violent persecution of the industrious Moriscos, and his oppressive exactions put a stop to the progress of the country. By his fourth wife, Anne of Austria, he had a son, Philip III.

PHILIP V., king of Spain, and the founder of the Bourbon dynasty in that country, was the second son of the Dauphin Louis (son of Louis XIV.) of France, and was born at Versailles, December 18, 1683. The last king of Spain of the Hapsburg dynasty, Charles II., had unsuccessfully presented the succession to the throne to Charles, archbishop of Austria the great grandson of Philip III. of Spain, and to P. then Duke of Anjou, the son of his own eldest sister; but having signed a secret treaty which had been agreed to between England, France, and Holland, for the partition of Spain, he, to prevent the dismemberment of his kingdom, left by will the succession to P. of Anjou. France immediately succeeded from the partition treaty, and, on the death of Charles II. in 1700, P., who was the favourite candidate among the Spaniards, with the exception of those in the eastern provinces, took possession of the kingdom (April 21, 1701); and, to gain over Savoy to his side, and thus create a diversion in Italy against Austria, he married Maria Louisa, daughter of Victor Amédée. War almost immediately broke out between the rival claimants, Charles being supported by the 'grand alliance,' which included England, Austria, and Holland, and subsequently (January 1702) Prussia, Denmark, and Hanover (May 1703), Portugal, and (October 1705) Savoy. See *SPANISH WAR OF SUCCESSION*. The fortune of war was mostly on the side of the allies; but France and Spain carried on the contest heroically, and, though at great sacrifices, the throne was secured to P. by the peace of Utrecht (April 11, 1713). In the following year the queen died, and P. espoused Elizabeth Farnese of Parma, who immediately induced her husband to commit the reins of government to Allarum (q. v.); in fact so much was the weak-minded king under the influence of his talented young wife, that he granted everything she asked. 'He was,' says Samuel, 'remarkable for good nature, he had few faults and as few virtues, his sentiments were just and honourable, but he was wholly deficient in energy; he had no taste for anything beyond devotional exercises and the chase; he was made in his government, and he was so all his life.' Allarum's adventurous foreign policy, which at first succeeded in restoring the

Spanish rule in Sicily and Sardinia, brought down upon Spain the wrath of the Quadruple Alliance (France, England, Holland, and Austria), and war was only averted by his being dismissed; but his dismissal was really produced by his neglecting to further the queen's pet scheme of providing sovereignties in Italy for her sons, who seemed to have little chance of obtaining the throne of Spain. The strong bond of union which had hitherto subsisted between Spain and France was broken, in 1725, by the refusal of the regent of the latter country to fulfil certain matrimonial agreements; but four years afterwards the two countries joined with England and Holland against the emperor, and in 1731 P. took measures to recover the old Spanish possessions in Italy. The war which followed at last satisfied the queen by giving the kingdom of the Two Sicilies to her son Charles (1736), but P., in attempting to obtain still greater advantages over Austria, was led into a war of which he was not destined to see the result. He died at Madrid, July 9, 1746.

PHILIPPE II., better known as **PHILIPPE AUGUSTE**, king of France, was the son of Louis VII. and Alix of Champagne, and was born in August 1165. He was crowned, in 1179, during the life of his father, succeeded him in 1180, and proved one of the greatest monarchs of the Capetian dynasty. His marriage with Isabella of Hainault, a descendant of the Carolingians, established more completely the right of his family to the throne of France. He first made war upon the Count of Flanders, to obtain the districts of Vermandois, Valois, Amienois, and Artois, which belonged to his wife, and, after various fortune, obtained Amienois and part of Vermandois at once, and the rest after the count's death in 1185. By the advice of St Bernard (q. v.) he rigorously punished heretics, despoiled the Jews, absolving their debtors of all obligations, excepting one-fifth, which he transferred to himself; put down with vigour the numerous bands of brigands and priest-haters who devastated the country and burned the churches and monasteries, compelling their chief leader, the Duke of Burgundy, to submit (1186) to his authority—acts which gave him great popularity among his subjects. He sustained the sons of Henry II. of England in their rebellions against their father, and conquered, in conjunction with Richard Cœur-de-Lion, many of the English possessions in France. After the accession (1232) of Richard to the throne, P. and he set out together on the third crusade; but quarrelled while wintering in Sicily, and this dissension continuing, P., after a sojourn of 3½ months in Syria, set out (31st July 1190) on his return to France, after taking a solemn oath to respect the integrity of Richard's dominions; but no sooner had he returned than he entered into an arrangement for the partition of Richard's territories in France with his unworthy brother John. Some acquisitions were made, but Richard's sudden return upset the calculations of the conspirators, and a war immediately commenced between the two monarchs, in which P. had at one and the same time to defend his territories from the English, and the Counts of Champagne, Boulogne, Bretagne, and Hainault, who attacked them on all sides. In order to obtain money, he was obliged to rescind his edicts against the Jews; but the mediation of Pope Innocent put an end (13th January 1199) to a war which was productive of no other result than the exhaustion of the strength of the combatants. Richard of England died within two months after; but war almost immediately recommenced with England, regarding the respective claims of King John of England and his nephew

Arthur of Bretagne to the French heritage of Richard Cœur-de-Lion, which consisted chiefly of Anjou, Maine, and Touraine. Arthur had applied for aid to P., and the French king immediately responded by causing the young duke to be recognised in the above-mentioned provinces; but a quarrel in which he became involved with the pope on account of his having divorced his second wife, Engelburga of Denmark, to marry Agnes of Meran, a Tyrolean princess, compelled him to leave the English in possession for a little time longer. The defeat, capture, and subsequent murder of Arthur, however, again brought him into the field. The English provinces in France were attacked by the combined French and Bretons; Normandy and Poitou, with the three disputed provinces, were annexed to France; and the English dynasty in Bretagne dispossessed by a French one (26th October 1206). During 1211—1214, P. was engaged in a war with King John of England and the Emperor Otho of Germany, who had leagued themselves against him, in which he was on the whole successful. During the rest of his reign, P. was occupied in consolidating his new possessions, and took no part either in the war with the Albigenses or that in England, though his son Louis (q. v.) went to the latter with an army. P. succeeded in establishing the unity of his dominions, and in emancipating the royal authority from the trammels of the papacy and clergy, and vindicated his sovereign authority over the latter as his subjects, irrespective of the pope. His measures, without alienating the great feudal lords, tended firmly to establish his authority over them, and to emancipate the larger towns from their sway. To increase the unity of the kingdom, and strengthen the central power, he established at Paris a chamber of twelve peers, six lay and six ecclesiastical, who almost always supported his plans, even against the court of Rome. Finally, he largely improved and embellished Paris, built many churches and other institutions, and encouraged commercial associations; he also fortified many of the chief towns, including the capital. He died at Mantes, July 14, 1223.

PHILIPPE IV., surnamed *Le Bel* or 'Fair,' king of France, the son of Philippe III., king of France, and Isabella of Aragon, was born at Fontainebleau in 1268, and succeeded his father in 1285. By his marriage with Queen Joanna of Navarre, he obtained Navarre, Champagne, and Brie. For several years he carried on a struggle with the Count of Flanders to obtain possession of that country, and also seized Guienne from the English; but was, in the end, obliged to restore Guienne and Flanders beyond the Lys. The great events of P.'s reign were his war with the papacy and the extermination of the Knights Templars; the former had its origin in the attempt of the king to tax the clergy as well as the laity for the heavy expenses of his numerous wars. Boniface forbade the clergy to submit to taxation, while P., on his side, ordered that neither money nor valuables were to be exported, thus cutting off a main supply of papal revenue; and on the pope's legate insolently reprimanding him, he threw him into prison. P. now called an assembly of states, in which deputies of towns appeared—though not for the first time—and obtained assurance of their support, even in case of excommunication and interdict. Boniface, in turn, assembled a council at Rome (1302), which supported his view, and the celebrated bull, *Unam Sanctam* (q. v.) was issued. P. caused the bull to be publicly burned, and with the consent of the states-general confiscated the property of those prelates who had sided with the pope. Boniface now excommunicated him,

and the king, nothing daunted, went to Rouen his general, William de Nogaret, who seized and imprisoned the pope; and though he was released after a few days by a popular rising, he soon afterwards died. In 1294, P. obtained the elevation of one of his seven cardinals to the papal chair as Clement V., and resided at his residence at Avignon, and giving up the Knights Templars (q.v.). In accordance with this agreement, the Templars were seized (1298-1304), and burned by hundreds, and their wealth appropriated by Philip. The grandmaster, Jacques Molay, was burned 15th March 1314, and when dying he summoned P. to comment within a year and a day, and the pope within forty days, before the judgement-seat of God; strange to say, both the pope and king died within the time mentioned, the latter at Fontenoy, November 22, 1314. P. during his whole reign steadily strove for the suppression of feudalism and the introduction of the French law; but while thus lessening the power of the crown, and also that of the feudal nobles, he incurred popular, which was formerly protection, kind, and popular to the mass of the people, into a hard, avenging, and pitiless taskmaster. During his time the taxes were greatly increased, the Jews persecuted, and their property confiscated; and when these means were found insufficient to satisfy P.'s avarice he caused the currency to be greatly debased; yet he was an able monarch, and under him France was extended almost to its present limits in the north and east.

PHILIPPE VI., or Valois, king of France, was the son of Charles of Valois, younger brother of Philippe IV., and succeeded to the reign of France on the death of Charles IV., the proclamation of a king being deferred on account of the pregnancy of Charles IV.'s widow; but on her giving birth to a daughter, P. caused himself to be crowned king at Reims (May 29, 1298), and assumed royal authority. The right to the throne was denied by Edward III. of England, the grandson of Philippe IV., who declared that females, though excluded by the Salic law, could transmit their rights to their children, and therefore insisted upon the superiority of his own claims. P., however, was not only already crowned king, but he had the support of the people. His wife commenced gloomily, by marching into Flanders to support the count against his rebellious subjects; he wiped out the disgrace of Charles by repulsing the Flemings at Cassel (August 23, 1295). He was obliged to give up Navarre (q.v.) as the Salic law of succession did not apply to it, but he retained Champagne and Brabant, paying for them a considerable annual stipend. P. seems to have had no settled plan of government, and no systematic political action; his acts were regulated by the whim of the hour, and were mostly calculated to gratify his own vanity and love of show. From 1300 to 1329, constant merchandise had been made with the English possession in France; till at last Edward III.'s jealousy was exhausted; and, on August 25, 1327, he formally declared war, and a commencement of this terrible hundred years' contest was made both in Guineas and Flanders; it was carried on languidly for several years, the only prominent incident being the destruction of the French fleet off Sluys (June 24, 1340). In March 1340, P. established the 'gabelle,' or monopoly of salt, a heavy perpetual tax on all mercantile transactions. The constant round of fêtes and tournaments at court was never interrupted, even when the war had well nigh exhausted the wealth of the country, and the money to carry them on was immediately provided by some new tax or fresh confiscation. In 1346, Edward III. landed in Normandy, ravaged the whole country to the environs of Paris, and

totally defeated P. at Crécy (8, 41). A truce was then concluded, but the devoted kingdom had no longer been released from war, then destruction in another and a more terrible form, that of the 'Black Death' (q.v.), threatened it. The wild extravagance of the court was nothing lessened by this visitation; but the financial embarrassments in which P. found himself, compelled him to agree to the passing of a law (1356), which gave to the assembly of the states the sole power of imposing taxes. He received Dauphiné in gift in 1350, purchased Majorca from his unfortunate king, and died August 23, 1350, neither loved nor respected. He was a dissembler of learning, and a bigot.

PHILIPPE LE HARDI (*Philip the Bold*), the founder of the second and last direct house of Burgundy, was the third son of John, king of France, and his wife Joan of Aragon, and was born January 15, 1340. He was present at the battle of Poitiers (1356), and displayed such heroic courage, venturing his own life to save that of his father, as gained for him the sobriquet of *le Hardi*, or 'the Bold.' He shared his father's captivity in England, and on returning to France in 1360, resided in reward of his bravery the duchy of Touraine, and subsequently (1363) also that of Burgundy, being created at the same time the first peer of France. On the accession of his brother, Charles V., to the throne of France, P. had to resign Touraine, but as a compensation, obtained in northern France, the counties of Flanders. In 1365, he commanded the French army opposed to the English, and took from them many of their possessions. In 1369, he exerted himself to suppress the rebellion of the Flemish towns against their count, and succeeded with some of the assistance; but the efforts of some of the popular places, especially Ghent, were possessed with such a love of independence, that after many fruitless attempts to induce them to return to their allegiance, P. raised an army, and inflicted upon them the bloody defeat of Roosebeck (November 27, 1382), leaving 20,000 of them on the field. Flanders, the county of Burgundy, Artois, Reims, and Nevers fell to him by the death of the count in 1384, and the influence of his power, combined with prudence and good management on his part, soon won the affection and esteem of his new subjects. Energy and wisdom characterized his government; arts, manufactures, and commerce were much and judiciously encouraged, and his territory (a kingdom in extent) was one of the best governed in Europe. During the minority and subsequent infirmity of his nephew Charles VI. of France, he was obliged to take the helm of affairs, and preserved the state from anarchy and rebellion within, and the attacks of the English without. He was no less way to repel an attack of the latter on Flanders when he died at the chateau of Hall in Brabant, a little to the south-west of Brussels, April 27, 1404.

PHILIPPE LE BON, i.e., 'the Good,' Duke of Burgundy, the son of Jean 'Sans-pour' by Margaret of Navarre, and grandson of Philippe the Bold, was born at Dijon (the capital of the duchy), June 13, 1396, and on the assassination of his father on the bridge of Montereau at the instigation of the dauphin (afterwards Charles VII.), succeeded to the duchy of Burgundy. Bent on avenging the murder of his father, he entered into an offensive and defensive alliance with Henry V. of England at Arras in 1419, at the same time recognizing him as the rightful regent of France, and heir to the throne after Charles VI.'s death. This agreement, which disregarded the Salic law, was sanctioned by the king, parliament, university, and

PHILIPPEVILLE—PHILIPPINE ISLANDS.

status-general of France by the treaty of Troyes, but the dauphin declined to resign his rights, and took to arms; he was, however, defeated at Crevant (1423) and Verneuil (1424), and driven beyond the Loire. Some disputes with the English prompted P. to conclude a treaty with the king of France in 1429. However, the English, by ceding to P. the province of Champagne, and paying him a large sum of money, restored him to their side. At this time, by becoming heir to Brabant, Holland, Zealand, and the rest of the Low Countries, he was at the head of the most flourishing and powerful realm in Western Europe; but though much more powerful than his superior, the king of France, he preferred to continue in nominal subjection. Smarting under some fresh insults of the English viceroy, and being strongly urged by the pope, he made a final peace (1435) with Charles, who gladly accepted it even on the hard conditions which P. prescribed. The English, in revenge, committed great havoc among the merchant navies of Flanders, which irritated P. to such an extent that he declared war against them, and, in conjunction with the king of France, gradually expelled them from their French possessions. The imposition of taxes, which were necessarily heavy, excited a rebellion, headed, as usual, by the citizens of Ghent, but the duke inflicted upon them a terrible defeat (July 1454), though he wept over a victory bought with the blood of 20,000 of his subjects. The latter part of his reign was filled with trouble caused by the quarrels between Charles VII. and his son, the Dauphin Louis (afterwards Louis XI.), who had fled from his father's court, and sought shelter from P., although, after ascending the throne, far from shewing gratitude, he tried, in the most dishonourable manner, to injure his benefactor. P. died at Bruges, July 15, 1467, deeply lamented by his subjects. Under him, Burgundy was the most wealthy, prosperous, and tranquil state in Europe; its ruler was the most feared and admired sovereign of his time, and his court far surpassed in brilliancy those of his contemporaries. Knights and nobles from all parts of Europe flocked to his jousts and tournaments.

PHILIPPEVILLE, a thriving town and seaport of Algeria, in the province of Constantine, and forty miles north-north-east of the city of that name, on the Gulf of Stora, between Cape Boujaroun and Cape de Fer. It was laid out in 1838 by Marshal Valée, on the ruins of the ancient Russicada, and is one of the prettiest towns in Algeria, and thoroughly French in its character. It is an important entrepôt of the commerce of the east of Algeria, and the country in the vicinity is picturesque and fertile, producing grain, tobacco, cotton, flax, and fruits. It contains numerous public offices, a large hospital and dispensary, Catholic and Protestant churches, public library and museum, theatre, &c. In the vicinity are quarries of the famous Filfila marble. A harbour is at present (1864) in course of construction, and a pier and dock, which afford shelter to small merchant ships in bad weather, have already been completed. There are here several establishments for curing fish, and trade is carried on in grain and in fabrics of native manufacture. P. will be the chief station of the railway for the province of Constantine. Pop. (1864) 12,191.

PHILIPPI, a city of Macedonia. It was named after Philip II. of Macedon, who conquered it from Thrace (up to which time it had been called Crenides, or the 'Place of Fountains'), and enlarged it because of the gold-mines in its neighbourhood. Philip worked the mines so well, that he got from them 1000 talents a year. It is famous on account

of the two battles fought in 42 a.c. between Antony and Octavianus on the one side, and the republicans under Brutus and Cassius on the other. The first engagement was undecided; in the second, 20 days after, the republic finally perished. The apostle Paul founded a Christian church here in 53 a.d., to which one of his epistles is addressed. The ruins of the city still bear the name of Philippi, or Feliba.

PHILIPPIANS, EPISTLE TO THE, one of the latest of the Pauline epistles. It was transmitted from Rome probably about the year 63 a.d., through Epaphroditus, apparently a pastor of the Philippian church, who had been sent to minister to the necessities of the apostle. The Philippian church was looked upon with peculiar tenderness and affection by Paul. It was the first fruits of his evangelisation in Europe; its members were singularly kind towards him; again and again, when he was labouring in other cities, such as Thessalonica and Corinth, they sent him contributions that he might not be burdensome to his new converts, and now they had sent one of the brethren all the way to Rome with presents for him, knowing that he was in bonds, and suspecting—what was in fact the case—that he might be in sore straits for his daily bread. His letter to them is deeply affecting. It contains not so much of doctrinal matter, as of a warm outpouring of his personal feelings towards his friends at Philippi. The historical evidence in favour of the authenticity of the Epistle is so strong, that it could hardly give way to any internal criticism; and the objections of this kind, urged by Baur, Schwegler, and others of the Tübingen school, who regard it as a Gnostic composition of the 2d c., are regarded as preposterous even by many Biblical scholars who do not profess to be orthodox.

PHILIPPICS, originally the three orations of Demosthenes against Philip of Macedon. The name was afterwards applied to Cicero's orations against the ambitious and dangerous designs of Mark Antony. It is now commonly employed to designate any severe and violent invective, whether oral or written.

PHILIPPINE ISLANDS, lie to the north of Borneo and Celebes, in 5° 30'—19° 42' N. lat., and 117° 14'—126° 4' E. long. They are more than 1200 in number, with an area of about 150,000 square miles. Pop. over 5,000,000, three-fourths of whom are subject to Spain, the remainder governed, according to their own laws and customs, by independent native princes.

Luzon, in the north, has an area of 51,300 square miles, and Mindanao, or Magindanao, in the south, fully 25,000. The islands lying between Luzon and Mindanao are called the Bissayas, the largest of which are—Samar, area 13,020 square miles; Mindoro, 12,600; Panay, 11,340; Leyte, 10,080; Negros, 6300; Masbate, 4200; and Zebu, 2552. There are upwards of a thousand lesser islands of which little is known. To the south-west of the Bissayas lies the long, narrow island of Paragon or Palawan, formed of a mountain-chain with low coast-lines, cut with numerous streams, and exceedingly fertile. The forests abound in ebony, log-wood, gum-trees, and bamboo. Area, 8820 square miles. To the north of Luzon lie the Batanes, Bashee, and Babuyan Islands, the two first groups having about 8000 inhabitants, the last unpeopled.

The Sooloo Islands form a long chain from Mindanao to Borneo, having the same mountainous and volcanic structure as the P. I., and all are probably fragments of a submerged continent. Many active volcanoes are scattered through the islands; Mayon, in Luzon, and Buhayan, in Mindanao, often

suffering great devastation. The mountain-slopes are north, and south, and never attain a greater elevation than 7000 feet. The islands have many rivers; the mountains are intersected with deep bays, and there are many lakes in the interior. Earthquakes are frequent and destructive. Manila, the capital, having been nearly destroyed by one in 1863. On February 3, 1893, another terrible earthquake visited the province of Zamboanga, in Mindanao, levelling all the houses to the ground, and causing some of the smaller islands to disappear. The soil is extremely fertile, except where extensive swamps occur. In Mindanao are numerous lakes, which expand during the rainy seasons into inland seas. Rice may be expected from May to December, and from June to November the land is flooded. Violent hurricanes are experienced in the north of Luzon, and most coast of Mindanao. Especially during the seasons of the monsoons, storms of wind, rain, thunder and lightning prevail. The weather is very hot, and heat moderate, from December to May, when the temperature rapidly rises and becomes oppressive, except for a short time after a fall of rain. The fertility of the soil and humid atmosphere produce a richness of vegetation which is constantly suppressed. Grasses and fruit trees together on the trees, and the cultivated fields yield a constant succession of crops.

Lushness forests spread over the P. I., clothing the mountains to their summits; ebony, rose-wood, cedar, sapin-wood, gum trees, &c., being found together and surrounded by the bark-rose or palawan, which attains a length of several hundred feet. The variety of fruit-trees is great, including the orange, citron, bread fruit, mango, guava, guava, banana, rice, rice-apple, &c.; other important products of the vegetable kingdom being the banana, plantain, pine-apple, sugarcane, cotton, tobacco, indigo, coffee, rice, cinnamon, vanilla, cassia, the green nut, ginger, pepper, &c., with rice, wheat, maize, and various other cereals.

Gold is found in riversheds and detrital deposits, being used, in form of dust, as the medium of exchange in Mindanao. Iron is plentiful, and fine malachite, from one to four feet thick, have been found. Copper has long been worked in Luzon. There are also limestone, a fine variegated marble, sulphur in unlimited quantity, quicksilver, vermiculite, and sulphate—the sulphur being found both native and in combination with copper, arsenic, and iron.

Except the wild cat, beasts of prey are unknown. There are oxen, buffaloes, sheep, goats, swine, hogs, squirrels, and a great variety of monkeys. The jaguars swarm with lizards, snakes, and other reptiles; the rivers and lakes with crocodiles. Blue, golden, brownish, white ants, mosquitoes, and locusts are plagues which form a set-off to the beautiful brooks; the brilliant green-bottle (*Eristalis*), the melody of myriads of birds, the turtle doves, pheasants, birds of paradise, and many lovely species of parrots, with which the forests are alive. Hives of wild bees hang from the branches, and alongside of them are the nests of humming birds hanging in the wind.

The rivers along the shores are frequented by the swallows, whose white nest is esteemed by the Chinese a rich delicacy. Some of them are also hunted by multitudes of huts of human skin. Buffaloes are used for tillage and draught; a small house for riding. Fowls are plentiful, and incredible numbers of ducks are artificially hatched. Fish is in great abundance and variety. Mother-of-pearl, coral, amber, and tortoise-shell are important articles of commerce.

The Tagals and Malays are the most numerous

native races. They dwell in the cities and cultivated lowlands; 2,500,000 being converts to Roman Catholicism, and a considerable number, especially of the Malays, Mohammedan. The mountain districts are inhabited by a negro race, who, in features, stature, and savage mode of living, closely resemble the Aborigines of the interior of Papua, and are probably the aborigines driven back behind the islands of the Malays. A few of the negroes are Christians, but they are chiefly idolaters, or without any manifest form of religion, and roaming about in families, without fixed dwelling. The Malays form an influential part of the population by their activity engaging the greatest share of the trade. These are mostly of Chinese fathers and native mothers. Few specialists reside in the P. I., and the leading mercantile houses are English and American. The Chinese exercise various trades and callings, consisting only for a time, and never bringing their wives with them. The principal languages are the Tagalog and Malay. Rice, sweet potatoes, fish, sugar, and fruits form the food of the Tagals and Malays, who usually drink only water, though sometimes drinking in excess wine. Tobacco is used by all. They are gentle, hospitable, fond of dancing and cock-fighting.

With the exception of two Spanish regiments of artillery and a corps of engineers, the army is composed of natives, and consists of seven regiments of infantry and one of cavalry. There is also a body of Spanish militia in Manila, whom the governor, as commander of the naval and land forces, may call out in an emergency. The navy has four steam ships, one brig, six gun boats, and a great number of tubaloes for coast service.

Education is far behind, and similar to what it was in Europe during the middle ages. There is an archbishop of Manila and bishops of New Negros, Nueva Caceres, and Zambo. Religious processions are the pride of the people, and are formed with great parade, thousands of persons carrying wax-candles, &c.

The natives not only build houses, but ships of considerable tonnage. They weave various textile fabrics of silk, cotton, abaca, and very fine shawls and handkerchiefs from the fibre of pine-apple leaves. These are called pinas, and often will for one or two ounces of gold apiece. The pinas are the finest sort, and is only made to order—one for the queen of Spain costing 700 dollars. They work in horn, make silver and gold chains, fine hats and cigar-cases of fibres, and beautiful mats in different colours, ornamented with gold and silver.

The governor-general is appointed by the sovereign of Spain, and resides at Manila. There are also a lieutenant-governor, governors of provinces, and chiefs of municipalities or townships, who are elected yearly. Acting governors reside also at Zamboanga in Mindanao, and Iloilo in Passay. They are appointed for six years by the governor-general.

The revenue amounts to about £2,100,000; and the expenditure, including subsidies to Spain, nearly the same. In 1859 the budget was—revenue £2,085,940; expenditure, £2,177,652. The personal tax produced £401,783, and the government monopolies, of which tobacco is the chief, £1,499,599. To Spain was remitted £216,802. The gross receipts of the tobacco monopoly were £1,002,041, of which 63 per cent. was expended in paying for tobacco, manufacturing it, and other charges, leaving 37 per cent. of clear profit.

The principal exports are sugar, tobacco, cigars, indigo, Manila hemp, or Abaca (p.p.)—of which 35,000 tons are annually exported—coffee, rice, dyewoods, hides, gold dust, and honey-wax. Cotton, woolen, and silk goods, agricultural implements,

watches, jewellery, &c., are imported. British and American merchants enjoy the largest share of the business, the imports to Great Britain being upwards of £1,500,000 sterling yearly, and the exports thither nearly of the same value. There are seven British houses established at Manila, and one at Iloilo in the populous and productive island of Panay, which is the centre of an increasing trade. The total exports and imports of the P. I. have a value of about £6,000,000 yearly.

The Sooloo Islands have a population of 150,000; are governed by a sultan, whose capital is Sung, in 66° 1' N. lat., and 120° 55' 51" E. long., who also rules over the greatest part of Paragoa, the northern corner only being subject to Spain.

Luzon has a population of 2,500,000, one-fifth part being independent; the Bissayas islands, 2,000,000, of whom three-fourths are under Spanish rule. The population of Pasay amounts to 750,000, and that of Zebu to 150,000. Of the numbers in Mindanao nothing is known; the districts of Zamboanga, Misamis, and Caragan, with 100,000 inhabitants, being all that is subject to Spain. The greater part of the island is under the sultan of Mindanao, resident at Selanga, in 7° 9' N. lat. and 124° 38' E. long., who, with his feudatory chiefs, can bring together an army of 100,000 men. He is on friendly terms with the Spaniards. Besides Manila, there are very many large and important cities, especially in Luzon, Panay, and Zebu. The great centres of trade are Manila in Luzon, and Iloilo in Panay.

The P. I. were discovered in 1521 by Magellan, who, after visiting Mindanao, sailed to Zebu, where, taking part with the king in a war, he was wounded, and died at Mactan, 26th April 1521. Some years later the Spanish court sent an expedition under Villabos, who named the islands in honour of the Prince of Asturias, afterwards Philip II. For some time the chief Spanish settlement was on Zebu; but in 1581 Manila was built, and has since continued to be the seat of government.

PHILIPPINS, a Russian sect, so called from the founder, Philip Pustoswiät, under whose leadership they emigrated from Russia in the end of the 17th c., are a branch of the RASKOLNIKS (q. v.). They call themselves Starowerski, or 'Old Faith Men,' because they cling with the utmost tenacity to the old service-books, the old version of the Bible, and the old hymn and prayer-books of the Russo-Greek Church, in the exact form in which these books stood before the revision which they underwent at the hands of the patriarch Nekon in the middle of the 17th century. There are two classes of the Raskolniks—one which recognises popes (or priests); the other, which admits no priest or other clerical functionary. The P. are of the latter class; and they not only themselves refuse all priestly ministrations, but they regard all such ministrations—baptism, marriage, sacraments—as invalid; and they rebaptise all who join their sect from other Russian communities. All their own ministerial offices are discharged by the Starik, or parish elder, who for the time takes the title of pope, and is required to observe celibacy. Among the P. the spirit of fanaticism at times has run to the wildest excesses. They refuse oaths, and decline to enter military service; and having, on account of this, and many other incompatibilities of the system with the Russian practice, encountered much persecution, they resolved to emigrate. Accordingly, in 1700, under the leadership of Philip Pustoswiät, they settled partly in Polish Lithuania, partly afterwards in East Prussia, where they still have several small settlements with churches of their own rite. They are reported to be a peaceable and orderly race. Their principal pursuit is agriculture; and their

thrifty and industrious habits have secured for them the goodwill of the proprietors, as well as of the government.

PHILIPS, AMBROSE, was born in Shropshire in 1675. He studied at St John's College, Cambridge, and took his degree of M.A. in 1700. In 1703 his Pastorals appeared, along with those of Pope, in *Tonson's Miscellany*; and the same year, having gone on a diplomatic mission to Copenhagen, he addressed from thence a 'Poetical Letter' to the Earl of Dorset, which was published, with a warm eulogium from Steele, in the *Tatler*. In 1712, he brought on the stage *The Distressed Mother*, a tragedy adapted from Racine's *Andromaque*, which had great success. He subsequently wrote two other tragedies, but they proved failures. Some translations from Sappho, which appeared in the *Spectator*, added greatly to P.'s reputation, but Addison is believed to have assisted in these classic fragments. Some exaggerated praise of P. having appeared in the *Guardian*, Pope ridiculed his Pastorals in a piece of exquisite irony, which led to a bitter feud between the poets. P. even threatened personal chastisement, and hung up a rod in Button's Coffee-house, but no encounter took place. One of the names fastened upon P. was that of 'Nabby Pamby,' arising from a peculiar style of verse adopted by him in complimentary effusions, consisting of short lines and a sort of infantine simplicity of diction, yet not destitute of grace or melody. The accession of the House of Hanover proved favourable to the poet; he was appointed paymaster, and afterwards a commissioner of the lottery; and going to Ireland as secretary to Archbishop Boulter, he became secretary to the Lord Chancellor, M.P. for Arranagh, and registrar of the Prerogative Court. He died in 1749. P. is somewhat conspicuous in literary history from the friendship of Addison and the enmity of Pope; but his poetry, wanting energy and passion, has fallen out of view.

PHILIPSTOWN, a market and post town (formerly the assize town) of King's County, province of Leinster, Ireland, 47 miles south-west from Dublin. Its charter dates from 1567; and in the reign of James II. it obtained the privilege of sending two members to parliament. This privilege was withdrawn at the Union. It is at present, and has long been a place of hardly any trade and entirely without manufacture, and the town has fallen still more into decay since the withdrawal of the assizes (1838) to the neighbouring and more flourishing town of Tullamore. Pop. in 1861, 918, of whom 830 were Catholics and 88 Protestants.

PHILISTINES (*LXX.*, *Allophuloi*, Strangers), a word either derived from a root *phalasa* (Eth.), to emigrate, wander about, or identified with *Pelasi* (q. v.), or compared by others with *Shif-la* (Heb.), lowlanders; designates a certain population mentioned in the Bible as being in frequent contact with the Jews, and who lived on the coast of the Mediterranean, to the south-west of Judæa, from Ekron towards the Egyptian frontier, bordering principally on the tribes of Dan, Simeon, and Judah. Our information about the origin of the P. is extremely obscure and contradictory. The genealogical table in Genesis (x. 14) counts them among the Egyptian colonies (the 'Casluhim, out of whom came Philistim'); according to Amos ix. 7, Jeremiah xlvii. 4, and Deuteronomy ii. 23, they came from Caphtor. But supposing that the Casluhim were some separate tribe, and yet Caphtorian colonists, the question still remains, whether Caphtor can be identified with Cappadocia in Asia Minor, as the early versions (*LXX.*, *Targ.*, *Pesh.*, *Vulg.*)

leave it; or whether it be Philistia, Cyprus, or the Isle of Crete. The latter opinion seems now the least probable among them. At what time they first immigrated, and driven out the Canaanite inhabitants, the Assyrian is difficult to conjecture. They would appear to have been in the country as early as the time of Abraham; and in the history of Isaac, Abraham, king of Gerar, is distinctly called king of the Philistines. Yet even supposing that in Genesis the country is designated by the name which it bore at a later period, there can yet be no doubt of the people being firmly established at the time of Moses (Exodus xv. 14, 15). Thus the date of their immigration would have to be placed at about 2000 B.C. At the Exodus Moses critically turning an encounter with the warlike colony for his undaunted heart, did not choose the shorter way over a plain through their territory, but preferred the well-known circuitous route. At a later period, however, Joshua, having triumphed over 31 Canaanite princes, also executed the plan of making himself master of the possessions of the P.; but his celebrated conquest of their country for the benefit of the tribe of Judah was never carried out. At this time, they were subject to five princes (Gaza, Ashkelon, Ashdod, Gath, and Ekron). Not before the period of the Judges did they come into open collision with the Israelites; and the strength and importance in which they suddenly appear then, contrast so strangely with their insignificance at the time of the patriarchs, that many theories—a double immigration principally—have been propounded to explain the circumstance. We find them during powerful nations like the Philistines, whom, about 1000 B.C., they forced to transfer their capital to a more secure position on the island of Tyre; or the Egyptians, with whom they engaged in naval war, for at the same time, under Sennacherib III. With the Israelites they were haunted the air of guerrilla raids, sometimes into the very heart of the country. Under Shalmaneser (about 870 B.C.), they were reported, with a host of 200,000; however, about 200 years later, the Israelites were tributary to them, and continued to groan under their yoke, with occasional pauses only, until Sennacherib first commenced to humiliate them. But they were still so powerful at the time of Eli, that they carried away the ark itself. Under Sennacherib, their rule was humiliated by the battle of Mizpah. Saul was constantly engaged in warring off their new encroachments, and at Gilboa, he and his sons fell in a desperate battle against them. At this time, they seem to have returned to their primitive form of a monarchy, limited, however, by a powerful aristocracy, the king's formal title again being 'Abimelech'—'Father king,' as we find it in Genesis. David succeeded in routing them repeatedly; and under Solomon their whole country seems to have been incorporated in the Jewish empire. The internal troubles of Judah emboldened the P. once more to open rebellions. Under Jeroboam, in union with the Ephraim, they invaded Judah, and not only carried away the royal property, but also the soil and the moral children. Pishah, however, recovered the lost ground; he overthrew them, and dismantled some of their most powerful fortresses—Gath, Yabon, and Ashkelon, and created fiefs in different parts of their country. Under Ahas, they rose again, and attacked the fortification of the 'plain' on the south of Judah; and a few years later, renewed their attacks, in league with the Syrians and Assyrians. Hazkiah, in the last years of his reign, subjected their whole country again, by the aid of the Egyptians, whom we find in the possession of five cities. The Assyrians, however, took Ashkelon, under Tartan,

which was retaken again by Sennacherib, after 20 years' siege. About this time, Philistia was recovered by a Egyptian king on their way to Egypt, who pillaged the temple of Venus at Ashkelon. In the terrible struggles for supremacy which raged between the Chaldeans and Egyptians, Philistia was the constant battle ground of both—her fortresses being taken and retaken by each of them in turn; so that the country soon sank into ruin and desolation. Yet a shadow of independence seems to have been left to it, to judge from the tribute which Sennacherib (ix. 3), after the capture, threw against them and Ashkelon, and their paid. In the time of the Maccabees, too, it was a tributary subject, and had to suffer occasionally from the Jews, although some overtures between the two nations were of no great importance. Ptolemy Soter transferred part of the country to Judaea, another part was taken by Alexander the Great; Pompey incorporated some in the cities with Roman Syria; Augustus transferred another portion to Herod; and finally, Caligula, his sister, received a small principality of it, consisting of Jamnia, Ashkelon, and Ashdod. But by this time the name of the country had long been lost in story of Palestine, which designated all the territory between the Lebanon and Egypt.

Of their state of culture, institutions, &c., we know very little indeed. They appear as a civilized, agricultural, commercial, and warlike nation. They traded largely, and there were said to have been much sought after. Their worship was much akin to that of the Phoenicians; a nature-religion, of which Dagon, Asherah, Baalzebub, and Dorothea were the chief deities. Priests and sacrificers attended; their temples were crowded even by people from Asia. They carried their charms about their persons, and their deities had to accompany them to the wars. They do not seem to have practised circumcision. As to their language, so little is known about it, that conjectures seem more than usually vain. Those who take them to have been Semites, conclude that their language too, was Semitic; others, who would identify them with the Pelasgians, differ also respecting their language. Thus much is certain, that their proper names, as they are recorded in the Bible, are mostly Semitic, and that there always remained a difference of dialect between the Hebrew and the Philistine alien.

The name of Philistine is given by German students to all non-students in general, and the citizens of the special university-place in particular.

PHILIP, JAMES, B.A., was born, 22d May 1817, at Aberdeen. At a very early age he gave indication of the talent which has since so distinguished him; and before he had attained his fifteenth year, had painted various pictures showing his feeling for colour. He thus procured an introduction to the late Lord Panmure, by whom he was enabled to go to London to pursue his studies. He began by copying from the Elgin marbles at the British Museum, and after a few months was admitted as a student at the Royal Academy.

All his early subjects were of Scotch character, such as a 'Scotch Fair,' 'Partisan in Scotland,' a 'Scotch Wedding,' 'The Offering,' &c. In the year 1851 he went to Spain in search of health, which he found, and with it a change in the character of his subjects. On his return home he established himself at the head of the painters of the habits and customs of the Spanish people. In 1855 he exhibited at the Royal Academy, 'Life among the Gipsies at Seville.' His pictures for 1854—1855, 'A Letter Writer of Seville,' and 'El Paseo,' were both purchased by Her Majesty the Queen. In 1857, he attained the rank of Associate of the Royal

Academy, and the following year exhibited a most powerful picture of 'Spanish Contrabandistas,' which was purchased by the late Prince Consort, of whom he also painted a portrait the same year for the town-hall of his native city. In 1859, he received the full honour of Royal Academician. His work for exhibition in 1860 was certainly the most difficult he had yet tried, and his success was proportionably great. 'The Marriage of the Princess Royal' was pronounced by both his fellow-artists and the public as a decided success. His next portrait subject (exhibited 1863) was, if possible, a still more difficult task, being the 'House of Commons,' 1860, containing upwards of thirty portraits of the leading members of both sides of the House; in it he was equally successful. However much he excels in portraiture, his heart is more in his Spanish subjects, of which he is understood to have in progress more works (the fruits of his last two visits to Spain) than he can finish in several years.

The characteristics of Mr P.'s style are rich powerful colour, broad light and shade, strong bold outline, and great variety and truthfulness of texture; there is no living artist who has more power over his brush, or whose example has produced a greater effect on the colorists of the present British school.

PHILO JUDÆUS, the *Philosopher* (there being another Jewish Greek writer of this name), was born at Alexandria, about the time of the birth of Christ. Belonging to one of the most wealthy and aristocratic families—his brother was the Alabarch Alexander—he received the most liberal education; and, impelled by a rare zeal for learning, he, at a very early age, had passed the ordinary course of Greek studies which were deemed necessary for one of his station. Although every one of the different free sciences and arts included in the *Encyclopædia*, he says, attracted him like so many beautiful slaves, he yet aimed higher, to embrace the mistress of them all—Philosophy. Metaphysical investigation was the only thing which, according to his own confession, could give him anything like satisfaction or pleasure. The extraordinary brilliancy of his style, which, by his contemporaries, was likened to that of Plato—his rare power of thought and imagination, and an erudition which displayed the most astonishing familiarity with all the works of the classical Greek poets and philosophers, while at the same time it made him an adept in the fields of history, geography, mathematics, astronomy, physiology, natural history, music, &c.—could not but be of vast influence both upon his co-religionists and those beyond the pale of his ancestral creed. He had completely mastered the literature of his nation; but, strange to say, he chiefly knew it, as far as it was Hebrew, from translations. Thus, the Bible was only familiar to him through the Septuagint version, with all its shortcomings. When about 40 years of age, he went to Rome as the advocate of his Alexandrian brethren, who had refused to worship Caligula in obedience to the imperial edict. He has left an account of this embassy, into the result of which we need not enter here. Of his life we know little except what is recorded above, and that he once went to Jerusalem. His second mission to Rome, to the Emperor Claudius, on which occasion he is said to have made the acquaintance of the Apostle Peter, as reported by Eusebius, is doubtful.

The religious and philosophical system of P., however, which is really the thing of most consequence, is most minutely known, and is deserving of the profoundest study, on account of the vast

influence which it has exercised both on the Jewish and Christian world. To understand his system aright, it will be necessary to remember the strange mental atmosphere of his days, which we have endeavoured briefly to sketch in our introduction to Gnostics (q. v.). The Alexandrines had endeavoured to make Judaism palatable to the refined Greeks, by proving it to be identical with the grandest conceptions of their philosophers and poets, and had quite allegorised away its distinctive characteristics. P. was the first man who, although himself to a great extent imbued with allegorising tendencies, made a bold and successful stand against a like evaporation of the revealed religion of his fathers: which, indeed, in many cases had led people to throw off its yoke also outwardly. A most zealous champion of Judaism, his bitterness in rebuking those co-religionists who tried to defend their secret or overt apostasy by scoffing at the Law itself, who were 'impatient of their religious institutions, ever on the look-out for matter of censure and complaint against the laws of religion, who, in excuse of their ungodliness, thoughtlessly argue all manner of objections'—knows no bounds. He cannot understand how Jews, 'destined by divine authority to be the priests and prophets for all mankind,' could be found so utterly blind to the fact, that that which is the position only of a few disciples of a truly genuine philosophy—viz., the knowledge of the Highest, had by law and custom become the inheritance of every individual of their own people; whose real calling, in fact, it was to invoke the blessing of God on mankind, and who, when they offered up sacrifices 'for the people,' offered them up in reality for all men.

To P., the divinity of the Jewish Law is the basis and test of all true philosophy. Although, like his contemporaries, he holds that the greater part of the Pentateuch, both in its historical and legal portions, may be explained allegorically, nay, goes so far even as to call only the Ten Commandments, the fundamental rules of the Jewish theocracy, direct and immediate revelations, while the other parts of the Book are owing to Moses: he yet holds the latter to be the interpreter specially selected by God, to whose dicta in so far also divine veneration and strict obedience are due; and again, although many explanations of a metaphysical nature could be given to single passages, yet their literal meaning must not be tampered with. This literal meaning, according to him, is the essential part, the other explanations are mere speculation—exactly as the Midrash and some Church Fathers hold. Only that allegorical method differed in so far from that of his contemporaries, that to him these interpretations—for which he did not disdain sometimes even to use the numbers symbolically, or to derive Hebrew words from Greek roots, and the like—were not a mere play of fancy, in which he could exercise his powers of imagination, but, to a certain extent, a reality, an inner necessity. He clung to philosophy, as combined with the Law. If the former could be shewn, somehow or other, to be hinted at in the latter, then only he could be that which all his soul yearned to be—viz., the disciple of both: a Greek, with all the refinement of Greek culture; and a Jew—a faithful, pious, religious Jew. Nay, he even urged the necessity of allegory from the twofold reason of the anthropomorphisms current in Scripture and from certain apparent superfluities, repetitions, and the like, which, in a record that emanated from the Deity, must needs have a special meaning of their own, which required investigation and a peculiar interpretation. See MIDRASH, HAGGADA. Yet this fanciful method never for

was somewhat interfered with his real object of painting out how Wisdom acted plainly and unambiguously was based upon the highest ethical principles.

His writings develop his ideas and his system in the two directions indicated. In that division of his writings principally, which looks at the Christian (*Kristenheit*), he allows allegory to take the place of his hands; in that on the Law (*Wesen*), on the other hand, he remains remarkably sober and clear, equalling the Mosaic legislation through-out, as the essence of every other known to him. In a very few instances only he is obliged to find itself, or to alter slightly, by way of allegory, the existing ordinances.

The idea of God is a profoundly religious, not a philosophical one. He alone is the real Good, the Perfect; the world has only an apparent existence, and is the source of all evil. God is said to be imagined as the universal light, which cannot be seen by itself, but which may be known from its rays, that fill the whole world. Being infinite and uncreated, He is not to be compared with any created thing. He has therefore no name, and reveals Himself only in designations expressive of His 'inexpressibility.' He is also named the Place (the eternal *Ort*), because He comprises all space, and there is nothing anywhere outside Him. He is better than Virtue and Knowledge, better than the Beautiful and the Good; *Katholischer*, deeper than the true, more distant than God. Thus, He has, properly speaking, no qualities, or only negative ones. He is the existing Unity or Existence itself (*Ein, or Ue*), compared to the unexpressed *Ue* (the *Ue*), compared to the unexpressed *Ue* (the *Ue*). He is then called 'The Beginning, the Name, the Word, the Eternal Angel.' In this phase of active revelation of God, which is as natural to Him as breathing is to the lion, and cold to the snow, we notice two distinct sides, the Power and the Grace, to which correspond the two names of Elohim and Adonai, used in the Bible. The Power also gives the law, and provides the offender; while the Grace is the beneficent, forgiving, merciful quality. Yet, since there is not to be assumed an immediate influence of God upon the world, their respective nature being so different, that a point of contact cannot be found, an intermediate class of beings had to be created to stand between both, through whom He could act in and upon creation, viz. the spiritual world of those, which are not only 'beings,' or types, in the Platonic sense, but real, active powers, surrounding God like a circle of attendant Kings. They are His messengers, who work His will, and by His Oracles are called good demons; by Moses, angels. There are very many different degrees of perfection among them. Some are immediate messengers, others are the souls of the pious, or the prophets, and the people of Israel, who rose together on to the Delty; others, again, are the heads and chief representatives of the different nations, such as, at least, does not need, since they conceive and acknowledge the Everlasting Word of all beings, Himself. The *Logos* comprises all these intermediate spiritual powers in His own essence. See article below for P.'s views on this part of his system. Man is a microcosm, a little world in himself, a miniature of Logos, through whom he participates in the Delty, or, as Scripture has it, 'he is created in the image of God.' He stands between the higher and lower beings—in the middle of creation. The ethical principles of Man, P. identified with the Mosaic ethics, in which the ideal is based on the moral perfection of man, and man's duty is based on veneration of God, and love and righteousness towards fellow men. P.

holds freely like belief in immortality. Man is immortal by his heavenly nature; but as there are degrees in his divine nature, so there are degrees in his immortality, which only then becomes this name when it has been acquired by an entrance at virtue. There is a vast difference between the more living after death, which is common to all mankind, and the future existence of the perfect ones. Future resurrection and punishment are not taken by him in the ordinary sense of the word. Virtue and sin both have all their rewards within themselves; but the soul, which is 'pre-existing,' having marked its course in the vulgar world, serves this continuation with it in a more intense and exalted manner. Punishment is therefore with God; there is no hell with bodily punishments for souls without a body; and no heaven in the Platonic system. Philo's Mosaic notions are vague in the extreme, and he partly even leaves poets receive scriptural passages alluding to some future happiness as referring to the soul. Yet he indicates his belief in a distant time when some here will arise out of the ruins of the nation, who will gather all the dispersed brethren; and those, purified by long punishments, will themselves form a happy, and most prosperous community, to which all the other nations will be eager to belong.

We have only been able to indicate, in the slightest of outlines, the principal features of P.'s theology and philosophy, without endeavoring to follow any one of the manifold apagogic schemes into which his scattered independent ideas have been pressed. The influence P. has exercised upon Christianity and Judaism in the later writings of which his name occurs as 'Vater der Welt, der Welt, der Welt' is enormous, and the various articles in the course of this work (*Introduction*, *Jews*, *Logos*, *Ue*) dwell more or less upon this point. What he has done for the development of Philosophy, is discussed under that head, and in the article *PLATO, NEO-PLATONISM, &c.* Of the many works left under his name, several have been declared spurious, but in some cases, without much show of reason. His writings are generally brought under three chief divisions, the first of which comprises those of a more general and metaphysical nature, such as, *De Abstractis Universalibus*, *Quid Quibus Probus Liber*, *De Vita Contemplativa*. The second contains those written in defense of his compatriots, *Adversus Marcionem*, *Logos ad Gentes*, *De Nihilitate*. The third and most important is devoted to the interpretation and explanation of Scripture in the philosophical manner indicated, *De Mundi Opibus*, *Logos Abrahamicus* (Lxx) 111; containing also a number of special treatises, *De Circumcisione*, *De Mordacibus*, *De Prophanis Sacerdotibus*, *De Potestate Caini*, *De Genesibus*, &c.; five books *De the History of Abraham*, *De Josepho*, *Vita Moysi*, *De Caritate*, *De Pentateuco*, &c.; to which also belong *De Parthenis Oribas*, *De Virtute* (except *Parthenis*, first published by A. Mai; and certain very doubtful fragments, first discovered in an Armenian translation, such as *De Penitentia* and *De Asinibus*, &c. Many of his works, however, seem irretrievably lost. The *editio princeps* by Turnebus, Paris, 1552; reprinted Geneva, 1613; Paris, 1640; &c. Mangey published a more critical edition (Lond. 1742, 2 vols. 8vo), and Reuter a slightly improved one (Leip. 1828-1830, 9 vols.). An edition of Hübner (1783, &c.) remained incomplete. Another edition was published by Tschirner (1851, &c.). As yet, there are several codices in the Vatican, in Rome, in St. Petersburg, which have never been collated, and which promise, to judge from the few readings known, to furnish an immense

help for that really critical edition, which as yet is a desideratum.—Of the scholars who have written on P., we mention principally Dahl, Bryant, Gfrörer, Creuzer, Grosmann, Wolff, Ritter, Beer, &c. The English translation of P. in 4 vols., forms part of Bohn's *Ecclesiastical Library*.

PHILOLOGY. This word, as a technical name for a branch of knowledge, has gone through various phases of meaning. Originally signifying the love of talk or discourse, and then, in a more restricted sense, the love of philosophical conversation such as is exhibited in the dialogues of Plato, it came, in the later period of Greek literature, to mean the study and knowledge of books, and of the history and other science contained in them. In this sense it passed over to the Romans, under whom the name of philologists was applied to men distinguished for universal learning, more especially to the *grammatici*, whose chief occupation of editing and illustrating the classic poets, naturally led them to this multifarious knowledge; and when Martianus Capella (q. v.) in the 5th c. composed his *Encyclopædia* (q. v.) or curriculum of education, embracing the 'seven liberal arts' (Grammar, Dialectic, Rhetoric, Music, Arithmetic, Geometry, and Astronomy), he designates the collective whole by the name of philology. What is known as the Revival of Literature after the dark ages, is nothing else than the revival of the ancient philology. But when men, instead of looking only at what had been written, began to examine the world for themselves, and enlarge the bounds of science, it became impossible for one man to cultivate the whole round of knowledge, and the term philology was by degrees restricted to a knowledge of the languages, history, laws, &c. of the ancient world (by which the Greek and Roman world was chiefly thought of), or, more narrowly still, to the study merely of the languages—of grammar, criticism, and interpretation. A more complete conception of philology, as an independent branch of knowledge, was that of F. A. Wolf, who assigned as its field all that belongs to the life of the ancient peoples; and the conception is still further extended by Böckh, who makes it almost synonymous with history—its problem being the reproduction of the past; in this sense, the word is applicable to all peoples at all periods of their history, so that we are beginning to have an Indian philology, a German philology, a Slavic philology, no less than a classic philology. The fullest and most systematic exposition of what philology in this sense ought to embrace, has been given by G. Haase in Ersch and Gruber's *Ency.*, 3d sect., vol. xxiii.

Of philology, even in its widest sense, the study of language was always, and necessarily, a fundamental part; and, in the usual sense of the word, it has been the chief part—often nearly the whole. For a long time after the revival of learning, the classic writers were studied chiefly for their language and style, and those of them that did not come up to an imaginary standard of purity were despised and neglected, however valuable they might be for their matter. But although great and even undue attention was thus given to language, it was only as an instrument, as means to an end. The philologist studied a language in order to be able to understand it and use it—to get at the thoughts conveyed in it, or to convey his own thoughts with force and elegance to others. This is the object of the grammars, dictionaries, annotated editions, and criticisms, which constitute the chief part of philological literature. But within recent years, philology has entered upon a new phase, or rather a new study has sprung up alongside of the old. As the naturalist investigates a class of objects not with a view to turn them to use, but to understand

their nature, and classify them; so the new school of philologists examine and compare the structures of the various languages, and arrange them in classes and families, with the ultimate view of arriving at some theory of language in general—its mode of origin and growth. The comparison of the structure of two or more languages is called Comparative Grammar, and the whole of this new branch of study is sometimes designated as Comparative Philology; but it seems better to leave the old field in possession of the old name, and in contradistinction to philology as the practical knowledge of languages, to speak of the study of language as a phenomenon *per se*, as the Science of Language. The German term *Sprachentunde*, and the French *Linguistique*, have more especial reference to the naturalist, or classificatory aspect of the study.

So long as the view prevailed that language was a human invention, anything like a science of it was impossible. According to that view, which was early started, and was especially elaborated and discussed by Locke, Adam Smith, and Dugald Stewart, it was only after men found that their rapidly increasing ideas could be no longer conveyed by gestures of the body and changes of the countenance, that they set about inventing a set of artificial vocal signs, the meaning of which was fixed by mutual agreement. On this theory, there might be a history of the subsequent course of the different languages, but inquiries into the nature and laws of language after the manner of the physical sciences would be absurd. In opposition to the philosophers who attributed the origin of language to human invention, some theologians claimed a divine origin for it, representing the Deity as having created the names of things, and directly taught them to Adam. Both these theories may now be considered as given up by all who are entitled to speak on the subject. Everything, in fact, tends to show that language is a spontaneous product of human nature—a necessary result of man's physical and mental constitution (including his social instincts), as natural to him as to walk, eat, or sleep, and as independent of his will as his stature or the colour of his hair.

Language was an object of speculation among the Greek philosophers; but as was the case with their inquiries into the outward world generally, they began at the wrong end; they speculated on the origin of things before they had examined the things themselves. They knew no language but their own, and all others were indiscriminately classed as 'barbarous' or foreign; they had no test of affinity among tongues except mutual intelligibility. The theories of the modern philosophers of the 18th c. were nearly as baseless; they were mere *a priori* speculations, akin to Burnet's (q. v.) 'theory of the earth,' which was constructed before the strata of the earth's crust had been explored. The great obstruction to the true course of inquiry was the assumption, first made by the Church Fathers, and for a long time unquestioned, that Hebrew was the primitive language of man, and that therefore all languages must be derived from Hebrew. A prodigious amount of learning and labour was wasted during the 17th and 18th centuries, in trying to trace this imaginary connection. Leibnitz was the first to set aside this notion, and to establish the principle that the study of languages must be conducted in the same way as that of the exact sciences, by first collecting as many facts as possible, and then proceeding by inductive reasoning. It was owing to his appeals and exertions that missionaries, travellers, and others, now began making those collections of vocabularies and specimens of languages and dialects which form the *Herbaria*.

of 7 years, of human speech. A valuable *Chrestomathy* in Latin and in six volumes was published in Spain in 1601, by Herrera, a Jesuit missionary. It contains specimens and notices of more than 300 languages, and many of the words which are simply found. A similar work was *Arctius's* *Monarchia* (4 vols. Berlin, 1806-1817), based on the collections of Herrera, and also on the collections which the Spanish government had caused to be made. At some of these efforts, however, although much work was struck out, were there anything like fixed principles of scientific classification. The light that threw order into this chaos rose with the study of Sanskrit (p. v.), first made possible to European scholars by Sir William Jones, Blandford, and other members of the Asiatic Society, founded in Calcutta in 1784. The similarity of Sanskrit to Greek and Latin, especially in the grammatical forms, struck every one with surprise. Sir William Jones declared that 'the philology could connect the Sanskrit, Greek, and Latin without believing them to have sprung from the same source, which perhaps no longer exists.' There is a similar reason, though not quite so forcible, for supposing that both the Finnish and the Celtic had Sanskrit origin with the Sanskrit. The old Persian may be added to the same family.' Butler thus said this relation, which it was soon would involve the ethnological affinities, since, as Douglas Stewart, found that Sanskrit had ever been the language of a people, and held that it was an inheritance of the Brahmins, who had constructed it as the model of the Greek and Latin. By Delgado's work, *On the Language and Manners of the Indians* (1808), although defective and erroneous in point of scholarship, has the merit of boldly connecting the languages of India, China, and Europe in one family group by the comprehensive name of Indo-European. It was this work that called the attention of European scholars to a field of labour which they have since made specially their own.

The successive publications of Bopp (p. v.), beginning in 1816, and culminating in his great work on the conjugation of the Aryan languages, *Vergleichende Grammatik* (Berl. 1833-1835; a 3d ed. revised and enlarged, 3 vols., Berl. 1857; an English translation of it, ed. by W. Bopp, 1845-1850), and, revised, in 1854), treated the new science of Comparative Grammar, and laid a firm and broad foundation for the science of language generally. Concurrent with the labours of Bopp, were those of Pott in his *Etymologische Forschungen über die Aryanische Sprachfamilie*, 2 vols., 1833-1836; 2d ed. 1839, and other works. Not less important, though confined to one stock of the Aryan family, the Tartarian, was the great German *Ursprung der Aryanischen Sprachfamilie*, 4 vols. 1815-1837) of J. Grimm (p. v.). William von Humboldt (p. vi) did much to establish a philosophy of language—the relations and interactions of mind and speech; a department of the subject which has been further cultivated in recent years by Steinthal. The method of investigation, thus invented and perfected in the field of the Aryan language, has been applied to other languages, and considerable progress has been made in grouping the principal varieties of human speech into families, which again fall into subfamilies or branches, according to the different degrees of likeness in the relationship. In establishing these relationships, although a comparison of all resemblances—the numerical, grammatical, and more remote lexical and verbal—may establish a general unity, and render a common origin probable; yet the more just line in the grammatical forms. For the three elements of a language which express the relations of things—case, number, tense—have

now become mere terminations, and lost their original form and independent meaning, they can only be transmitted by tradition; and when the same grammatical forms are found possessed in common by two or more languages, they must be an inheritance from a common ancestor. It follows from this that the 'genealogical' classification, as it is called, cannot be carried out with great safety or rigour except in the case of languages in which grammatical forms had become to some degree fixed before their divergence—in other words, of the inflectional languages. Accordingly, the only few well-defined monoglossical families are the Aryan and the Semitic, which embrace the whole of the languages of the inflectional type.

Besides the division of languages into families bearing traces of a common origin, there is a division into three orders, as they may be called, depending upon a radical difference of structure. Speech as the expression of thought, contains two elements; ideas or conceptions, which constitute the substance or material part; and the relations of these ideas to one another, which constitute the formal part; and the nature of a language depends upon the particular way in which the vocal expression of these two elements is combined. At the foundation of all words lie roots (p. v.), or simple sounds expressive of meaning. Now, some languages, as the Chinese (p. vi), use these roots in their naked form as words, like many syllables, according to the position, serving as nouns, adjective, verb, &c.—e. g., *ta* means great, greatness, to be, or to make great, greatly or very. The relational part of the thought, for the most part, gets its vocal expression, it is only indicated by position, as when *nia*, people, and *ti*, power, are simply put together (*nia ti*) to signify the people's power. Relations not readily indicated by position are expressed in a roundabout way by using additional significant words; thus, *ta* being (being or existing) *is* (man) — *man*; *nia* (growing) *is* (child) — *child*; *ti* with *ti* (they) people power) — with the people's power. Even in such cases, each root preserves its independence, and is left to express its own radical meaning. Languages like the Chinese, whose development has been arrested at this preliminary stage, are called *Monosyllabic* or *Isolating*.

The next stage of development is that of the *Agglutinate* languages, which are by far the most numerous, including the Turanian and American families. In these, the relational part of thought obtains prominent vocal expression by separate roots joined or glued on to the significant roots as terminations. These terminations were originally themselves significant roots, and many of them are still used as separate significant words, although the greater part have sunk down to mere signs of case and other relations. The compound expression thus formed never, however, attains perfect unity; the significant root always remains rigid, unaltered in its sense and unchanged in form, and the termination is felt as something distinct from the body of the word.

Thus, the Finnish declension exhibits a structure of the most mechanical and transparent kind—e. g., *bea*, bear; *bea-ko*, of the bear; *bea-ko*, without bear; *bea-ko-ko*, out of the bear; and so on through fifteen cases. The insertion of the plural suffix, *-i*, gives *bea-ko-i*, of the bears; *bea-ko-i-ko*, without bears; *bea-ko-i-ko-ko*, out of the bears, &c. But this composite mechanical structure reaches its climax—remaining still the whole perfectly transparent—in the Turkish roots. Thus the root *ya* has the indubitable meaning of being, and the int. is *ya-ya*, to live; which then, by the insertion of certain syllables, can take on as many as forty forms or voices—e. g., *ya-ya-ya*, not to live; *ya-ya-ya-ya*,

not to be able to love; *sev-dir-mek*, to cause to love; *sev-dir-ish-mek*, to cause one another to love; *s-v-il-mek*, to be loved; *sev-il-e-me-mek*, not to be able to be loved; &c. Each of these forms, then, runs through a large round of tenses and moods, with their persons and numbers.

The languages of the American Indians are all of this agglutinating type, although they have also got the name Incorporative, or Intercalative, because they run a whole phrase or sentence into one word—e. g., *hoponi*, to wash; *hopocuni*, to wash hands; *hopoaduni*, to wash feet; *ninacagua*, I (ni) eat (*qua*) flesh (*naca*). The Basque language partakes of this character.

It is only in the third or *Inflectional* stage that perfect unity of the two elements is attained. In the Aryan and Semitic tongues, which alone have reached this highest state of development, the significant root and the termination have become blended into one both in effect and form, and phonetic changes have for the most part obliterated the traces of composition. Yet no doubt is felt by philologists that the most highly organised of the inflecting or amalgamating languages began with the radical stage, and passed through the agglutinate. The analytic powers of comparative grammar have succeeded in tracing back the formal elements of the Aryan tongues to original independent words, agglutinated to other words to modify them. See *INFLECTION*. Against this theory it has been urged, that there is no historical instance of a language so changing its type, and passing from one stage to another. But a sufficient account of this phenomenon may be found in the different mental habits and political positions of the peoples (see Max Müller, *Lectures on the Science of Language*, First Series, page 316). Besides, the languages of the lower types do shew a tendency, under favourable circumstances, to produce grammatical forms of the higher kind. Even in Chinese, in some of its modern dialects, something like cases is to be seen; and Finnish and Turkish, in contact with the inflected languages of Europe, are making approaches to the inflectional type.

On the other hand, the inflectional languages had, before the earliest times of which we have any written monuments, entered on the reverse phase—the *analytic*. By the process of phonetic change and decay, the grammatical forms have been gradually becoming obliterated and losing their power, and their place has been supplied by separate words, in the shape of prepositions and auxiliary verbs. See *INFLECTION*.

Connected with these radical differences of type, is one of the higher and more speculative problems of the science—the question as to the common origin of all languages. The inherent and apparently ineffaceable difference of structure in the three orders above described, as well as the absence of all sure marks of genealogical affinity even between the two families of the inflectional type, the Aryan and the Semitic, are considered by some as insuperable objections to the theory of a common origin. But although it may be fruitless to look for extensive identifications of the roots and grammatical forms of the Aryan tongues, even in the oldest forms to which we can trace them, with those of the Semitic, still more with Chinese or Turkish elements; it seems rash and unscientific to affirm that, going back to the radical stage, the development of all could not have begun from a common stock of monosyllabic roots. The wonderful transformations exhibited by language in the course of its known history, seem sufficient ground for maintaining the *possibility* of a common origin. On the other hand, the nature of the case forbids all hope

of ever being able to *prove* it; for the coincidences that occur (e. g., Chinese *fu*, Tibetan *pha*, Lat. and Gr. *pa-ter*, Eng. *fa-ther*; Chin. *mu*, Egyp. *mu*, Lat. and Gr. *ma-ter*, Eng. *mo-ther*), even though they were much more numerous than they are, might well arise from the mind and vocal organs of man being everywhere essentially the same.

Languages, like living organisms, are in a state of continual flux or change, and an essential part of the science consists in investigating the laws according to which these changes take place. It is because there are such laws that a science of language is possible. In tracing words to their origin, and identifying them with words in other languages, we are no longer guided by mere similarity of sound, on the contrary, identity of sound is often a proof that a proposed etymology is wrong. It has been established, for instance, by induction (see GRIMM'S LAW), that *c* in Latin is regularly represented by *h* in Gothic and English; while for Gothic or English *c*, the corresponding letter in Latin is *g*. Accordingly, we readily recognise Latin *corn-u* and English *horn* as cognate words; while a suggestion to connect the English *corn* with *cornu*, is immediately rejected. If *corn* has a representative in Latin, it must begin with *g*, which points out *granum* as the word. *Grain* is not the English representative of *granum*; it is *granum*, borrowed from the Latin through the French. The expert etymologist can often identify with certainty two words, although not a letter remains the same. In simple cases, this is done by every one. Who, for instance, doubts that *Abderdeenshire* *fa*, *filk*, are merely dialectic varieties of Eng. *who*, *which*. Yet the same persons who readily admit such cases, are sceptical when it is proposed, for instance, to identify Fr. *larne*, with Eng. *toe*. The grounds of identification, however, are similar in both instances; the only difference being, that with regard to *larne* and *toe*, they require to be traced historically. No one will dispute that *larne* is a corruption of Lat. *lacrima*; in fact, it can be followed through the successive stages of change. Now we know that the Romans had a peculiarity of letting *d* in some positions degenerate into *t*. Nor is this unaccountable, when we consider that the contact of organs which produces *d*, differs from that which produces *t*, chiefly in being more energetic; a slovenly *d* slides into *t*. Thus the Greek name, Odysseus, became, in the mouth of the Romans, Ulysses; they said *odor* (a smell), but *oleo* (I smell); and, instead of *impedimentum*, *delicare*, we sometimes find *impelimentum*, *delicare*. These and other instances would warrant us to conclude that *lacrima* was a corruption of *dacrima* (corresponding to Gr. *dakru*), even if we had not the express statement of Festus that *dacrima* was the older form. After this there is no difficulty in recognising *dacri*, or *dakru*, as identical with Gothic *tagr*, Eng. *tear*.

In order to give a rational account of the phonetic changes now exemplified, the nature of articulate sounds, and of the organs that produce them, must be carefully investigated. The most valuable contributions, in English, to this important preliminary branch of the study (called *Phonetics*), are those of Mr Alex. J. Ellis. See *PHONETIC WRITING*. An admirable *résumé* of the subject, with diagrams of the organs of voice in the position of pronouncing the different articulations, is given in the second series of Max Müller's *Lectures on the Science of Language* (1864), where the best recent works on phonetics are noted.

The transformations that words exhibit, as they are traced down the stream of history, are of the nature of phonetic decay, and are due to a natural

ability to communicate muscular energy by producing two syllables in one. The dropping of vowels, the shortening of words by internal stress and elision (cf. *pare*, from Lat. *parere*; *par*, from A. S. *feger*; *stronger*, from old Fr. *strongier*, Lat. *strongior*), are all owing to the action of this force, and the uniformity observable among such changes, can be explained on physiological principles. Palatal elision is not so easily accounted for; it is difficult to say why *marvellous*—as in the case of the Aryan family, or of the nations speaking Romance tongues—should have given such different forms to the same word of primitive roots; why, e. g., *for*, *poetic*, *land*, *good*, *new*, should be in Lat. *quodam*, *poeta*, *terra*. What shall I think it necessary to go back to a time when many of the articulations were not yet sharply defined; and he speaks in illustration, to the confusion children make between such sounds as *ad* and *at*; and, what is still more in point, to the analogy presented by languages like the Fijian. In the language of the Sandwich Islands, the two consonants *k* and *t*, run into one another; and it seems impossible for a foreigner to say whether what he hears is a guttural or a dental. The same word is written by Protestant missionaries with *k*, by French with *t*. It takes months of patient labour to teach a Hawaiian youth the difference between *k* and *t*, *g* and *d*, *t* and *k*. . . . If children started to grow up from the Hawaiian Islands, the same which took place thousands of years ago, when the Hindus, the Greeks, and Romans left their common home (see Aryan), would take place again. One colony would substitute the infantile, half-guttural, half-dental *guttural* into a pure guttural; another, into a pure dental; a third, into a dental! Much light is thrown on this question by those phonetic particularities—those dissimiles and prohibitions of assimilation which characterize whole tribes and nations, as they often do individuals. They may now be suggested, perhaps, in the dissimilarity of potential consonants (a living patriarch might produce a tribe of *g*-men, without their inheriting the original defect which caused the *g* in him), or in a common habit of the organs of speech produced by external circumstances; but once established, they are very persistent and influential. The Malays, and several other American tribes, have *g*, *k*, *re*, *j*, *v*, or *w*; they never articulate with these lips. In Chinese, there is no *d*; *r* is also wanting; and as the habit of the language requires a vowel after every consonant, the nearest approach they can make to the sound of *Christ* is *Ki-tse-ze-tse*. An analogous habit of articulation transforms the English word *gold* in the mouth of a Kafir into *gawle*. On this principle can be explained the *li* *quere*, from Lat. *quere*; *shidie* or *shidie*, from *shidie*; *sele* *lante*, from *schola*, &c. In the Celtic tongue, an initial *s* with a resonant after it was an unwanted combination; when it would have occurred, a vowel was always prefixed; and on adopting the Latin language, the Celtic people copied their old habit of pronunciation with them. The effects upon a language of those coming in contact with another, are important elements in its history. (See ENGLISH LITERATURE AND LITERATURE.)

The positive part of the science of language being pushed inquiry back, until it arrives at unsolvable roots that admit of no further analysis, there stops, as at the legitimate boundary of its power. It assumes the existence of a certain class of words or primary matter, and merely connects itself with how and of this matter the structure,

as we know it, had been built or has grown up. But a question yet remains, which, although it can never receive but a conjectural answer, has a wonderful fascination for the speculative mind, and was, in fact, the question with which all inquiries into language began; the question, namely: How did language take a beginning at all? How came this primitive material of language, these significant roots, into existence? The answer may be thus conceived: The spark is a necessity of man's rational and emotional nature; he speaks because he thinks and feels. When the mind receives an impression or intuition, by an instinctive impulse of the nature of reflex action, some outward expression—a gesture or vocal sound—breaks forth, which by association becomes a sign or symbol, to the individual and to his associates, of the impression or idea that gave it birth. Associated at first with individual impressions and objects, these sounds, by the process of abstraction, which is pre-eminently a human faculty, would gradually come to represent more generalised impressions—would become words, as distinguished from mere animal sounds. The necessity of words to think is so much insisted on by speculators on this subject, as being the motive-power in the generation of language, and as such it is true that, without language, thought would advance but little, if at all, beyond what is manifested by the brutes. But when they argue as if this necessity of having his ideas objectively depicted, in order to exercise his own reason, would impel an individual man to construct a language for his own use, they make the unwarranted assumption that, under any circumstances, even though he grew up from infancy in solitude, the thinking powers of a human being must necessarily develop themselves. The necessarily few facts that bear on the case look the other way. Kaepfer Hauser (i. v.), instead of elaborating a system of symbols of thought for himself, had forgotten what he had once possessed; his faculties of thought and of speech seem to have been simultaneously arrested. Observation seems to favour the opinion, that man is solitary—if he could exist in solitude—would be as mute as the lower animals. The social nature of man helped to give birth to the germs of speech, no less than his rational nature; an instinctive desire to give a sensible sign of his impressions to his fellows, was perhaps the primary impulse; the aid thus given to his own thinking powers, a secondary result. Be this as it may, it seems reasonable to assume, as it has been well put by Steinthal, that 'at the origin of humanity, the soul and the body were in such mutual dependence, that all the emotions of the soul had their echo in the body, principally in the organs of respiration and the voice. This sympathy of soul and body, still found in the infant and the savage, was intimate and fruitful in the primitive man; each intuition woke in him an accent or a sound.'—Barrow, *Origin of Language*.

Were these sounds, then, guided by chance or caprice? or if not, what determined particular articulations to be associated with particular ideas or ideas? Any mystic innate correspondence between sounds and things is not of the question; but what more reasonable than to suppose that the natural sounds emitted by so many things, animate and inanimate, should suggest the character of the articulations which the ideas of the things called forth—not so as to produce exact imitations, which it is not of the nature of articulate sounds to be, but such resemblances as would suffice for association. See *ONOMATOPOEIA*. In the case of ideas unconnected with any natural sound, names would readily be suggested in many cases by analogies, real or fancied, with things that were attended by

sounds. We can see, again, a physiological fitness in the articulation *sta*, to stand; with the idea of stability, still more with the attitude, the organs involuntarily assume the position with which this syllable is emitted. Similar instances might be multiplied. We are not to suppose that the same thing would suggest the same sound to all, or even to the same individual at all times. The language-making faculty in the flush of its spring would throw out a multitude of names for the same thing (synonyms), as well as apply the same name to many different things (homonyms); but by a process of natural elimination, those only would survive that were felt best to answer the purposes of speech. The abstracting faculty would also soon dissociate them from the concrete individual objects that first suggested them, and convert them into symbols of the prominent attributes of whole classes. It is these generalised names, syllables significant of such general simple notions as seeing, moving, running, shining, striking, cutting, or being sharp, that, by a kind of inverse process, became the roots of language as it now exists. A syllable expressive of a single prominent attribute forms the foundation of the names of a whole class of objects, the specific differences being marked by other significant syllables joined on to it. See *Roots*. In some such way, by the unconscious working of man's intellectual nature, we may conceive language to have grown out of the exclamatory or interjectional stage into the rational structure that we now admire. This theory of the origin of roots, together with the constant operation of phonetic change, accounts for the absence of all traces of onomatopoeia in the great bulk of the words of a language, and seems to meet the objections of Max Müller and other philologists to the onomatopoeic theory.

With regard to these primary or radical words it is only necessary to observe here that they are all significant of sensible or physical ideas, and expressions for immaterial conceptions are derived from them by metaphor. How, from a comparatively few roots of this kind, the vocabulary of the richest language may grow, is further illustrated in the article *Root*.

Another speculative question regards the length of time that language must have taken to advance from the rudimentary stage to the state in which it is found in the earliest records. Bunsen assigns 20,000 years as the lowest limit; but it is evident that the same uncertainty must always rest on this question as on the corresponding one in geology.

Separate points of philology will be found treated under a variety of heads. See—besides the articles already referred to—*ALPHABET*; the several letters, *A, B, &c.*; *GENITIVE*; *NOUN*; *ADVERB*; *PRONOUN*; *DIALECT*; *PERSIAN LANGUAGE AND LITERATURE*; *SEMITIC LANGUAGES*; &c.

The literature of the new science of language is already rich; but much of it is scattered through the transactions of societies and periodicals. Of separate works of a comprehensive kind, in addition to those already named, we may mention, in German, Schleicher, *Die Sprachen Europas* (Bonn, 1850), and *Vergleichende Grammatik der Indo-Ger. Sprachen* (2 vols. Weimar, 1861); J. Grimm, *Ueber den Ursprung der Sprache* (Ber. 1852); Diez, *Etymol. Wörterbuch der Romanischen Sprachen* (2d ed. Bonn, 1861), and *Vergleichende Grammatik der Romanischen Sprachen* (3 vols. Bonn, 1836—1842); translations of both works into English have been published by Williams and Norgate (1864). Heyse, *System der Sprachwissenschaft* (Ber. 1856); Steinthal, *Die Classification der Sprachen* (Ber. 1856); and *Der Ursprung der Sprache* (Ber. 1851). In French,

Renan, *Histoire Générale et Système comparé des Langues Semitiques* (3d ed. Paris, 1863); and *De l'Origine du Langage* (3d ed. Paris, 1863); Pictet, *Les Origines Indo-Européennes* (Paris, 1859).

English scholars were late in entering this field of research. Horne Tooke's (q.v.) *Diversions of Purse*, though a work of genius, and though it has been the means of first awakening in many an interest in the nature of language, was written without sufficient acquaintance with the kindred tongues, and before the true key to the inquiry had been obtained, and therefore few of the results can now be accepted. Among the first important contributions were Prichard's *Eastern Origin of the Celtic Nations* (Oxf. 1831), and the contributions of the Rev. Richard Garnett to the *Quarterly Review* in 1835—1848. Mr Garnett's essays in the *Quarterly*, and his subsequent papers printed in the proceedings of the London Philological Society (in the formation of which, in 1842, he took an active part), have been reprinted under the title of *Philological Essays* (Williams and Norgate, 1859), and are models of linguistic research. The philological articles of the *Penny Cyclopædia* also contributed to popularise the study in England. Of substantive works, the most important, though bearing more directly on the Greek and Latin tongues, are *The New Century* (1839, 3d ed. 1859), and the *Varronianus* (1844) of J. W. Donaldson (q.v.). Winning's *Manual of Comparative Philology* (1858) had previously given a popular sketch of the affinities of the Aryan languages. Latham's *English Language* (1841—several new editions) treats its subject from the historical-comparative point of view, and therefore comes in some degree within our scope. A valuable work of the same kind is Marsh's *Lectures on the English Language* (New York, 1860). Latham's *Elements of Comparative Philology* (1862) gives an elaborate classification of the languages of the world, with numerous specimens; only a small part of the work (36 pages out of 752) is given to the general principles of the science. Farrar, *On the Origin of Language* (1860), chiefly deals with the speculative part of the subject; he brings within small compass the views of the leading investigators on the more interesting points. But above all, the writings of Max Müller (*Comparative Mythology*, in the *Oxford Essays*, 1856; *Lectures on the Science of Language*, 1861; Second Series, 1864) have contributed to make the study of this science take root in Britain.

On the principles of classification above sketched, the chief languages of the earth may be thus arranged:

I. *Monosyllabic or Isolating*.—1. Chinese, the typical language of this order. 2. Tibetan, which shews some beginnings of grammatical forms. 3. The languages of the Eastern Peninsula—Siamese, Anamese, Burman. Japanese and the language of Corea are doubtful.

II. *Agglutinate*.—1. The most important division of this order is the Turanian family, comprising the languages spoken in Asia and Europe (including Oceania), and not included under the Aryan and Semitic families, with the exception of Chinese and its cognate dialects. For the subdivisions of this family, see *TURANIAN LANGUAGES*. 2. *African Languages*.—Some of the languages of Africa are allied to the Semitic family, and were introduced by immigration, such as the dialect of Tigre in Abyssinia (see *ETHIOPIA*), and the Arabic dialects spoken by the Mohammedan population of the coasts, and which have even penetrated deep into the interior. How far the Berber dialects are of Semitic character, is a disputed question; and the same is the case with the language of the Gallas or

Abyssinia. Little has as yet been done in investigating and classifying the native Agglutinate languages of Africa, which have been designated by the common name of Hamitic. The ancient Egyptian, from which the modern Coptic is derived, would seem never to have got beyond the isolating stage (see **HIEROGLYPHICS**). Some of the languages adjoining Egypt are thought to be allied to the Coptic. The negro languages, properly so called, of the Sudan, and of the west coast from the Senegal to the Niger, are exceedingly numerous and widely diverse. The languages to the south of the equator are markedly different from those to the north. They fall, according to some, into two great families, the Congo family on the west, and the Kafir family on the east. The Hottentot language is distinct from both. A valuable contribution has recently been made to the study of part of the field by

Bleek's *Comparative Grammar of the South African Languages*. (1862). 3. *The Languages of the American Indians*.—The native languages of the New World are numbered by many hundreds, all differing totally in their vocabulary, but still agreeing in the peculiar grammatical structure which has given the name of Incorporative (see above). Their area is fast contracting, and they seem destined to disappear.

III. *Inflectional*.—This order consists of two families, so distinct in their grammatical framework that it is impossible to imagine a language of the one family derived from one of the other. It is the peoples speaking these languages that have been the leaders of civilisation within the historic period. The subdivisions of these families will be best understood from the accompanying tables, taken from Max Müller's *Lectures*, First Series.

NO. I.—GENEALOGICAL TABLE OF THE ARYAN FAMILY OF LANGUAGES.

Living Languages.	Dead Languages.	Branches.	Classes.	
Dialects of India, . . . {	Prakrit and Pali—Modern Sanscrit.—Vedic Sanscrit		Indic	Southern Division
the Gipsies, . . .				
Persia, . . .	Paral—Pehlevi—Cuneiform Inscriptions—Zend			
Afghanistan, . . .				
Kurdistan, . . .				Iranic
Bokhara, . . .	Old Armenian			
Armenia, . . .				Celtic
Ossethi, . . .				
Wales, . . .	Cornish	Cymric		
Brittany, . . .				
Scotland, . . .				Gadhelic
Ireland, . . .				
Man, . . .				Italic
Portugal, . . .				
Spain, . . .	Langue d'oc	Lingua vulgaris		Oscan
France, . . .	Langue d'oïl			
Italy, . . .				Latin
Wallachia, . . .				Umbrian
the Grisons, . . .				Illyric
Albania, . . .				
Greece, . . .	Korā { Doric—Æolic			Hellenic
	{ Attic—Ionic			
Lithuania, . . .	Old Prussian		Lettic	Northern Division
Kurland and Livonia, { (Lettish), . . .				
Bulgaria, . . .	Ecclesiastical Slavonic			
Russia (Great, Little, { White Russian), . . .				
Illyria (Slovenian), { Croatian, Servian), . . .			South-East Slavonic	Windic
Poland, . . .				
Bohemian (Slovakian), { Lusatia, . . .	Old Bohemian		West-Slavonic	Teutonic
Germany, . . .	Middle High-German, Old High-German		High-German	
England, . . .	Gothic			
Holland, . . .	Anglo-Saxon			
Friesland, . . .	Old Dutch		Low-German	Old Norse
North of Germany { (Platt-Deutsch), . . .	Old Frisian			
Denmark, . . .	Old Saxon			Scandinavian
Sweden, . . .				
Norway, . . .				
Iceland, . . .				

NO. II.—GENEALOGICAL TABLE OF THE SEMITIC FAMILY OF LANGUAGES.

Living Languages.	Dead Languages.	Classes.	
Dialects of Arabic, . . .	Ethiopic	Arabic	Semitic Family.
Amharic, . . .	Humyaritic Inscriptions	or Southern	
+ . . .			
the Jews, . . .	Biblical Hebrew	Hebraic	
+ . . .	Samaritan Pentateuch (3d c. A. D.)	or Middle	Aramaic
+ . . .	Carthaginian, Phœnician Inscriptions		
+ . . .	Chaldee (Masora, Talmud, Targum, Biblical Chaldee)		Northern
Neo-Syriac, . . .	Syriac Peshito, 2d c. A. D.)		
+ . . .	Cuneiform Inscriptions of Babylon and Nineveh		

PHILOMELA, the name of a personage in Greek legend, who was changed according to one account into a swallow, to another into a nightingale. Modern poets are (or rather were, for it was chiefly an 18th c. fashion) fond of calling the nightingale by its classic name.

PHILOPOMEN, the most illustrious patriot and general who figures in the later history of Greece, belonged to one of the best families of Arcadia, and was born at Megalopolis about 252 B.C. At an early age he lost his father, and was brought up by a wealthy citizen, named Cleander, who took care that he should receive an excellent education. His earliest experiences of war were confined to the border raids of the Arcadians into Laconia; but in 222 B.C., he was one of the defenders of Megalopolis against Cleomenes, king of Sparta. Next year, when the Macedonian king Antigonus marched to the assistance of the Achæans, P. joined him at the head of 1000 horse, and contributed materially to the terrible defeat which the Spartan king received at Sellasia. As tranquillity was now for a short time restored to Greece, P. went abroad to perfect himself in the art of war, and served in Crete with such distinction, that on his return to the Peloponnese, in 210, he was appointed general of the Achæan horse, and at once proceeded to discipline his men in a vigorous and masterly style. In the expedition against Elis (209) he slew the Elean leader, Demophauntus, with his own hand. In 208 he was raised to the highest military dignity then possible in Greece, being elected *strategus* or commander-in-chief of the Achæan League, and in this capacity signalled himself by the great improvements which he effected in the drill, discipline, and armour of the Achæan soldiery. It seemed as if the ancient heroism of the land were reviving. The battle of Mantinea, which took place in the course of the same year, and in which the Spartans were again utterly routed—their general and king, Machanidas, falling by the sword of P. himself—raised him to the pinnacle of fame, and at the Nemean festival which followed he was proclaimed liberator of Greece. His exalted honours did not in the slightest degree disturb the integrity of his character. So great was his influence over his quarrelsome countrymen, that the Macedonian monarch, Philip, began to fear that Greece would regain its independence, and tried to have him secretly assassinated; but the infamous treachery was discovered in time, and its only effect was to endear P. still more to the Achæans. Another of his determined enemies was Nabis, successor of Machanidas in the 'tyranny' of Sparta, but in 201 he inflicted on the latter a severe defeat at Skotetas on the borders of Laconia. During the next few years he was absent in Crete, partly, it would seem, for political reasons, but returned to the Peloponnese in 194 to find matters in a serious condition. A new and dreaded power—the Romans—had appeared, and overthrown both Philip and Nabis, and P. foreboded future mischief to all Greece from these ambitious warriors. On the departure of the consul Flamininus, Nabis recommenced hostilities against the Achæans; P. was once more appointed *strategus* (192); and in a pitched battle nearly annihilated the troops of Nabis, who himself was shortly afterwards killed by the Ætolians. He now exerted all his power to heal the divisions among the Achæans, and to prevent them from affording the Romans a pretext for taking away their independence. In 188, he took a fierce revenge on Sparta for having put a number of his friends to death, and was in consequence strongly censured by the Roman senate, and by Q. Cæcilius Metellus, who was sent out as a commissioner to Greece in 185. Two years later P. (now an old man of 70),

was elected *strategus* for the eighth time. When lying ill of a fever at Argos, news was brought to him that the Messenians had broken their connection with the league; P. instantly rose from his sick bed, hastened at the head of some cavalry to quell the revolt, but was overpowered by numbers, and fell into the hands of Democrates, the leader of the Messenians, who two nights after sent him a cup of poison, which P. drank off and died. The remains of the hero were brought in solemn procession to his native city—the historian Polybius carrying the urn—and statues were erected to his memory by his grateful and repentant countrymen.

PHILOSOPHY. This word meant originally the 'love of knowledge,' and indicated, therefore, a special taste, appetite, or desire, of which the subject-matter was knowledge. At first, man's pursuit of knowledge was subservient to the immediate uses of life; but, in the course of time, an interest was taken in knowing the order of the world, independent of its application to the common utilities. We find that this stage had been reached in Greece especially, about five or six centuries before Christ: at which time the name 'philosophy' took its rise, being attributed to Pythagoras.

The word has had a variety of acceptations, although all pervaded by the one idea of employing the human understanding in the search for increasing knowledge and certainty. It always implies this effort in a distinguished degree, such as only a few persons in any age have ever been able to sustain. The pursuit of knowledge had to become an end in itself, for the mere improvement of practice would not at first have been a sufficient motive for men to undergo the labours of scientific inquiry. Indeed, this improvement was not at all apparent as a consequence of the earliest efforts of speculation. As one celebrated example, the investigation of the properties of the sections of the cone—the ellipse, parabola, and hyperbola—was without any practical use for nearly two thousand years.

As may be readily supposed, the precise aim of philosophy, the statement of what constitutes its end, has varied with the advancement of its study. In modern times, the pursuit of truth has taken a well-defined form, expressed by the name Science (q. v.). But, in the ancient world, this operation was a mixture of speculation, practice, and sentiment—of legitimate inquiry with aspirations after the unattainable; and hence the word 'philosophy,' in its modern employment, often refers to the subjects that have not as yet adopted the strict scientific form. On this view, science is the goal and the grave of philosophy. (See Lewes's *Biographical History of Philosophy*.) It is chiefly with reference to morals, metaphysics, and the human mind generally, that the term is still retained.

The characters that distinguish the highest form of truth are Generality and Certainty or precision; and in proportion as a subject has advanced in these respects, it might be said to have become philosophical, but we now prefer to use the word scientific. The theoretical foundations of a practical subject, as grammar, are sometimes pretentiously called the philosophy of it. So any department of nature or humanity, where explanations by general laws are furnished, is styled 'philosophical'; thus, we have the philosophy of zoology or of history, and a 'philosophical' naturalist or historian.

Again, after definite branches of knowledge have taken a scientific shape, and have been reckoned as distinct 'sciences' (mathematics, &c.) the general principles and views that are supposed to run through the whole, are sometimes called 'philosophy.' This was one of the meanings of the word

is Plato. The great work of Aristotle (*Metaphysics*) opens this consideration.

Professor Barker remarks that philosophy is not truth, but "presumed truth"; that is, it must be first presumed under the forms and processes that govern and establish the highest or scientific knowledge. This is merely another mode of stating that philosophy implies a special procedure for obtaining truth, the ordinary interpreted operations of the surrounding being institutions.

Among the oldest problems of philosophy, we are to reckon also attempts to generalize the universe, or to reduce all nature into some great unity, or common substance or principle. Thales considered Water the primordial and fundamental principle; Anaximander adopted as the foundation of the universe something called by him the Infinite or Indefinite, out of which the various definite substances, air, fire, water, &c., were generated, and to which they were again resolved. Anaximenes assumed Air as the primordial substance, which, by condensation, produced fire and stone, and by condensation, water, earth, and stone. These three philosophers all belonged to the Ionic colony of Milesos. Philosophy was an outgrowth from Ionia to Italy; he gave freedom to the source and foundation of all existing things; the different numbers being representative of different natural properties and powers: thus, Air stood for labour, Air for life, Air. Xenophanes of Kolophon attacked this popular polytheism and propounded an great individual agency everywhere, and identified with the universe, which he would not designate as finite or infinite, as motion or at rest. Parmenides of Elea distinguished between self-existent being, *Eua*, or the Absolute, characterized by extension and duration, and phenomenal nature, the region of inferior existence, or mere opinion. This was the first sketch of what has since been called Ontology, or the science of the *ousion*, or absolute being. Heraclitus of Ephesus maintained an absolute of a totally different character—a principle of incessant change, the negation of all extension and stability, a power of perpetual destruction and recreation. Empedocles took his stand upon the Four Elements, out of which all things were constituted by the action of the opposing principles of love and omity or discord—a poetical representation of attraction and repulsion. Anaxagoras also treated the world as made up of elements, but indefinite in number. In the attraction of each for its own kind, the creative phase was suggested, but excepting 'mind,' no element ever was perfectly pure; the character of each substance being determined by the predominance of the proper element. These elements were called the 'homoiomereis.' Democritus of Apollonia, the last of the series called Ionic philosophers, adhered to a modified form of the tenet of Anaximenes, and Air was the primordial element. The celebrated Atomic theory originated with Leukippos; but is commonly identified with his pupil Democritus of Abdera. The elements of Anaxagoras were acted on by mind, but with Democritus their activity was inherent in themselves from the beginning.

The second problem of External Perception (see Empedocles) was suggested at an early period, and has been always rendered a leading question of philosophy. The first attempt at a solution was an suggestion by Democritus of his atomic hypothesis. He supposed that all things were constantly throwing off masses of themselves, which enter the soul through the pores of the organs of sense. He was aware that this left us in a state of uncertainty, as to whether the images corresponded to the things we knew or sought.

The many difficulties and uncertainties incident to the search for knowledge, could not but be felt by thinkers generally. There was one sect in particular, more especially impressed by their circumstances, and hence called Sceptics, or Pyrrhonians. They were represented in antiquity by Pyrrho. They dwelt on the absence of any sure criterion of truth, and pointed out that what was considered most certain was not free from objections, or counter-arguments.

Philosophical speculation began to take definite shape in the age of Plato and Aristotle, the age of the beginnings of many of the sciences. More especially at this time do we find the distinct formulation of the Philosophy of Reason like, otherwise called Moral and Ethical Philosophy. The questions concerning the end or life, the pursuit of happiness, and man's duties in various relations of life, had been answered by a sort of critical Greek experience, rather than by deep reflection or far-reaching considerations. The dominions of virtue and vice were determined by political society, and connected more or less with religion. There were codes and maxims of conduct, for the most part merely practical. The first approach to a moralizing stigma is found in the poems of Hesiod. He combines a gloomy view of life with much practical wisdom, expounding justice, energy, temperance, and simplicity of life. The 'Nymphs Who Morn,' who belonged to the 6th c. B.C., followed in the same course, and offered a variety of sayings or short maxims of which the most ordinary subjects were 'the inevitability of human things, the brevity of life, the misapprehensions of the poor, the blessing of friendship, the sanctity of an oath, the force of necessity,' &c., together with the simple rules of prudence. The most celebrated saying of this age was the Delphian inscription of unknown authorship, 'Know thyself.' The teaching of the Sophists made another stage in the history of moral philosophy. They opened up discussions on virtue, on justice, on the laws and on happiness; and framed hortatory addresses with a view to moral culture. Socrates then came forward, and instituted a severe logical analysis of the meaning of ethical terms, asking 'What is piety? What is impiety? What is the noble? What the base? What is just? What is temperance? What is madness? What is a state? What constitutes the character of a citizen? What is rule over man? What makes one able to rule?' The rigid search after exact definitions of these terms may be said to constitute a philosophical method in ethics, and hence Socrates is called the first moral philosopher. He gave the impulse to Plato, his successor, who in his turn acted upon Aristotle, and also to the opposing sects of the Cynics and the Epicureans—the one abjecting a hard and ascetic life, and a proud superiority of the individual will to all outward conventions and customs; the other avowing pleasure as the chief good, sitting loose to the intricate duties of the citizen, and in despair of attaining happiness, sliding into apathy. The Stoics and the Epicureans afforded a similar contrast, although differently expressed. The Stoic ideal was a being in whom the natural impulses and desires should be absolutely subjected to highly abstract views of the universe; the Epicurean ideal was a being moving harmoniously according to natural impulses—in short, following nature up to the limits of prudence.

The last phase of ancient philosophy is represented by Neo-Platonism (q. v.), or the Alexandrine school. In the middle ages, speculative philosophy took the form called Scholasticism (q. v.). At the revival of learning, Descartes and Bacon led in opposite directions, the one representing what is called *a priori* philosophizing; the other, *intuition*

(q. v.). From this time, 'philosophy' comes to mean more exclusively the inquiries connected with the mind, as exemplified in the writings of Hobbes, Locke, Leibnitz, Berkeley, Hume, Reid, Kant, &c. The qualified phrase, Natural Philosophy (in the English sense), was applied to a special department of the outer world, as Moral Philosophy was used in connection with mind and the discussion of moral duties. The chief points in the history of modern philosophy will be found under the heads of GERMAN PHILOSOPHY, ECLECTICISM, COMMON SENSE, PERCEPTION, METAPHYSICS, ETHICS; and in the notices of BERKELEY, LOCKE, HUME, REID, KANT, HEGEL, FICHTE, COUSIN, HAMILTON, &c.

PHILOSTRATUS, the Elder, of Lemnos, a famous Greek sophist and rhetorician, was born probably about 170—180 A.D., studied under Proclus at Athens, and finally established himself at Rome, where he became a member of the brilliant and learned circle that gathered round the 'philosophic' Julia Domna, wife of Severus. He was alive, according to Suidas, in the time of the Emperor Philip (244—249). He is the author of a number of works still extant, and not without value on account of their matter, although the style and arrangement are faulty. Among them are a life of Apollonius (q. v.) of Tyana, a description of a collection of paintings at Naples under the title of *Imagines*, biographies of a number of sophists, *Heroica*, Letters, &c. There are complete editions of his works by Morel (Paris, 1608); Olearius (Leip. 1709); and Kayser (Zur. 1844, *et seq.*), of which the last is by far the most correct and critical.—PHILOSTRATUS the Younger, called Philostratus the Lemnian, also a teacher of elocution, was an intimate friend, perhaps a relative of the former, but nothing is known with certainty regarding him.

PHILTHER, PHILTRE (Gr. *philtron*, love-charm, love-potion). A superstitious belief in the efficacy of certain artificial means of inspiring and securing love, seems to have been generally prevalent from very early times; and among the Greeks and Romans (among the latter in the later days of the republic, and under the emperors), love-charms, and especially love-potions, were in continual use. It is not certainly known of what these love-potions were composed—nor can we rely entirely on the details given us on this subject by classic writers, and their commentators in later time—but there is no doubt that certain poisonous or deleterious herbs and drugs were among their chief ingredients, to which other substances, animal as well as vegetable, are said to have been added, coupled with the employment of magic rites. Thessaly had the credit of producing the most potent herbs, and her people were notorious as the most skilful practisers of magic arts, whence the well-known 'Thessala philtre' of Juvenal (vi. 610). These potions were violent and dangerous in operation, and their use resulted often in the weakening of the mental powers, madness, and death, instead of the purpose for which they were intended. Lucretius is said to have been driven mad by a love-potion, and to have died by his own hand in consequence—though the story does not perhaps rest on sufficient authority; and the madness of the Emperor Caligula was attributed by some persons to love-potions given him by his wife Casonia—by which also she is said to have preserved his attachment till the end of his life. In the corrupt and licentious days of the Roman empire, the manufacture of love-charms of all kinds seems to have been carried on as a regular trade; the purchasers, if not the makers of them, being chiefly women. The use of philters seems to have been not unknown during the middle ages; and in the

East, the nurse of superstition of all kinds, belief in the power of love-potions lingers probably down to the present day.

PHLEBENTERISM is a term invented by De Quatrefages to designate an anatomical arrangement, existing, as he supposed, in certain of the nudibranchiate molluscs, and characterised by ramified prolongations of the digestive tube, in virtue of which the digestive apparatus, to a certain extent, supplies the place of a complete circulatory apparatus, and aids in the process of respiration. The researches of Alder and Hancock, and other zoologists, seem, however, to show that in these animals the circulation is as complete as in the gasteropodous molluscs generally, and that these ramified prolongations are of the nature of a rudimentary liver. For further information on this subject, the reader is referred to De Quatrefages's *Rambles of a Naturalist*, vol. i. pp. 348—353.

PHLEBITIS, or INFLAMMATION OF THE VEINS (Gr. *phleps*, a vein), although seldom an original or *idiopathic* disease, is a frequent sequence of wounds, in which case it is termed *traumatic* phlebitis (from the Greek *trauma*, a wound), and is not uncommon after delivery. The disease is indicated by great tenderness and pain along the course of the affected vessel, which feels like a hard knotted cord, and rolls under the fingers. The hardness is, however, sometimes obscured by the swelling of the limb beyond and about the seat of the disorder, partly in consequence of the effusion of serum caused by the obstruction to the return of the venous blood (which thus gives rise to a local dropsy), and partly in consequence of the propagation of the inflammation to the surrounding tissues. The inner surface of the inflamed vessel is supposed to throw out fibrinous fluid, which coagulates in layers, and finally closes the tube. If the vessel is small, the consequences of its obstruction may be of little importance, but when a large vein is affected, the consequences are always dangerous, and may be fatal.

There are two modes of recovery: solution of the coagulated fibrine may take place, and the vessel may again become pervious; or, as is more commonly the case, the obstruction may continue, but a collateral venous circulation may be established, and the circulation thus carried on through a circuitous route. With the return of the circulation—in whichever of these two ways it is accomplished—the swelling subsides, and the patient gradually recovers. If, however, the disease advances, suppuration takes place within the coagulum, and one of two things happens; either abscesses are formed along the vein, or the pus gets into the current of blood and contaminates the circulation, giving rise to the perilous disease known as *Pyæmia* (q. v.). Either condition is dangerous; the latter pre-eminently so.

Phlebitis generally originates in some local injury of a vein, and the inflammation, when once established, is readily propagated along the course of the vessel. Sometimes very slight injuries give rise to it. It occasionally occurs after venesection, especially with a dull lancet, or one soiled by contact with diseased matter. Women are peculiarly liable to this disease after delivery, as the veins of the womb are apt to become inflamed, and to communicate the inflammation to the venous trunks connected with them. See PHLEGMASIA.

There is considerable difference of opinion as to the treatment to be pursued; some high authorities (Dr Wood, for example) recommending 'the very free use of leeches along the affected vein, and that they should be repeated over and over again if the

symptoms of inflammation should passers, the subsequent application of cold infusions, and the liberal use of mercury 'pushed to a moderate effluvia;' while others question the utility of such treatment, and recommend 'rest, warm fomentations, and restitutions, early incision of abscesses, evacuation of bile and blood by one or two doses of calomel, venous to relieve pain and insure quiet of mind and body, and wine, especially if there has been great loss of blood.'—*Doan's Surgery's Part II.* 2nd ed., p. 223. The latter is in most cases the preferable mode of treatment. During convalescence, the patient must be satisfied if the swelling goes down slowly. Time is required for the subjugation of the virus by which the adhesion is to be carried on, and active counter-indication, such as the application of stimulants of saline or mercury, if employed incautiously, frequently does harm by increasing the inflammation. Both care, however, they are useful appliances; and if after giving them a fair trial, much swelling should remain, the practitioner must have recourse to carefully regulated bandaging, and the use of counter-indication.

PHLEBOITIS (Gr. *phlebo*, a vein, and *itis*, a wound) are calcareous concretions formed by the deposition of coagulations in veins, or occasionally extending to the coats of the vessel. They are seldom detected till after death, although cases are so common in which, occurring in subcutaneous veins, they have given rise to external tumours of considerable size.

PHLEBOTOMY. See **BLEEDING**.

PHLEBOTOMY, *in s.*, the flaming, a river of the eastern coast, whose waves rolled torrents of fire. Nothing would grow on its banks and desolate shores. After a course contrary to the Bay of (q. v.), it discharged itself, like the latter stream, into the Lake of Ashes.

PHLEOMYXIA *MYXA DOLENS*, or **MILK-LEGS**, is a disease which is most common in women after parturition, especially if they have lost much blood, but sometimes occurs in unmarried women, and occasionally in males. It usually commences about a week or ten days after delivery, with a feeling of pain in the loins or lower part of the abdomen, whence it extends to the groin and down the thigh and leg. The pain soon becomes very severe, and gradually follows the course of the internal cutaneous and neural nerve of the thigh and of the posterior lateral in the leg. The limb soon begins to swell, and in the course of a couple of days, is sometimes twice its ordinary size, and as the swelling develops itself, the sensation of the pain considerably diminishes. The limb is partly flexed, and for motionless; any movement aggravates the pain. The swelling extends uniformly over the limb, which swells and shines, and hot and firm to the touch, when pressing on pressure. The femoral vein may usually be felt like a hard cord, and this symptom, taken with the swelling, clearly indicates that this disease is essentially *crural phlebitis*. The umbilicus of the cord is interrupted by nodules, arising either from inflamed cellular tissue, or from clots within the vein. Both legs are seldom attacked at the same time, and the left thigh is the most common seat of the disease.

This affection usually terminates favourably, the most symptoms disappearing in about ten days or a fortnight. The swelling, however, often continues for a long time, and sometimes lasts for life. Very different opinions have been held regarding the cause of this disease. At one time, it was considered as the result of metastatic secretion of milk, or, in other words, as due to the milk being of

the breast, and settling in the thigh, and hence the term *milk-leg*. There is now no doubt that the disease is inflammation originating in the veins of the womb, and extending to those of the lower extremity. The treatment is the same as for *Phlebitis* (q. v.) generally. Warm poppy liniments, or leeches, sometimes sprinkled with lanthanum, may be applied externally at the beginning of the attack, after which blood should be drawn with a lancet, composed of one part of lanthanum to two parts of soap liniment, may be applied round the limb in the form of a bandage, applied not so tightly as to restrain pain. If necessary, the bowels must be gently opened with castor oil, and opium given to allay pain and induce sleep.

PHLEUM. See **TRITON** *Ughes*.

PHLOGISTON (Gr. *phlogiston*) was the term employed by Wink, professor at Halle, in his *Synthetic Phlogiston*, 1797, to designate a hypothetical element which, by combining with a body, rendered it combustible, and which consumed combustion by its disengagement, there being left, after its evolution, either an acid or an alkali. In the above-named work, he maintains that the processes of obtaining sulphur from sulphure acid, and of procuring the metals from their earths or oxides, are analogous and consist alike in the solution of his phlogiston. Thus, sulphur, according to the phlogistic theory, which held undivided sway in chemistry until the time of Lavoisier, who substituted for it the theory of oxygenization (1775—1781), and was maintained by a few chemists, especially Priestley, till the beginning of the present century—was composed of sulphuric acid and phlogiston; lead, of the oxide of lead and phlogiston, &c. In consequence of the general adoption of the phlogistic theory, when Priestley, in 1774, discovered oxygen, and when Scheele, a little later, discovered chlorine, the names these chemists gave to their discoveries were *dephlogisticated air* and *dephlogisticated marine acid*. According to modern views, mainly based on Lavoisier's experiments, the addition of oxygen takes place in the formation of acids and of carbon, instead of the subtraction of phlogiston. The question whether the process was, in fact, one of addition or subtraction, was finally decided by the balance, an instrument to which chemistry owes most of its marvellous progress during the last three quarters of a century.

PHLOX, a genus of plants of the natural order *Polymoniaceae*, distinguished by a peduncled calyx, salver-shaped corolla, and unequal filaments. The species are pretty numerous, mostly perennial plants with simple leaves, and mostly natives of North America. A number of species are common in our flower-gardens. This has of late become a favourite genus with florists, and many very fine varieties have been produced.

PHOEBOS, a genus of trees of the natural order *Flacourtiaceae* or *Riaceae*, of which one species, *P. Mundi*, the *Shadjoon* of the Dutch colonists of South Africa, although only 20—30 feet high, attains a diameter of three feet or more, and is very useful for the purposes of wagon-makers and house-carpenters, the wood being hard and fine-grained; another South African species, *P. Edulis*, the *Roosboom* of the colonists, has a hard, heavy, and fine-grained wood, used by cabinet-makers, mill-wrights, &c.

PHOCÆA. See **PORPOISE**.

PHOCÆA, emperor of Constantinople (602—610) was a Cappadocian by birth, and was for some time groom to Phocas, one of the celebrated generals of the Emperor Maurice (q. v.). His brutal cruelty

and Syncellus, Herodotus, Diodorus, Justinus, and others, together with a very few notes scattered throughout the Church Fathers, contain the sum of all our information. Four great periods, however, are clearly distinguishable in the history of ancient Phœnicia. The first would comprise the earliest beginnings and the gradual development of the single states and tribes, from their immigration to the historical time when Sidon began to take the lead, or about 1500 B.C. The second period dates from the conquest of Palestine by the Hebrews. Sidon had then become already the 'first-born of Kanaan,' as Genesis has it, or 'Sidon Rabbah,' the Great Sidon. The flourishing state of its commerce and manufactures appears likewise from several passages in Homer. The silver vase proposed by Achilles as a prize in the funeral games in honour of Patroclus, was a work of the 'skilful Sidonians;' the garment Hecuba offers as a propitiatory gift to Minerva was the work of Sidonian women. The gold-edged silver bowl given to Telemachus by Menelaos, Hephaistos had received from the king of the Sidonians. Ulysses is left on the island of Ithaca by the Phœnicians, who sail away to 'well-peopled Sidonia.' The gradual ascendancy of the rival city of Tyre marks the beginning of the third period, in which P. reaches the height of its power, in which her ships covered all the seas, her commerce embraced the whole earth, and her innumerable colonies flourished far and near. The first historically-recorded item of Tyre's activity is her foundation of Gades, a few years before that of Utica, in 1100 B.C. The reason of the sudden greatness of Tyre is to be found in the defeat of the Sidonians by the king of 'Askalon'—a term probably meant to represent the whole pentapolis of Philistia—about the year 1209; in consequence of which, the principal families of Sidon 'emigrated in their ships to Tyre, which [viz. the island-city] they founded.' In the 11th c., in the time of Samuel, 'the princes of the Tyrians' are already spoken of instead of the Sidonians, as the representatives of Phœnicia. During the reigns of David and Solomon—under Hiram (980–917)—the friendliest relations existed between the two nations: both in the full bloom of their power. Each country needed what the other could supply. Hence their close alliance, which led even to common commercial enterprises in ships built by Solomon, the supercargoes of which belonged to him, while the mariners and pilots were Hiram's.

By this time, Phœnician colonisation had reached its utmost extent. In the space of three centuries (1300–1000), the Phœnicians had covered all the islands and coasts of the Mediterranean with their forts, their factories, and their cities; and their ships, which ploughed the main in all directions, everywhere found their own ports. They had colonised Cyprus, thus commanding the waters of the Levant and the coasts of Syria and Cilicia. Kithion, Amathus (Hamath), Karpasia, Paphos, with its magnificent temple of Ashera, Keryneia, and Lapothos, were some of their principal settlements in those regions. Northward, on the coast of Cilicia, they founded the cities of Myriandros, Tarsos, and Soloi. Migrating to the west, they took possession of Rhodes, Crete (cf. the Myth of Zeus and Europe), Melos, Thera, Oliaros (near Paros), and Cythera, on the coast of the Peloponnese. To the east of the Ægean, we find them at Erythra, and further, as masters of the islands of Samothrace, Lemnos, and Thasos with its wealth of gold mines. The Ægean Sea, with all its islands, being in their hands, they sailed thence further west, to Sicily, where they settled at Motye, on the extreme west point; founded Rus

Melkarth, in the south (Heraclea Minoa); in the north, Machanath (Panormos, Palerino), and further, Melite (Malta) and Gaulos. They owned Caralis (Cagliari) in Sardinia, Minorca, Iviza (Ebusos, Elba; on the opposite, or African coast, Hippo, Utica, Hadrumetum, Leptis, and some minor island states. From Sardinia and Minorca, the indefatigable mariners went still further west—through the Strait of Gibraltar to Tarshish (the California of those days) or Spain, where they founded Gadir or Cadiz, and in the south, Karteja, Malaka, and Abdarach. From here, having colonised well-nigh the whole of the Spanish coast, they went northwards to the tin islands (Scilly Isles), and to Britain herself. And while they thus explored the regions of the Atlantic, their alliance with the Hebrews had permitted them to find the way to the Indies by the Red Sea.

The impulse given to industry and the arts by this almost unparalleled extension of their commercial sphere, was enormous. Originally, exporters or traders only for the wares of Egypt and Assyria, they soon began to manufacture these wares themselves, and drew the whole world into their circle of commerce. As to the early and most extensive commercial intercourse between P. and Greece and her colonies, nothing can be more striking than the circumstance of nearly all the Greek names for the principal objects of oriental commerce being Phœnician, or rather Semitic—identical almost with the terms found in the Old Testament. Thus, of spices—myrrh, cassia, cinnamon, galbanum, narle, aloe, crocus, nitron, balsam, &c.; of jewels and precious stones, sapphire, jasper, smaragdus; of fine materials, and garments, byssus, karpasos, sindon, &c.; musical instruments—nabla, tympanon, sambyke, &c.; oriental plants, vessels, and even writing implements. The wealth of silver, iron, tin, and lead was chiefly got from Tartessus. The descriptions of the abundance of precious metals there verge on the fabulous. Thus, the Phœnicians are supposed to have made even their anchors of silver, when they first discovered the country, not knowing how to stow away all the silver in their vessel. What must have been the state of these mines is clear from the fact, that, even in the Roman time, 40,000 men were constantly employed as miners, and the state received a clear revenue of 20,500 drachms daily. The 'Fortunate Islands,' which, according to Diodorus, they discovered after many days' sailing along the coast of Africa, beyond the Strait of Hercules, and which, to judge from the name *Purpuraria* given to some islands off the coast of Mauritania, would seem to have been the Canaries, yielded them the shell-fish *purpura*, so useful for their dyeing manufactories. Besides their wholesale commerce carried on by fleets and caravans, they also appear to have gone about the interior of Syria and Palestine, retailing their home or foreign produce.

Although the Phœnicians were erroneously believed, by the western tribes, to manufacture all the wares in which they dealt themselves, yet no inconsiderable number of them was really their own work. None of their manufactures, however, stood in so high repute throughout antiquity as the purple dye prepared from the *muricea*, a shell-fish of its coast; and none excelled more in it than the Tyrians. Purple was an almost indispensable luxury of antiquity, particularly in Asia. In temples and palaces for gods and men, purple garments, hangings, curtains, and veils were needed; and Alexander the Great found in Susa alone a store of purple worth 5000 talents. Sidon's principal production was glass—invented there, it was said, by

without, but probably the invention was derived from Egypt, where it was in use long before; the Phœnician glass, however, was always supposed to be the best. The Sidonians knew the use of most of our very commonest—the blue, green, the lapis, and the purple. Hardly less great was the taste of Phœnician metallurgy. Their mining operations in the Lebanon and Taurus, where they dug for copper; in Tharsus, where, according to Herodotus, they discovered a whole mountain in searching for gold, but more particularly in Hama, where at first silver was so abundant, that hardly any labour was required to obtain it—were stupendous; and the scientific description of the mining process contained in Job (xxviii. 1-11) has probably been derived from a sight of Phœnician mining-works. That they well understood how to work the metals thus gained, has been observed already. The art of hammering brass must, indeed, have reached a high perfection to enable Hiram Abi to execute such works for Solomon's Temple as they are described in the Bible. He was very familiar with the art of imitating precious stones, and working glass by means of mobile wheels. To him is further ascribed the pre-eminence in the glyptic and plastic arts; and the artists sent by Hiram to Solomon were skilful workers in gold and silver, in brass, in iron, in purple and in blue, in stone and in beryl, in fine linen, and the engraving of precious stones. Their architecture seems to have been of a Cyclopean nature. Their vessels, originally simple rafts, gradually developed—with the aid of the Lebanon, which afforded inexhaustible supplies of timber, and Cyprus, which possessed all the materials necessary for fitting up a ship, from the keel to the masts—into a three-masted fleet, consisting of round ships, or galleys, for short or coasting voyages; war-ships, or *triremes*, and fifty-masted craft, long in keel, and adapted for rapid sailing or rowing. The internal arrangement of these vessels was perfect, and excited the wonder and admiration of the Greeks, by their being so splendidly adapted also for navigation, freight, and defence. Their extraordinary three years' voyage of discovery, undertaken in the service of Necho, round Africa, going out of the Red Sea, and returning by the way of the Straits of Sicily, is as well known as their voyages in the service of Solomon.

The golden age of P., during which her colonies, her manufactures, and her commerce were in this most brilliant phase, seems to have wound simultaneously almost with that of Judah. As Solomon at the latter, so did Hiram in the former, reach the end of that peace and happiness which had made their countries rich and glorious, as an olive country of that day. According to a fragment preserved in Menander, Hiram was followed by his son Balasacarus, who died after a short reign of seven years, in 940 B.C., and a long series of political calamities and civil wars ensued. The last of Hiram's sons, Phœstus, fell, in 893, by the hands of Ithobaal, the priest of Ashtar, into whose family now passed the kingdom of Tyre. He is the Ithobaal mentioned in Scripture as the father of Isbaal, and father-in-law of Ahab; and a possible coincidence is the simultaneous mention of the three years' drought in Judah (to which an end was put by Elijah's prayer) and in P., where *nead* was obtained by Ithobaal, who seems to have died in the odour of sanctity. It was during the caliginous period that the celebrated Elia, better known as Queen Bido (q. v.), died, together with some of the most aristocratic families of Sidon, in Sidon, where they founded a new city, *Antiochia*—*Antioch*, near the spot of an ancient Sidonian settlement, about 312 A.C. The

fourth and last period of Phœnician history may be dated from the middle of the 5th c., when Sardanapalus, the King of Assyria, invaded P., and besieged Tyre for five years, but without result; and there is every reason to believe that the peace concluded at the end of this period was very favourable to Tyre. But soon afterwards, P. was drawn into the struggle for the supremacy then going between Chaldeans and Egypt, and was conquered by the former power. A further calamity befell P. at the hand of Pharaoh-Apries, who anticipated Nebuchadnezzar's intended attack on Egypt by destroying the Phœnician fleet, conquering the country, and pillaging it. These calamities produced a series of internal troubles, in consequence of which the constitution was constantly changed; and we have now of a series of kings, and novel provisional *soverains*, all their respective reigns, however, being of very brief duration. From that time forward, and even before the special histories of Sidon and Tyre, which alternately possessed themselves of the hegemony of Phœnicia, constitute also the history of the country itself, and to these two cities we refer for what momentary events took place in the later days of the once mighty empire. The battle on the Issus terminated even the shadow of P.'s independent existence, and it shared the fate of Alexander's vast empire. In 65 B.C. it became, under Roman dominion, part of Syria, and has since shared her fate for good or evil. See Syria, Sidon, Tyre, Carthage.

Religion.—With regard to the Religion of the Phœnicians, its real character has as yet been imperfectly explained. Deprived of all original and direct information on the subject, we have to cull what scanty notices we may from the works of Greek and Latin writers, or to gather knowledge from some vague allusions contained in the Bible. Not a scrap of native literature has been allowed to survive; and the supposed extracts from a Greek version by Philo of Hierapolis, Phœnician works, which we find in Eusebius—*historia* our chief source of information—must be used with more than an ordinary degree of caution. See HEBREW LITERATURE. We shall therefore, without entering into futile speculations, confine ourselves to a few general and well ascertained facts; promising, however, that Phœnician theology is far from being a hopeless province, whatever it may appear now. Excavations are on foot in all directions, both in the mother-country and in the colonies, and new discoveries are being brought to light constantly.

The religion of the Phœnicians was, like all ancient Semitic religions—except that of the Hebrews—a kind of pantheistic worship of nature. While Monotheism, with the descendants of Abraham, assumed a supreme power within nature, which, according to its own free will, creates and destroys, the rest of the East assumed a Dualism: two deities, a male and a female; or two highest deities, one of whom begets, and has the power in destiny, and the other conceives and bears. These two supreme beings were sometimes merged in one deity, with male and female attributes, which spread out into immense ramifications: representatives now of the general powers of nature, now of the particular phenomena in nature, or the life of men. They had deities who ruled over the stars, the elements, the seasons; over special localities, or over certain phases of life. No nation of antiquity perhaps possessed a more confused pantheon than the Phœnicians; a circumstance easily explained by their peculiar position and relations. Consisting originally of a variety of tribes, each of whom had had their own special deities—although the supreme

Numen, or the principle of their chief Deity, was probably the same with all—those Phœnicians who dwelt in the north differed in some respects, such as the names and attributes of certain gods, from those of the south. Besides this, it must not be forgotten that the period of Phœnician history ranges over 2000 years, and their political career, as well as their commerce, brought them in close and constant contact with nearly all the civilised nations of the then known world; and being both superstitious (as sailors and traders are prone to be), and possessed of an adaptability to which partly they owed their success in other respects, they easily, if not greedily, received into their wide pantheon those who, albeit the special national gods of others, or because of this very reason, could either harm or benefit them. It may be also that a certain easy nonchalance about these things, such as the wealthy and aristocratic classes displayed in ancient Rome and elsewhere, and the interest of the priests, who received very considerable tithes of every sacrifice (oddly enough, our information on that point leaves nothing to be desired), went hand in hand to favour the gradual introduction of as many gods and goddesses as pleased the herd. Their proper divisions, however, their real names and derivations, and the history and time of their nationalisation, are things which will for ever continue to puzzle investigators.

Setting aside such more or less vague and undefined names of deities as were common to the whole Semitic stock, and as they are found in the Hebrew records—like *El* (Mighty One), or (in plural) *Elohim*; *Olonim* [*Elyon*] (the Most High); *Adon* (Lord); *Melch* [*Moloch*] (King); &c.—we find in the first rank of gods (of Tyre and Sidon) *Baal* (q. v.) and *Astarte* (q. v.). *Baal* again occurs in two different characters, as it were—as *Baalsamin* (Lord of Heavens), the highest god ruling over the Universe, the Zeus Olympios, and Jupiter Optimus Maximus; and as *Baal Melkarth*, the special national numen. *Baalsamin* is originally identical with the Babylonian *Bel* or *Baal*. The third supreme Tyrian goddess was *Astarte*, worshipped as the very counterpart of the Sidonian *Astarte*. While the latter was considered a pure virgin, whose emblem was the moon, the former (the biblical *Ashera*) was prostituted (as Venus, goddess and planet) by prostitution. The Tyrian *Astarte* was principally known under the name of *Tanis* (q. v.), the Assyro-Persian *Tanis*, and was married to *Baalsamin*, and also to *Adonis*, and bore altogether the character of a goddess who delighted in chastity.

The principal deities of Northern P.—the non-Sidonian tribes—consisted of a different trias—*El*, *Baal*, and *Adonis*. The first was the supposed founder of the two oldest Phœnician cities of Byblus and Berytus, and corresponded to (being originally, perhaps, identical with) both *Baalsamin*, as the highest deity, and *Melkarth*, as the special god of Tyre. *Baal*, *Beltis* (My Lady—Aphrodite), worshipped at Byblus, Berytus, Aphaka, Arke (Architis), &c., was joined to *Adonis* (q. v.), whose cultus had been imported from Assyria, and is therefore unknown in the more ancient Phœnician colonies, in Africa and Spain. Byblus called him *Adonis Ganas*, or *Ganan* (perhaps *Gaavan*, the Exalted), near Byblus, we find him worshipped as *Elyon* (the Highest); as *Esmun* in Berytus, and perhaps also under the name of *Memnon*, at Apamea, where an annual mourning-festival was celebrated in his honour; further, near the river *Bandas* at Paltos; and at the river *Belus*. As *Serach* (the Brilliant) in Phœnician, and *Kharush* (the Sun) in Persian, he appears to have had some relation to the star-and-planet worship which became, under Assyrian

influence, a prominent feature of the Phœnician religion.

Besides these more or less localised gods and goddesses (*Dii Majores*), a certain number of deities—states and country deities—were worshipped in common by all Phœnician states. They were called the Children of *Sadik* (the Just), or the Children, or the *Pataki* (Descendants of *Phtha*), or the eight *Kabiri* (Strong Ones). They are the maritime gods, and their images were placed on the prows of Phœnician ships. As protectors of navigation, they are identified with the *Dioscuri*; and again, as representatives of heat, breath, and life, they received the names of *Lares* and *Penates*. Their individual names are not generally mentioned; they seem (cf. *Esmun* = eighth) to have been merely counted. Their mode of worship was most mysterious—as indeed some of the earliest mysteries were closely connected with it.

Besides these, they also worshipped certain phenomena, personified attributes, and qualities. Their planetary divinities were the Sun and his four horses—to whose worship belongs, among others, to a certain extent the annual festival of the Resurrection of the (Tyrian) *Herakles*, under the emblem of a column in the form of a rising flame (*Chaman*); the Moon with her chariot drawn by white bulls; the planet *Mars* (*Aziz* or *Nergal*); *Jupiter* (*Kochab* *Baal*); *Venus* (*Astoret* *Naamah* = lovely *Astarte*), with her voluptuous cultus; and *Saturnus* (*Moloch*, *Kronos*), the evil principle. The elements were revered either in conjunction with certain deities or on their own account. The water, to which sacrifices were offered both in the shape of human beings and animals or fruits, was hallowed in all its shapes—as the sea, as rivers, fountains, lakes—by which people took their most solemn oaths: the fire, in connection with the oldest deity of P.; the light (*Moloch*); the air and the winds: the earth and all its plants, its forests, and glens, and trees, and more especially its mountains, as the 'symbols of the High Ones,' or as 'Faces of God,' such as Mount *Carmel*, *Lebanon*, *Antilibanus*, and others. Of animal-worship we have only small traces.

Abstract notions and ideas were not forgotten. The Year and the Months, Day and Night, *Aurora* (*Lilith*), Age and Youth, Art and Love, had their altars. Nor were certain professions and trades without their visible patrons. Thus, there are gods of agriculture and horticulture, like *Dagon*, the god of grain; a *Dionysos*, whose Phœnician name is lost, as the god of wine-growers; a god who is the numen of fruit-growing, of pisciculture, of mines, &c. Chthonian gods are not wanting. The god of Death—the king of the lower regions—is *Muth* = Death (*Pluto*), who is represented as a small child. His reign was shared by a goddess whose name is vaguely known as *Eloiti* (My Goddess), and who is occasionally identified with *Astarte*, *Dido*, *Anna*, *Persephone*, *Europa*, and a great many other deities.

We have already touched upon the mode of worship of the Phœnicians, and the places chiefly selected for their rites. Mountains, heights, rivers, lakes, fountains, meadows, glens, were, as we said, the favourite habitations of the gods. But the Phœnicians were also amongst the first who erected temples. These were generally divided in two parts, containing the sacred arks (the mystic cists of the Greeks); and the chariots upon which the sacred objects were at times carried about. Not being intended to be prayer-houses, but as dwelling-places for special gods, they were rather small, and did not even contain the altar upon which the sacrifices were offered. This generally stood at the entrance of the temple, and around it the

piests and household deities in their service. Two wells and an everlasting fire were the indispensable conditions of a sanctuary. The sacrifices themselves, as far as they consisted of animals, were most analogous to those of the Jews; but the P. also offered up human sacrifices—chiefly first-born male children, as that which the Egyptians held dearest—chiefly to Baalshamin, Baal Hamon, and Astarte. Such human sacrifices, or human offerings took place annually at the great festivals of expiation, and further on extraordinary occasions, at the beginning of important enterprises, such as a campaign, and in great necessities; it was to expiate by one sacrifice the sin of all. The same lawlessness which found the gods best pleased by the offering up of what was most precious, led the Phenician women, like the Babylonian, to sacrifice their husbands in honour of Astarte, on certain occasions, so that certain hamulets became hotbeds of prostitution. Circumcision—another kind of sacrifice—was not common among all the Phenicians, it being a rite principally sacred to El, the god at Byblos and Tyre.

All festivals and pilgrimages in general, we have spoken under *PHENICIA, GREEK RELIGION, &c.*, and what has been observed there respecting their character in Polytheism (their being to a great extent connected with the myths, dreams, resurrections, and other personal phases of special deities), holds good here. No doubt, these festivals, like those of the Hebrews, and all other ancient nations, had, beside their religious, also their political and commercial significance; and P. was more particularly, by the constant position she held in the world's trade, a place towards which flocked, on solemn occasions, pilgrims from all parts of Asia and Africa. 'Festival Companies,' as they were called, were despatched thither from Syria, Arabia, Babylonia, Cappadocia, Cilicia, Egypt, Armenia; nay, from India, Ethiopia, Persia, and Scythia; and we still the 4th c. A.D. did these pilgrimages to P. come undiminished. One festival, is entirely peculiar to Tyre, and strangely enough, it is still celebrated by the present inhabitants of Sur-via, the 'Washing of the Land-water with the Sea-water.' On these occasions, the people walk in procession to the wall near the town gate, and pour some pails of sea-water into it, in order to render it clear and sweet again for a long time.

It would be vain to try, with our scanty and unelaborated sources, to gain a deeper insight into the ideas attached to the names, attributes, and modes of worship of the deities mentioned, or to speculate upon their moral influence upon the people of Phenicia. That there were pre-eminently, as we saw, that arts and manufactures flourished among them, more than among any other ancient nation, that they knew how to turn science into money; that they were, in fact, shrewd men of business—all this we know, but little more. Atheists or Polytheists, whichever they must be called in the modern sense of those words, it is extremely doubtful, whether they, any more than the bulk of the Hebrews before the Exile, believed, as a body, in immortality. What was their influence upon Greece, Rome, the whole ancient and modern world, in the province of religious thought, we shall never have any means fully to ascertain. Comparative Mythology, has a vast field to explore in this direction.

Phenician Language and Literature.—With the exception of Greek and Latin, no language was so widely known and spoken throughout antiquity as the Phenician; and monuments of it have been found, and continue to be found, almost all over the ancient world. We can only vaguely speculate as to early history and its various phases, so long

as our materials yield so little information on that point. Its decline seems to date from the 6th c. A.D., when Aramaic came to be an overwhelming number. Finally, the close contact with, and the everywhere preponderating influence of the Greeks, superseded—scarcely after Alexander's time—the ancient language almost completely; and even some with Phenician legends never got later than the 2d c. B.C.—an important Phenician literature seems to have been extant as late as the 1st c. A.D., but it has disappeared from the face of the earth. After the second half of the 2d c., the language had reached extreme in the country itself, and Jerome, who lived in Palestine, mentions the Phenian had never the Phenician. In the west, it survived in a much later period. In Mauritania and Numidia, it remained, in a corrupted form, the reigning language as late as the 4th c. A.D.; and Augustine draws his explanations of Scripture from the Phenician in the 5th century. There was a translation of the whole Bible into Phenian made for the use of the Pense Christians; and in and near Tripoli and Banchon, it was the language of the common people up to a late period. From the 5th c., however, it rapidly died out, chiefly in consequence of the Vandals, Goths, Moors, and other foreign tribes conquering the country, and importing their own idiom upon it.

As a branch of the so-called Semitic family of the Hebrews, Syrians, Arabs, &c., the Phenicians naturally are closely related to those also with respect to language. The affinity of the 'speech of Canaan,' as the Hebrew is called sometimes, with the Phenician was indeed remarked at an early period. Augustine, Jerome, and Frezing pointed out already—and sometimes in order to back some very peculiar notions—how closely these two languages and their dialects were allied. Yet it must be obvious at first sight, that however near the two ideas may originally have stood to each other, the peculiar relations and fortunes of the two races who spoke them must have produced substantial changes in their structure in the course of time. While the ancient scriptural monuments of the Hebrews—outwardly and inwardly—exhibit a rare unity of idiom and form, the ancient halloved utterance becoming a type and model for the later generations; the Phenicians, on the other hand, not confined within the narrow limits of their home-country, but mixing freely with all the nations of the earth, spreading their own colonies far and near among them, opened a wide field for the 'development' of their language, or rather for its corruption, by its entering into alliance with Idysian in Africa, Sardianic and Spanic, and with Aramaic in Northern Phoenicia, Cilicia, and perhaps even in Cyprus. Thus it came to pass that the two languages which originally may have been blended in old Canaan became more and more widely divergent. To enter into more detailed discussion on this or other cognate points, we deem more hazardous now than we should have thought it ten or even five years ago, for the more ample our discoveries in Phenician literature have become of late, the more it becomes evident that we are only at the commencement, as it were, of Phenician philology.

What we said of the structure of the Hebrew Language (q. v.), also holds good for Phenician to a certain extent; and we shall therefore simply point out the most palpable differences between them. In the first instance, we observe the very strange circumstance, that what is considered an archaism or an isolated dialect in Hebrew, appears as a common expression in Phenician. Certain grammatical terminations, obsolete in Hebrew, are in use in Phenician—so that it would appear as if the Phenicians had retained more of the ancient Canaanite speech

than the Hebrew, which gradually transformed and refined it by grammatical niceties. Another feature is the preponderance of the Chaldee, or rather Aramaic words and forms—although here again we are on very dubious ground. It might further be questioned whether our Phœnician Inscriptions—all belonging to a very late period—are not rather a faithful reflection of the Hebrew of their period, which, since the 8th c. B.C., had more and more changed into Aramaic. So much is certain, that the original language of Canaan was perfectly free from Chaldaisms, and that these are but a late corruption—such as we also find in the later books of the Old Testament. Yet there are other features quite peculiar to the Phœnician, which—although not of sufficient importance to warrant our separating the dialect entirely from the Hebrew—are of a nature not to be explained by any Semitic analogy; such as certain differences in the pronunciation of vowels, in the treatment of consonants, the formation of pronouns, some verbal forms, and certain words entirely foreign to the Semitic. Again, a distinction is to be made between the Phœnician of P. and that corrupted form of it spoken in the western colonies, called Punic, and further, that idiom peculiar to the inhabitants of Leptis, called Libyo-Phœnician—a mixture of Phœnician and Libyan, with a vast preponderance, however, of the former element.

The difference in the pronunciation may be briefly characterised as a tendency towards an obscuring or lowering, as it were, of the vowels: thus, the Hebrew *a* is changed into *o*, the *e* into *i* or *y*, *i* into *y*, sometimes into *u*, and *o* into *u*. Peculiar is also the use of the Hebrew *Ayin* as a vowel (*mater lectionis*), with the pronunciation of *o* or *u*. On some occasions, however, it is entirely omitted. The gutturals are changed at times, as in the corrupted orthography of Samaritan and Sabian, so that *L* and *R* are sometimes assimilated with the next consonant in the middle of the word, or entirely omitted, &c. As to grammar, our knowledge is extremely limited. A few undoubted facts are the termination of the nominative form in *at* instead of the Hebrew *ah*, the greater variety of genitive forms in Phœnician, the difference in the formation of the pronoun, and the identity of the article with that in Hebrew (*ha*). For the Phœnician alphabet, the model of all European alphabets, see ALPHABET.

The Literature of P., in its original form, has, as we said, perished entirely. What traces and fragments we have of it, have survived in Greek translations. But from even these small remnants, we can easily imagine the extreme antiquity, and the high importance and vast extent of these productions, which, at first, seem to have been chiefly of a theological or theogonical nature. Their authors are the gods themselves, and the writings are only accessible to the priests, and to those initiated in the mysteries. From the allegorical explanations of these exalted personages sprang a new branch of sacred literature, of which those fragments of Cosmogony mentioned above are derived. To the literary age of Taaut, Kadmus, Ophion, Esmun, &c., succeeded Thabion, Isiris, Sanchuniatho, and Mochus, who founded the schools of Priests and Prophets. These cultivated the sciences, chiefly the occult ones, magic, and the like. Nearest to the Sacred Literature stands Didactic Poetry, somewhat related to the Orphic, whose chief representatives are Sido, Jopas, &c. The erotic poetry is characterised as of a very sensuous nature, both in P. and the colonies. Of historians are mentioned Mochus, Hypsikrates (Sanchuniatho?), Theodotus, Philostratus, Menander, and others; but these are mere Greek versions of

their Phœnician names, and absolutely nothing has been preserved of their writings. Punic literature is also frequently mentioned by Greek and Roman writers. Geography, history, agriculture, were the fields chiefly cultivated by the colonists of Carthage and the West generally.

The monuments that have come down to us, and which not only have enabled us to judge for ourselves of the religion, the language, and the manners of the Phœnicians, are of twofold kind—they are either legends on coins and lapidary inscriptions, or Phœnician proper nouns and texts imbedded in the works of ancient classical or sacred writers. The principal and ever-growing source for our information, however, are the monumental inscriptions, of whose existence, till the middle of the 18th c., nothing was known. The most numerous Phœnician remnants have been discovered in the colonies. Richard Pococke first found, on the site of ancient Citium (Larnaka of to-day), 31 (not 33, as generally stated) Phœnician inscriptions, which he deposited at Oxford (published by Swinton, 1750). Malta, Sardinia, Carthage, Algiers, Tripolis, Athens, Marseille, have each yielded a considerable number, so that altogether we are now in the possession of about 120 monuments, either votive tablets, or tomb inscriptions. The latest and most remarkable are those now in the British Museum, discovered at Carthage a few years ago by N. Davis, consisting of votive tablets, a (doubtful) tombstone, and a sacrificial tariff, which completes another stone found some years ago at Marseille of the same nature; both setting forth the amount of taxes, or rather the proportionate share the priest was entitled to receive for each sacrifice. Another exceedingly valuable (trilingual) inscription, referring to the gift of an altar vowed to Eshmun-Asklepios, has been discovered a year or two ago in Sardinia. See below. One of the most important historical monuments is the sarcophagus of Ashmanasar II., king of Sidon (son of Tennes?), found at Tyre in 1855, the age of which has variously been conjectured between the 11th c. B.C. (Ewald)—a most incongruous guess indeed—the 7th (Hitzig), the 6th (Duc de Luynes), and the 4th (Levy), of which we shall add the commencement, literally translated: 'In the month of Bul, in the fourteenth year that I reigned, King Ashmanasar, king of the Sidonians, son of King Tebniith, king of the Sidonians—spake King Ashmanasar, king of the Sidonians, saying: Carried away before my time, in the flood of days—in dumbness ceases the son of gods. Dead do I lie in this tomb, in the grave, on the place which I have built. I myself ordain that all the nobles and all the people shall not open this place of rest; they shall not seek for treasures and not carry away the sarcophagus of my resting-place, and not disturb me by mounting the couch of my slumbers. If people should speak to thee [and persuade thee to the contrary], do not listen to them. For all the nobles and all the people who shall open this sarcophagus of the place of rest, or carry away the sarcophagus of my couch, or disturb me upon this resting-place, may they find no rest with the departed; may they not be buried in a tomb, and may no son and successor live after them in their place;' &c.

The votive tablets bear the same character throughout, differing only with respect to the name of the man or woman who placed it in a certain sanctuary in accordance with his or her vow. Their material is mostly limestone or fine sandstone, rarely marble, and they vary from 5 to 15 inches in height, from 4 to 7 in width, and from 1½ to 4 in thickness. Beginning in most cases with the dedication to the god or goddess, or both, thus: '[Sacred] To the god . . . [this tablet]

Carthaginian votive tablets with which the British Museum (now the wealthiest in Phœnician monuments) has lately been enriched, as mentioned before.

The emblems on it are symbolical, and refer to the deities invoked. The lower part is mutilated, but easily supplied. The date is uncertain, perhaps the 2d or 3d c. b. c.

The second is a trilingual inscription from a base of an altar, recently found at Pauli Gerrei, in Sardinia, and has been first fully explained by Deutsch. (See *Transactions of the Royal Society of Literature*, 1864.)

Its contents are briefly this: A certain Cleon, Phœnician by religion, Greek by name, Roman by nationality, a salt-farmer, vows an altar—material and weight of which are only given in Phœnician; viz., copper, a hundred pounds in weight—to Eshmun-Esculapius 'the Healer' (the Phœnician *Mearrach*, clumsily transcribed *Merre* in Latin, and *Mirre* in Greek), in consideration for a cure to be performed. The date, given in Phœnician, viz., the year of two, apparently annual, entirely unknown judges, gives no clue to the time. Palæographical reasons, however, would place it in about the 1st c. b. c.

Among those who have more or less successfully occupied themselves with Phœnician antiquities, language, and literature, and who have also, in some instances, deciphered inscriptions, we mention Scaliger, Bochart, Pococke, Barthélemy, Swinton, Bayer, Dutens, Hamaker, Gesenius, Movers, Munck, Judas, Bargès, De Saulcy, Ewald, Levy, Vaux, Renan, De Luynes, De Vogüé, Deutsch, and others; to whose writings, contained either in special works or scattered in *Transactions of learned societies*, we refer for further information on the subject of our article. The principal work in German is Movers's *Phœnizier*, unfortunately left unfinished at the author's death. A useful English compilation is Kenrick's *Phœnicia* (Lond. 1855).

PHENICOPTERUS. See FLAMINGO.

PHœ'NIX, the name of a mythical Egyptian bird, supposed by some to be a kind of plover, like the *kibitz*, often depicted with human arms, and called in hieroglyphs *rehk*. Others consider it to be the *bennu*, or nycticorax, a bird sacred to Osiris, and represented watching in the tamarisk over his coffin. The first of these representations has sometimes a star upon the head, supposed to indicate the astronomical period of its appearance. It visited Egypt after the death of its father, and entered the shrine particularly dedicated to it at Heliopolis, and there buried its parent, putting the body into an egg or case made of myrrh, and then closing up the egg. Another account is, that the P., when about to die, made a nest for itself in Arabia, from which a new P. sprung of itself. This bird proceeded to Heliopolis, and there burned and buried its father. But the more popularly-known version is, that the P. burned itself, and a new and young P. sprung from the ashes. A less received version is, that a worm crawled out of the body of the dead P., and became the future one. The P. was, according to the most authentic accounts, supposed to visit Egypt every 500 years; the precise period, however, was not known at Heliopolis, and was a subject of contention till its appearance. The connection of the Phoenix period with that of the Sothiac cycle, appears to be generally received by chronologists, as well as the statement of Herperpolo, that it designated the soul and the inundation of the Nile. A great difference of opinion has prevailed about the Phoenix period: according to Ælian, it was a cycle of 500 years; Tacitus seems to make it one of 250 years; Lepsius, a cycle of 1500 years. The P. was fabled to have four times appeared in Egypt: 1, under Sesostrius; 2, under Amasis, 569—525 b. c.; 3, under Ptolemy

Philadelphus, 284—246 b. c.; and lastly, 34 or 36 A. D., just prior to the death of Tiberius. The P. also appears upon the coins of Constantine, 334 A. D., viz., 300 years after the death of Christ, who was considered the P. by the monastic writers. It is supposed by the rabbins to be mentioned in Job and the Psalms.—Job xxxix. 18; Psalms ciii. 5; Herodotus, ii. 73; Achilles Tatius, iii. 25; Tacitus, A. D. vi. 28; Taelzes, *Chil.* v. 397; Lepsius, *Einleit.* p. 183; *Archæologia*, vol. xxx. p. 256.

PHœNIX. See DATE PALM and PALME.

PHO'LAS, a genus of lamellibranchiate molluscs of the family *Pholadidæ*. This family, to which the Ship-worm (*Teredo navalis*) also belongs, has the shell gaping at both ends, thin, white, very hard, sometimes with accessory valves; the two principal valves beset with calcareous inequalities, connected by fine transverse parallel ridges, forming a kind of rasp, used by the animal for boring a hole in rock, wood, or other substance, in which it lives. The animal itself is either club-shaped (as in *Pholas*) or

A piece of rock bored by Pholades.

worm-shaped (as in *Teredo*), with large long siphons often united almost to the end, and a short foot. Several species are natives of the British coasts. They are popularly called *Piddocks*. They are used for bait, and also for food. How the pholades or piddocks excavate the holes in which they live, sometimes in clay or mud, but often in chalk, and even in much harder rocks, has been the subject of much dispute. An excavating instrument armed with silicious particles, has been ascribed to the animal, but no such instrument exists. The shell is studded with projections, in regular rows, giving it the character of a rasp or file; and the P., fixing itself firmly by its foot, which acts as a sucker, and working itself, from side to side, makes use of the rasping power of its shell to enlarge its hole as it has need, so that the hole is always very exactly accommodated to the size of the occupant.

PHONETIC WRITING is the representation of speech by means of symbols for the elementary sounds of language. All alphabetic writing is essentially phonetic. The invention of letters was the invention of phonetic writing, as distinguished from the older pictorial, or ideographic, writing. From a variety of causes, however, no language has ever been perfectly represented by its spelling, and with the lapse of time the divergence has gone

in language, since the spoken words are constantly undergoing change, while the spelling tends to remain fixed. In English, more especially, this document has been almost as pressed to such an extent that it is admitted on all hands to be a clumsy relic, and in recent times various schemes have been projected to remedy it. It is to these schemes or partially reformed spelling that the name of Phonetic Writing is now more especially applied; and what follows represents the views and arguments of the promoters of the movement, and answers its history.

The earliest attempts at alphabetic writing were naturally phonetic as the limited scheme of symbols suited or as the limited aim of writers required. The alphabets were confined almost exclusively to consonants; and the analysis of speech on which they were based was of course confined to the consonants for which the alphabets were designed. When any did alphabetic, therefore, none to be required for a new language or dialect, it would be inconsistent with the intent of writing any sounds not used and used in the language for which the alphabet was originally intended. Unless, then, new symbols were added for the new sounds, these latter must have been represented by conventional combinations of letters; and at this point the writing would cease to be perfectly phonetic.

The Sanskrit language furnishes the most notable proof of the original phonetic character of alphabetic writing, for not only were words written exactly as they were sounded, but every change which a word underwent in utterance was accurately indicated by a change in the writing. Nevertheless this fact, there is no language in which this etymological and grammatical relation of words has more clearly exhibited or more fully traced than in Sanskrit. One word language illustrates the same principle. No difficulty is experienced in constructing the relation between *hair* and *hairs*, *lay* and *laid*, notwithstanding the change of *r* into *i* in the plural; nor would any difficulty be caused through the plural being changed, as it is in *seed* and the words written as they are pronounced—*seeds*, *wives*.

The English language furnishes in its dialects almost all the elementary sounds of all languages; and the Latin alphabet, which was adopted for its writing, was so insufficient in the number of its characters that many new letters have been devised to adapt it for the representation of Anglo-Saxon and other words. But in place of being extended, the alphabet was reverentially accepted with all its imperfections; its deficiencies were supplemented by the use of *seville* or silent letters, and by various orthographical expedients; and thus the writing came to be irregular, difficult, and misleading. The great inconvenience, however, of representing by the same character the sounds of *U* and *V*, led to the introduction of the former as a new letter for the vowel sound, and to the limitation of the latter character to the consonant sound; and the further ambiguity arising from the want of an appropriate sign for the sound of *W*, led to the occasion of that symbol, which, being formed by joining together two of the old *V* characters, was thence called 'double *V*'—pronounced, according to the sound of *V*, 'double U.' The phonetic principle was fully recognized in these changes, and they furnish precedent for further changes, from a necessity for them shall be sufficiently left and acknowledged.

There can be no doubt that phonetic writing would greatly facilitate the acquisition of the power of reading, and consequently of the education of children and illiterate adults; as well as tend to

the reduction of dialects to one common standard, and further the diffusion of our language in foreign countries. To learn to read from perfectly phonetic characters, would be merely to learn the alphabet, and to spell would be merely to acquire pronunciation. A child at school might in weeks or months learn to read. All uncertainty of pronunciation would vanish at the start of a word, and differences of pronunciation would be superfluous.

If all the languages which employ the Latin alphabet, the English is the worst represented; in some measure because of the rich variety of its classic elements, but chiefly because, of all the nations which have adopted Latin letters, the English have done least to make their writing phonetic. Every attempt to correct the anomalies of our orthography has raised a host of prejudices, against which the efforts of private individuals have been powerless. The difference between phoneticians and their opponents seems to be a fundamental difference as to what really constitutes a word. The former, maintaining the word to be the true word, would demand all associations dependent on letters, in order to represent the exact sound in the simplest manner; the latter, clinging to the literal associations of orthography, argue as if the verbal cluster of letters in reality constituted the word. The dispute is thus, in effect, between letters and sounds; which are the signs—which the thing signified?

In phonetic writing, the eye would no longer ascertain such words as *base* and *an*, *an* and *sea*, *like* and *sea*, when written separately, as in a vocabulary; but it cannot be supposed that such words would present more ambiguity in contextual usage than they now do in utterance, subject to the same confusion to the ear. At present, we have, in fact, two languages—one purely phonetic, addressed to the ear; and the other, in some degree stylized or historical, addressed to the eye. In this respect, we are in a similar position to the Chinese, with their classical descriptive language of literature, and their multitudinous vernacular dialects. In order to establish the assertion, that the phonetic word (the sound) written phonetically in a sentence would be less intelligible to the eye than the written word in its present form, it is incumbent on the opponents of phoneticism to show that the simple phonetic word is now less intelligible when pronounced in a sentence, than its written symbol is when read in a sentence.

The principal objection urged against phonetic writing is, that it would obscure the etymological history now discoverable in the orthography of a word. The best answer to this objection is that the traces of etymology, preserved in the present spelling, are so imperfect and inconsistent as to be of little value compared with the embarrassments they occasion in other respects.

The first requisite for the construction of a phonetic alphabet is an exact knowledge of elementary sounds, that every element may be provided with its appropriate symbol, and that no more symbols may be introduced than there are distinct elementary sounds. The latter consideration would be of importance only in connection with a general alphabet available for all languages. An alphabet for any individual language might contain symbols for compound sounds, with no other disadvantage than that of adding to the number of symbols. It would not, for instance, be of any consequence, so far as phonetic writing is concerned, whether the word *acids* were represented by the letters *acids*, *acx*, or *acv*, so that the symbols used were invariably appropriated to the same sounds. Orthopetists and phoneticians are not agreed as to what elements compose many of

our compound sounds, such as those heard in the words *chair, queen, tune, I, out, &c.* Any attempt, therefore, at representing compounds analytically would be premature, until the analysis of the compounds had been settled. This analysis would be absolutely necessary for a general alphabet, but not so for an alphabet for any single language. Phonetic writing, then, should be separately considered, as a means of representing the elementary sounds of all languages, and as a method of symbolising the pronunciation of any one language only. We shall now shew the nature of the attempts that have been made for the phonetic writing of English.

Dr Franklin, in 1768, proposed a phonetic alphabet for English, in which new symbols were introduced for the vowels heard in the words *on* and *up*, and the four consonants heard in the words *she, they, and thing*. Many other schemes have been from time to time proposed; but the only alphabets which have been practically applied on a large scale are those of Dr Comstock in America, and Messrs Ellis and Pitman in England. The object of experimenters in this department has generally been to make use of existing letters as far as possible, and only to supplement deficiencies by new forms. The common alphabet has been made to furnish almost a sufficient number of characters by the inversion of some of its letters—thus, *A, Δ, ε, o, e, Z, q, &c.*, as in the 'Anti-absurd' alphabet of Major Beniowski; but the best scheme of phonotypes that has yet been introduced was the joint production of Mr Isaac Pitman, the inventor of the first system of phonetic shorthand writing, and Mr A. J. Ellis, B.A. of Cambridge, a most accomplished mathematician and linguist. This alphabet was completed in 1847; and the experiment of its introduction was carried out with great diligence and perseverance by its promoters, until an army of philanthropic assistants became enlisted in all parts of Great Britain and America. Primers and school-books were issued, and tested on juvenile and adult classes; many works of standard literature, and even the entire Bible, were translated into the new spelling; magazines were published, and ultimately a newspaper, printed in the phonetic character, was started by the enterprising orthographic reformers. In this scheme of phonotypes, diphthongal and articulate compounds were not analysed, and the letters of the ordinary alphabet were retained in their most common signification, seventeen new characters being introduced for unrepresented or ambiguously written sounds. The forms of these were, in most cases, happily suggestive of the displaced orthography, and the general aspect of the writing bore such a resemblance to common typography, that any good reader of the latter could decipher the new printing with ease, after a very brief study of the alphabet. The ordinary vowel letters (*A, E, I, O, U*) were pronounced as in the words *am, ell, ill, on, up*; the consonants *C* and *G* were sounded as in *came* and *game*; the letters *K, Q, X* were rejected as superfluous, and all the other letters of the common alphabet were retained, with their established sounds. Comparing this scheme of letters with the tabulated elementary sounds of English, we find that it represents all the vowels, except the nice varieties heard in the words *air, ore, err, ask*; and that all the consonants are accurately represented except *wh*. The latter element is written by letters sounding *hoo*, so that the words *where* and *who'er* are made identical to the eye; and the sentence, 'I saw the man *whet* the knife,' is written, 'I saw the man *who ate* the knife.'

Notwithstanding these imperfections, this alphabet was found to work well among those who were disposed for a reform. The phonetic method was

proved to be remarkably simple and easy in comparison with the ordinary system; the time occupied in making fluent readers was greatly reduced; and readers of phonetic printing experienced but little difficulty in the transition to reading from common orthography.

The advantages claimed for the system were chiefly: rapidity of learning to read, certainty of pronunciation, and increased facility in common reading, after the power of phonetic reading had been acquired. The chief disadvantages alleged against the system were: accustoming the eye to a false orthography, and teaching what had to be in great part unlearned after it was acquired. Whether the objectors were right or wrong, they were overpoweringly numerous, and the system failed to do more than prove that phonetic spelling greatly simplifies the acquisition of the power of reading.

The original phonotypic alphabet, described above, has been for some years discarded in the printing, issued from the 'Phonetic Institution' (Bath), and a more analytic alphabet has been adopted, in which *eleven*, instead of *seventeen*, new forms are introduced. The latest edition of this alphabet gives the ordinary vowel letters *A, E, I, O* for the sounds in the words *am, ell, ill, on*, and the letter *U* for the sound in *pull*; *K* is restored, and *C* rejected; *J* is used as in French; and the elementary sound of *wh* is still unacknowledged. The eleven new characters represent the consonants in the words *she, oath, they, and (s)ing*; and the vowels in the words *ale, ell, alma, old, all, pool, up*.

The following are the forms of the new letters as printed and written, with a passage exhibiting their appearance in composition.

This Phonetic Alphabet consists of 34 letters, viz. the 23 useful letters of the common alphabet (*c, g, and x* being rejected), and the 11 new ones below. *J* is used for the French *j* (*zh*), or *g* in 'edge' or *s* in 'vision'; hence *dj* represents *J* in *John*, and *dj* in *edge*. *Tg* (*t sh*) represents *ch* in *chase*, and *sch* in *catch*. *Y* and *w* are consonants; *wh* being replaced by *hw*. The vowels *a, e, i, o, u* have invariably the short sounds heard in *pat, pet, pot, put*. All the other old letters have their usual signification. The italic letters in the words in the third line denote the sounds of the letters.

VOWELS.

A a E e I i O o U u — *W w* — *Y y*
Alma, age, air, eat — *all, ope, food* — *sun, hat*
ams, edj, er, it — *ol, op, fund* — *sun, but*

DIPHTHONGS.

ai, ei, oi, ou || *E g, E d, E d, U g*
ai, ei, oi, ou || *sh, thin, then, sing*
ay, by, boy, now || *ci, bin, den, sip*
ai, bei, boi, nou ||

CONSONANTS.

The double letter *u*, as in *unit, unite, duty, va/ue*, is written thus: "yunit, yuneit, diuti, valiu." When *ai, oi*, make a *dissyllabic* diphthong, the second letter is marked with a diacritical; thus, *so/afy, soig*.

"Tiz de meind dat maks de bodi ritg;
 and az de sun breks tru de darkest klouds,
 so onor 'pire in de minest habit.
 † Hwt! † iz de dje mer preqs dan de lara,
 bikoz his federz ar mer biutiful;
 or † iz de ader beter dan de il,
 bikoz his pentid skin kontents de el.
 † ne, gud Ket; neider art dou de were
 for dis pur fsmritur and min ara."

The reduction in the number of letters from that of the Etruscan and Pictish alphabets is attained chiefly at the expense of the phonetic principle in the attempt to analyse dipthongs in writing. Before their current phonetic analysis has been ascertained and settled. Thus the compound sound in the word *see* before represented by a single character is now analysed into the elementary vowels heard in the words *ee* and *ee*; the diphthong in the word *see* is analysed into the elementary sounds in *ee* and *ee*; and the diphthong in the word *see* is analysed into the elementary sound in *ee* and *ee*.

The original phonetic alphabet was of proved value as an auxiliary alphabet, from which the transition to reading from ordinary orthography was easy, and on this ground it had many advantages; the recent modifications, which are doubtful improvements, have been introduced apparently with the view rather of superseding established orthography, and on this ground, it is to be feared, the 'reformed' phonetic alphabet will meet with comparatively few supporters.

But the full advantages of the phonetic principle are not secured to the learner while phonetic writing is used only as introductory to common reading. Phonetic spelling would require to be authoritatively established, so as to be irreproachably in ordinary use, otherwise the learner has still to master the more difficult orthography after the phonetic mode has been learned. At present, spelling is the task of a good vernacular education, and the applicability of this last phonetic writing mode is destroyed.

But may not the advantages of phoneticism, so far as simplifying the acquisition of reading is concerned, be obtained by the phonetic teaching of ordinary letters, and without any alphabetic change? Such a result is undoubtedly practicable, as by Mr Bell's method (in his *new book of letters and sounds*) of showing the orthography of a word and its sound together, and teaching the latter only while the learner's eye is accustomed to the former one. Thus, the words *leaf, debt, wife, wreath, wreath, etc.* are pointed *leaf, debt, wife, wreath, wreath, etc.* The associations of orthography are clearly fixed by the eye, and this plan for learners preserves the pictorial aspect of words, and shows to once the phonetic spelling and the established orthography.

But the question recurs: Why should established orthography be superseded? Or, at least, why should not some national measures be adopted to arrest the accumulation of our spelling? A similar work was undertaken by the Spanish Academy in the middle of last century, and carried out as efficiently that, at the present day, the pronunciation of any word in Spanish is immediately determined with certainty by every reader who merely knows the phonetic value of the alphabetic characters. The writing of the Italian, Dutch, and many other languages has also been successfully phoneticized. A similar result would be attained in English, if the work of orthographic revision were subjected to a competent tribunal, and if such changes as might be found necessary were duly sanctioned by authority. New letters should be added to the alphabet for the six unrepresented simple consonant sounds, *Sh, Zh, Th, Dh, Wh, Ng*; or, at all events, the writing of these elements should be made distinctive; and, with a few rules for distinguishing the vowel sounds, little alteration of spelling would be needed to approximate the writing of English to phonetic accuracy.

A general phonetic alphabet, available for the writing of all the sounds of human speech, is still a scientific desideratum. Such an alphabet would be

of great practical value to travellers, colonists, missionaries, and philologists. Much attention has been paid to this subject of late years. In 1854, a conference of philologists was held in London, at which two rival alphabets were produced, one by Professor Lepsius of Berlin, and another by Professor Max Müller of Oxford. The former has been adopted by the Church Missionary Society, but so many local diversities in the value of the characters have been found necessary in different countries, that this 'Universal Alphabet' has been practically split up into several alphabets. The writing is, besides, overlaid with descriptive points. In the alphabet of Professor Max Müller, the latter difficulty is obviated by a free use of compound letters. The *Lectures on the Science of Language* by this author may be consulted with great advantage, both as to the phonology of speech and the history of words. In the second series of these Lectures, diagrams of the organic formation of many of the elements of speech are given, as well as a comparative table of four alphabets that have been used in the transcription of Sanskrit, and numerous references to the works of continental and other writers who have treated of the science of phonetics.

The most elaborate scheme of a universal alphabet hitherto published is that of Mr A. J. Ellis. In this alphabet 44 sounds are discriminated by means of an ingenious system of compound letters, but the complexity of the writing forbids the possibility of its 'universal' adoption.

The chief difficulty in the construction of a universal alphabet has arisen from the want of a complete classification of elementary sounds; another difficulty has been created by an adherence to the inadequate letters of the Roman alphabet. The resolutions of the alphabetic conference were decidedly in favour of Roman letters as the basis of the proposed 'standard' alphabet. But the wisdom of this decision may be questioned. No existing alphabet exhibits the natural relations of the sounds it represents; and, consequently, although an alphabet physiologically complete were framed, it could not incorporate Roman, Greek, or any other letters at present in use, without sacrificing the most essential qualities of a universal alphabet—simplicity and congruity. Symbols must be devised which would indicate to the eye all the organic relations discoverable by the ear between the various elements, and which would be free from the associations that would attach to adopted letters familiar to the eye with other meanings.

A general or panethnic alphabet must, of course, embody an exhaustive classification of sounds, and its characters should be designed to be *particularly* suggestive of the organic actions which produce the sounds, so as to be universally intelligible. In this way, a person who had never heard the language or the sound might pronounce it from the physiological writing, if he were only acquainted with the modes of action of the organs of speech, and the representative principle of the alphabet. By means of such a scheme of symbols, all the sounds of every language, including even the laugh, the sigh, the murmur, the groan, the moan, the liege, the hurr, and the imitative sounds practised by ventriloquists, as well as the modulative distinctions of the Chinese, the Hottentot Clicks, and the peculiar inspiratory sounds indulged in by savages, might be represented phonetically with the utmost directive precision, and by a wonderfully small number of radical characters. If ever the utopian dream of a universal language is to be realized, its alphabet must be phonetic, and its elementary symbols not selected from old alphabets, but new, designed from the mouth, pictorial or analogical,

and forming a 'visible speech.' See **VISIBLE SPEECH**. Phonetic writing on such a basis would not encounter the prejudices that have hitherto defeated the efforts of orthographic reformers; and it would be of considerable immediate service to linguists, besides being a beginning and a promise of the widest utility. For phonetic shorthand writing, see **SHORTHAND**.

PHONOMANIA. See **HOMICIDAL MANIA**.

PHOSGENE GAS, known also as **OXYCHLORIDE OF CARBON** or **CHLOROCARBONIC ACID**, is represented by the formula COCl_2 , or more correctly by its double $(\text{COCl})_2$. It is a colourless, suffocating gas, which is formed by exposing equal measures of carbonic oxide and chlorine to the direct action of the sun, when they combine and become condensed into half their volume. It does not possess any acid characters, but water decomposes it into carbonic and hydrochloric acids, as is shewn by the equation $(\text{COCl})_2 + 2\text{H}_2\text{O} = 2\text{CO}_2 + 2\text{HCl}$. This gas is of great interest in relation to the artificial production of Urea (q. v.) from inorganic matter.

PHOSPHATES (in Physiology). The following phosphates* play an active part in the chemistry of the animal body.

Phosphate of Soda, which may occur under any one of the three forms $3\text{NaO}, \text{PO}_5$, or $2\text{NaO}, \text{HO}, \text{PO}_5$, or $\text{NaO}, 2\text{HO}, \text{PO}_5$. All these salts are soluble in water; and the first two have an alkaline reaction, while the third is acid. By exposure of the second of these salts ($2\text{NaO}, \text{HO}, \text{PO}_5$) to a red heat, it is converted into what is termed *pyrophosphate of soda* ($2\text{NaO}, \text{PO}_5$), in which the phosphoric acid is obviously no longer tribasic, but bibasic; and by similarly treating the third of these salts ($\text{NaO}, 2\text{HO}, \text{PO}_5$), we convert it into the so-called *metaphosphate of soda* (NaO, PO_5), in which the phosphoric acid is monobasic. It is in consequence of these changes under the action of heat, that the terms *pyrophosphoric* and *metaphosphoric* have been used as synonyms for *bibasic* and *monobasic phosphoric acids*. Phosphate of soda, in one or other of the above forms, occurs as a constituent of all the animal fluids and soft tissues of the body, but is especially abundant in the urine and the bile. There are reasons for believing that it is the second and third of these salts which occur as constituents of the animal body, although the first may possibly sometimes be found. Pyrophosphate and metaphosphate of soda are often found in the ashes of animal fluids or tissues after the process of incineration, but they merely result from the action of heat on the two other salts. The following remarks on the derivation, elimination, and physiological importance of the phosphate of soda, are equally applicable to the corresponding salts of potash, which are always associated with them. The phosphates of the alkalies, which occur in the animal body, obviously owe their origin, either directly or indirectly, to the food; viz., directly, by being ingested as phosphates of the alkalies; or indirectly (within the system), by the action of phosphate of lime on salts of the alkalies. The elimination of these salts from the system is necessary, because they are being constantly supplied by the food; and this process is effected mainly by the kidneys and the intestinal canal. In the carnivorous animals, whose blood is much richer in phosphates than that of herbivora (the ash of the blood of the dog, for example, contains from 12 to 14 per cent. of phosphoric acid, while that of the ox or

sheep does not contain more than from 4 to 6), these salts are carried off by the urine; but in consequence of the formation of free acids as products of the disintegration of the tissues, a portion of the base is abstracted from the originally alkaline phosphates, and a corresponding portion of phosphoric acid is liberated. The originally alkaline salt is thus rendered neutral or even acid; and the occurrence of the acid phosphate of soda, $\text{NaO}, 2\text{HO}, \text{PO}_5$, in the urine is thus explained. In the herbivorous animals, on the other hand, the urine contains no phosphates, the whole of the phosphoric acid taken in their food being eliminated by the intestinal canal in the form of the insoluble phosphates of lime and magnesia. Although the general distribution of the phosphates of the alkalies in the nutrient fluids (there is 40 per cent. of them in the ash of the blood-cells; 28.4 per cent. of phosphoric acid and 23.5 of potash in the ash of cow's milk; and about 70 per cent. of phosphoric acid in the ash of the yolk of egg) is in itself an indication of their importance, the exact nature of their functions is not completely understood. Liebig has specially drawn attention to the peculiar grouping of the acid and alkaline fluids of the animal body. The permanence of this grouping is chiefly maintained, especially in herbivorous animals, by the conversion, within the body, of alkaline and neutral phosphates into acid phosphates by the means already described. Moreover, all tissue-forming substances (the protein bodies) are so closely connected with phosphates, that they remain associated during dissolution and subsequent re-precipitation of these substances; and the ash of developed tissues (such as muscle, lung, liver, &c.) always affords evidence that acid phosphates existed in the recent tissue; and, further, no exudation from the blood-vessels can undergo transformation into cells and fibres, or, in other words, become organised, unless, in addition to other conditions, phosphates are also present. Another very convincing proof of the share taken by the phosphates in the formation and functions of the tissue, is the fact, that although herbivorous animals take up a very small quantity of phosphates in their food, and although their blood is very poor in these salts, their tissues contain as large a proportion of phosphates as the corresponding parts of carnivora. Lastly, the fact, that one equivalent of the alkaline phosphate of soda ($2\text{NaO}, \text{HO}, \text{PO}_5$) possesses the property of absorbing as much carbonic acid as two equivalents of carbonate of soda, leads us to the belief, that the power of attracting carbonic acid, which the serum of the blood possesses, is due at least as much to the phosphate as to the carbonate of soda, and that, consequently, phosphate of soda plays an important part in the respiratory process.

Phosphate of Lime occurs in the organism in two forms, viz., as the neutral or basic phosphate, $3\text{CaO}, \text{PO}_5$, and the acid phosphate, $2\text{CaO}, \text{HO}, \text{PO}_5$. The neutral phosphate occurs in all the solids and fluids of the body, but is most abundant in the bones, in which it amounts to about 57 per cent.; and in the enamel of the teeth, in which it ranges from 80 to 90 per cent. It may at first sight appear inexplicable how a salt so perfectly insoluble in water as neutral phosphate of lime, can be held in solution in the animal fluids. In some fluids, as the blood, it is probably, in part at least, combined with albumen, with which it forms a soluble compound; while in other fluids, as the urine, it is held in solution by a free acid or by certain salts (as, for example, chloride of sodium), whose watery solutions are more or less able to dissolve it. If any proof is wanted of the functions of this salt in relation to the bones, it is afforded by the well-known experiment

* The means of distinguishing between the salts of tribasic, bibasic, and monobasic phosphoric acid, are given in the article **PHOSPHORUS**.

of Tissot, who showed that when two small quantities of it is taken with the food, the bones lose more or less of their hardness and become, and eventually do so, readily united. Phosphate of lime, like the phosphates of the alkalis, is indispensable to calcification, and so a great illustration of this fact, it may be mentioned that in the teeth of the molluscs (where new cells for the formation of shell abound) this salt is far more abundant than in any other part of the body. Although by far the greater quantity of the phosphate of lime found in the body has doubtless precipitated in the food, yet it is unquestionable, that a part of it is formed within the organism by the action of carbonic or lactic on the phosphoric acid that is formed during the decomposition of the phosphorus-containing tissues, such as the brain, for example. In man and mammiferous animals, a certain portion of the phosphate of lime is eliminated by the kidneys, and the rest is carried off in the excrements; while in herbivorous animals the whole is carried off in the excrements. The most phosphate of lime is occasionally found in the urine of man and mammiferous animals, but it is of no practical importance. For a notice of the amount of early phosphate daily eliminated by the kidneys, the reader is referred to the article *Urina*.

Basic Phosphate of Magnesia, $2MgO.PO_4$, is rare, as, both in its chemical and physiological relations, it corresponds to salts of lime, with which it is always associated. The abundance of this salt in the seeds of the cereals, and in the other ordinary kinds of vegetable diet, sufficiently explains its presence in the system. A far less amount of this salt than of the corresponding lime salt, seems to be required by the organism, as is shown by the relative quantities in which they occur in bone (of the former to 1/3 of the latter), and as is further indicated by the fact, that, relatively, far more of this than of the lime salt escapes intestinal absorption, and appears in the excrements.

The only phosphates remaining to be noticed are the phosphate of ammonia and magnesia, or, as it is sometimes termed, the triple phosphate, $3MgO.NH_4O.PO_4 = 246$, which occurs in beautiful prismatic crystals in alkaline urine, and, indeed, in very specious of urine that is beginning to putrefy, but the phosphate of soda and ammonia, which is occasionally found as a crystalline sediment in putrid urine.

PHOSPHATIC DIATHESIS, in Medicine, designates the condition in which there is a tendency in the urine to deposit white gravel. As the deposit of urates (see *URATE ACID DIATHESIS*) depends upon an excessive acidity of the urine, so that of the phosphates is determined by the opposite condition—namely, by deficient acidity, or by positive alkalinity. Alkalinity of the urine may occur from two distinct causes—viz. (1) from the presence of the carbonate of a fixed alkali (potash, or soda), or of alkaline phosphates of soda (see *PHOSPHATES* in Physiology); or (2) from the presence of the carbonate of the volatile alkali, ammonia, which is due to the decomposition of urea. This decomposition is due to the fermenting action of the leuca of the bladder on the urea, and is explained

by the equation— $CO(NH_2)_2 + 2H_2O = 2NH_3 + CO_2$.

The white gravel which is deposited in the second of these conditions—viz., when the urine contains carbonate of ammonia, is composed of minute elongated prismatic crystals of the triple phosphate of ammonia and magnesia, whose formula is given in the article *PHOSPHATES*. This salt is formed as follows: Healthy urine contains phosphate

of ammonia in a state of solution. If, however, the urine becomes alkaline from the decomposition of the urea, a portion of the ammonia combines with the phosphate of ammonia, and forms the triple salt which is insoluble in the urine, which has now become alkaline. With this triple phosphate, there is almost always an admixture of phosphate of lime (PO_4) in the form of an amorphous precipitate. The tendency to deposit the mixed phosphates (triple phosphate and amorphous phosphate of lime) is especially observed in cases of disease or injury of the spinal cord, and in disease of the bladder, particularly in chronic inflammation of its mucous coat. Upon allowing urine of this kind, which is usually pale in colour, to stand for some time, an increased film or pellicle gradually forms upon its surface, which, when examined under the microscope, is found to consist mainly of the salts we have described. Such urine speedily becomes putrid, and acquires a strong ammoniacal odour.

The above is by far the most common form of the phosphatic deposits, but, as has been already stated, the urine may become alkaline from the presence of the carbonate of potash or soda; and then, no ammonia being present, in place of the triple salt, there is a deposition of amorphous phosphate of lime, or in rare cases, of a crystalline similar phosphate, whose composition, according to Dr. James Jones, is represented by $2CaO.HO.PO_4$ (*Ann. of Chem. Soc.* vol. 15). In these cases, the urine is alkaline, pale, viscid, slightly turbid, of low specific gravity, and of a peculiar odour. This urine makes reddened litmus paper permanently blue; while ammoniacal urine causes only a temporary change in the colour of the same test-paper. As the urine cools, and sometimes even in the bladder, the white sand is deposited, occasionally giving the last portion of the excreted urine a milky appearance. During perfect health, the urine often becomes temporarily alkaline during the act of digestion (when the gastric juice is especially acid); but as a general rule, the tendency to alkalinity from a fixed alkali, and therefore to phosphatic deposits, is associated with general debility. These deposits occur for the most part in scallow, languid, unhealthy-looking persons, whose vital energies have been depressed by mental anxiety, by insufficient food, or by sexual excesses.

In both forms of alkaline urine, and therefore of phosphatic deposits, a generous diet and tonics, such as bark, wine, and the mineral acids (given before meals), are of great service; and opium is usually of great value, if judiciously administered. Small doses of benzoic acid, twice or thrice a day, with the view of restoring the acidity to the urine, and the occasional washing-out of the bladder with tepid injections, have been also found serviceable in the ammoniacal form of the disease.

PHOSPHORESCENCE. Strictly speaking, the term is applied to the phenomenon, exhibited by certain bodies, of remaining luminous in the dark for some time after being exposed to a strong light. In this sense, it is strictly analogous to, perhaps we should say, identical with, the heating of bodies by exposure to light or radiant heat. They absorb part of the energy of the vibrations which fall on them; it becomes motion of their particles; and is again radiated from them as light or heat. Certain preparations, such as Canton's Phosphors (q. v.), indurated limestone, &c., possess this true phosphorescence in a very high degree. With the great majority of phosphorescent bodies, however, the duration of the phenomenon is very short, rarely more than a small fraction of a second. Becquerel, who has recently studied this phenomenon with great care, has invented a very ingenious instrument

PHOSPHORESCENCE—PHOSPHORUS.

for the purpose, called a *phosphoroscope*. The body to be tried is placed in a small drum, which has an opening at each end. In this drum there revolve two discs, mounted on the same axle, and pierced symmetrically with the same number of holes. They are so adjusted, that when a hole in one disc is opposite to the hole in the corresponding end of the drum, the second disc closes the hole at its end of the drum, and *vice versa*. Light is admitted by one of the holes in the drum, so as to fall on the object, and it is examined through the other hole. It is obvious that when the discs are made to revolve, the object is alternately exposed to light, and presented to the eye. By a train of multiplying wheels, these alternations may be made to succeed each other as rapidly as the observer pleases, and thus the object is presented in the dark to his eye as soon after its exposure to light as may be desired. Almost all bodies are found to be phosphorescent; for instance, some kinds of pink rubies, when exposed to sunshine in this apparatus, appear to glow like live coals in the dark. The phenomenon is, in fact, precisely that which was observed by Brewster and Herschel in quinine and certain crystals of fluor-spar, and thence called *Fluorescence*. Stokes was the first to give the true explanation of these facts, and he shewed it to depend upon the change of refrangibility (i. e., colour) which light suffers on being absorbed and then radiated by the fluorescent substance. The green colouring-matter of leaves, a decoction of the bark of the horse-chestnut, and the common *canary glass* (coloured with oxide of uranium), are bodies which exhibit this phenomenon very well. Perhaps the most striking method of studying the phenomenon is to receive in a darkened room the solar Spectrum (q. v.) on a sheet of white paper; and to pass over the coloured spaces a brush dipped in a solution of sulphate of quinine with sulphuric acid. No change is produced on the less refrangible rays, but in the blue and indigo spaces, a strange change of colour is at once apparent where the liquid has been spread. This appears more strongly in the violet, and vividly in the spaces beyond the violet, where rays fall which excite no luminous sensation in the eye. By this experiment, the visible length of the spectrum may easily be doubled. By using the electric light, which is peculiarly rich in these highly refrangible rays, a prism of quartz, which allows them to pass very freely, and various fluorescent substances, Stokes has obtained spectra six or eight times as long as those otherwise visible. The characteristic of all these rays is, that they are *less* refrangible than those from which they are produced. The entire phenomenon is identical in principle with Leslie's photometer, in which light was measured when changed into heat by absorption, in the coloured glass of which one of the bulbs of his differential thermometer was formed.

Ordinary phosphorus (from which the phenomenon took its name) becomes luminous in the dark by slight friction; whence the common trick of drawing self-luminous figures on doors and walls with a stick of phosphorus, or an ordinary lucifer-match. A similar appearance is presented by putrescent animal matter, such as decaying fish, &c.; but these are effects of slow combustion, or chemical combination, and are not properly classed among the phenomena of phosphorescence. See LUMINOSITY OF ORGANIC BEINGS.

PHOSPHORUS (symb. P, equiv. 31, sp. gr. 1·826) is one of the metalloids, or non-metallic elements, although, in its combining relation, it is more closely connected with the metals arsenic and antimony than with any of the members of the sulphur-group, in which it is commonly placed.

This substance affords an excellent example of allotropy; that is to say, it may be made to occur under different forms presenting different properties. See ALLOTROPY.

Ordinary phosphorus and the red variety are the only important forms. We shall speak of them as phosphorus and red phosphorus respectively.

Phosphorus at ordinary temperatures is an almost colourless or faintly yellow solid substance, having the glistening appearance and the consistence of wax, and evolving a disagreeable alliaceous odour, which, however, is probably due to the action of the oxygen of the air upon it. It fuses at 111·5° into a colourless fluid; and if the air be excluded, it boils at 555°, and is converted into a colourless vapour of sp. gr. 1·826. If, however, it be heated to about 140° in the air, it catches fire, burns with a brilliant white flame, and is converted into phosphoric acid; and, indeed, it is so inflammable that it will catch fire at ordinary temperatures by mere friction. As the burns which it occasions are often severe and dangerous, great caution is required in handling it; and in consequence of the readiness with which it catches fire, and of its tendency to oxidise when exposed to the air at a temperature higher than 32°, it is always kept in water, in which it is insoluble. It is slightly soluble in ether, but dissolves freely in benzol, in the fixed and essential oils, and in bisulphide of carbon; and by allowing its solution in one of these fluids to fall upon filtering paper, the finely divided phosphorus absorbs oxygen so rapidly as spontaneously to catch fire as soon as the solvent has evaporated. One of the most characteristic properties of phosphorus is that it shines in the dark, probably from the slow combustion which it undergoes; and hence its name from the Greek words *phōs*, light, and *phōros*, bearing. Its power of forming ozone is noticed in the article on that substance. Taken internally, phosphorus is a very powerful irritant poison; and it is the active ingredient of some of the preparations employed for the destruction of vermin. Its fumes give rise to a peculiar form of necrosis of the jaw, which is very common amongst the makers of lucifer-matches, and is not followed, as in ordinary necrosis, by a formation of new bone.

Red phosphorus differs from the ordinary variety in several important points. It occurs as a deep red amorphous powder, which is perfectly devoid of odour, may be heated to nearly 500° without fusing, has a specific gravity of 2·10, does not shine in the dark, nor take fire when rubbed, undergoes no change on exposure to the air at ordinary temperatures, and is in all respects far less inflammable. Moreover, it is insoluble in bisulphide of carbon and the other fluids in which ordinary phosphorus dissolves, and is not poisonous. On this account, Schrötter (to whom we are mainly indebted for our knowledge of this modification of phosphorus) has attempted, although with imperfect success, to apply it to the formation of lucifer-matches. When red phosphorus is heated in an atmosphere of carbonic acid to a temperature of 500°, it is converted, without loss of weight, into ordinary phosphorus.

Phosphorus is never met with in nature in an uncombined state, but it occurs in small proportion as phosphate of lime in the primitive and volcanic rocks (as was first shewn by Fownes in 1844), by the gradual decay of which it passes into the soil; it is also found abundantly in the minerals known as *apatite* and *phosphorite*, and in the brown rounded pebbles which abound in the Norfolk Crag, and which, under the name of *codrolites*, are much employed, when crushed, for manure. From the soil, it is extracted by plants, which accumulate it

(especially in the seeds of the cereals) in quantity sufficient for the wants of the animals which they supply with food. In the animal system, phosphate of lime forms 57 per cent. of the bones; phosphates of the alkalies, especially of soda, occur freely in the animal fluids; and in silica, alumina, and various matters, phosphorus is universally present, although we do not clearly know in what form of combination it occurs.

Phosphorus was originally discovered in 1669 by Brandt, a Frankfort chemist, who obtained it from urine. Gahn and Scheele were, however, the first to discover its presence in bones, and to employ that material for its preparation. The following are the leading steps of the method now usually employed in obtaining it on the large scale. Bones are burned to whiteness, and powdered; and this bone-ash is then mixed with sulphuric acid in such quantity as partially to decompose the phosphate of lime occurring in the ash (CaO, PO_4) into insoluble sulphate of lime, and a soluble super-phosphate of lime, whose composition is represented by the formula $2\text{H}_2\text{O}, \text{CaO}, \text{PO}_4$. The solution of the super-phosphate is evaporated to a syrup, mixed with charcoal, and submitted to distillation in an earthen retort exposed to a red heat. Phosphorus rises in vapour, and is conveyed, by means of a bent tube, into water, in which it condenses in yellow drops. Two distinct processes take place within the retort. The first consists in the decomposition of the super-phosphate of lime into lime-ash and hydrated phosphoric acid; while the second consists in the decomposition, by means of the carbon, of the liberated phosphoric acid into phosphorus—a process accompanied by the evolution of hydrogen and carbonic oxide gases. After it has been pressed in a fused state through wash leather, and further purified, it is forced into tubes, in which it is allowed to solidify, and which give it the form of sticks, in which it is commonly met with.

Phosphorus forms with oxygen an oxide, P_2O (which is always produced in small quantity when phosphorus is burned in air, but is of no practical importance), and three acids—viz. hypophosphoric acid, P_2O ; phosphorous acid, P_2O_3 ; and phosphoric acid, P_2O_5 . Of these compounds, phosphoric acid is by far the most important, and we shall therefore consider it first in order of the three acids.

Phosphoric acid in its anhydrous state, or phosphoric anhydride, as it is usually termed at the present day, is represented by the formula P_2O_5 , and is obtained by burning phosphorus in a jar of perfectly dry atmospheric air or oxygen, when it is deposited in snow-white flakes at the bottom and on the sides of the jar, from whence it must be removed by means of a platinum spatula as quickly as possible, to prevent its attracting moisture from the atmosphere, and placed in a perfectly dry flask. When dropped into water, it combines with it, and dissolves, evolving a considerable amount of heat, and emitting a hissing sound, as when red-hot iron and water come together. In consequence of its strong affinity for water, this anhydride is very useful in the laboratory as a dehydrating agent.

There are three hydrates of phosphoric acid, each of which possesses the properties of a distinct acid—viz. a monohydrate (HO, PO_3), a dihydrate ($2\text{HO}, \text{PO}_3$), and a trihydrate ($3\text{HO}, \text{PO}_3$). These hydrates retain their characteristic properties when dissolved in water, and combine with one, two, or three equivalents of base to form salts, according to the hydrate employed. In the salts formed by the first hydrate, the one equivalent of water is replaced by one equivalent of base; in those formed by the second hydrate, both equivalents of water may be replaced by two of base, or one equivalent

of water alone may be replaced, while the other remains in the salt as basic water; while in those formed by the third hydrate, all three equivalents of water, or two, or only one, may be replaced by base, so that this acid forms three sets of salts. Hence phosphoric acid is what is termed a *polybasic Acid* (q. v.). The following scheme may elucidate this remark: If M, M', M'', are any three metals, whose oxides act as bases, the monohydrate HO, PO_3 forms the salt MO, PO_3 , and is monobasic; the dihydrate $2\text{HO}, \text{PO}_3$ forms the salts $\text{MO}, \text{M}'\text{O}, \text{PO}_3$ and $\text{MO}, \text{HO}, \text{PO}_3$, and is dibasic; the trihydrate $3\text{HO}, \text{PO}_3$ forms the salts $\text{MO}, \text{M}'\text{O}, \text{M}''\text{O}, \text{PO}_3$, $\text{MO}, \text{M}'\text{O}, \text{HO}, \text{PO}_3$, and $\text{MO}, 2\text{HO}, \text{PO}_3$, and is tribasic.

The occurrence of phosphorus and its state of combination in the three kingdoms of nature has been already noticed in our remarks on phosphorus. The discovery of the acid was made in 1780 by Marggraf; the discovery of its true chemical nature is, however, due to Lavoisier; and that of its various modifications and its polybasicity, to the investigations of our illustrious countryman, Berzelius.

Phosphorus Acid occurs both as an anhydride, P_2O_5 , and as a hydrate, $2\text{HO}, \text{PO}_3$. *Hypophosphorous Acid* (HO, PO_3) is only known in its hydrated condition, in which it occurs as a very acid, colourless, uncrystallizable syrup.

Phosphorus combines with hydrogen in three proportions to form phosphuretted hydrogen gas, PH_3 ; liquid phosphide of hydrogen, PH_2 ; and solid phosphide of hydrogen, P_2H_4 . Of these, the first alone requires notice in these pages. There are various processes for obtaining the gas, one of the simplest being by boiling fragments of phosphorus in a concentrated solution of hydrated potash, in which case, hypophosphite of potash is formed, while phosphuretted hydrogen gas is evolved. The reaction is explained by the equation, $4\text{P} + 3\text{HO}, \text{KO} = 3\text{KO}, \text{PO}_3 + \text{PH}_3$. The gas thus evolved is colourless, possesses a characteristic fetid odour, and has the remarkable property of taking fire spontaneously in atmospheric air or in oxygen gas, and of resolving itself into anhydrous phosphoric acid and water—a phenomenon of which Professor Miller has given the following graphic description: "If allowed to escape into the air in bubbles, each bubble as it breaks produces a beautiful white-wreath of phosphoric acid, composed of a number of ribbons revolving in vertical planes around the axis of the wreath itself as it ascends; thus tracing before the eye, with admirable distinctness, the rapid gyratory movements communicated to the superincumbent air by the bursting of a bubble upon the surface of a still sheet of water. If the bubble be allowed to rise into a jar of oxygen, a brilliant flash of light, attended with a slight concussion, accompanies the bursting of each bubble! There is reason to believe that perfectly pure phosphuretted hydrogen gas does not possess the power of igniting spontaneously, and that the self-igniting gas always contains a minute quantity of the vapour of the liquid phosphide (PH_2). The luminous phenomenon known as *Will-o'-the-Wisp* has been referred to the natural evolution of the gas; there is, however, no scientific evidence in favour of this hypothesis.

Various compounds of phosphorus with sulphur, chlorine, iodine, bromine, &c., have been formed and investigated; but none of them are of any practical importance.

The medicinal uses of phosphorus and phosphoric acid have still to be considered. Phosphorus, dissolved in ether or oil, was formerly prescribed in very minute doses as a stimulant to the nervous system in certain conditions. It is, however, now

upon it by different rays in the solar spectrum. His words are these (published in 1777): 'Fix a glass prism at the window, and let the refracted sunbeams fall on the floor; in the coloured light put a paper strewn with *luna cornea*, and you will observe that the horn silver grows sooner black in the violet ray than in any of the other rays.' Still more recently, the names of Wedgwood and Davy (1802), and of Niepce and Daguerre from 1814 to 1839, occur as followers in the path indicated by Scheele and the earlier savans; and in the early months of the present year (1864), the attention of the Photographic Society of London was occupied by the endeavour to establish the authenticity and true photographic character of some pictures found in the library of Matthew Boulton, and believed to be true sun-pictures by James Watt, the celebrated engineer; thus offering great probability that the mind which produced the wonders of steam-power, had also been engaged in the same investigations which have resulted in the present more extensive development of photographic science. Most of the experiments alluded to may be said to have been based upon the fact, that the salt of silver, called by the ancients *luna cornea*, and by modern chemists nitrate of silver, otherwise lunar caustic (from its use in medicine), is highly sensitive to the influence of light. But such observers must have been fully aware that this substance is not the only one affected by light, for it had been long noticed that the light of the sun does not fall upon any surface without leaving traces of its action thereon. It cannot be absorbed or reflected without in some way modifying the structure and properties of the exposed surface. Even the brick and stone of which our houses are built become blanched by its influence, and those portions on which the shadows of trees or other detached objects fall are perceptibly darker than those exposed to its full force; with the knowledge, therefore, of this all-pervading influence before their minds, the investigations of scientific photographers have been directed to the production of surfaces either of metal, paper, or glass, so imbued with chemical substances as to possess a maximum amount of sensibility to this subtle agent—light.

There seems but little doubt that some of the acute-minded men who investigated the phenomena of the influence of light must have made use of the beautiful invention of Baptista Porta of Padua, known as the Camera Obscura (q. v.); for the pictures of natural objects formed on the inner surface of this instrument would readily suggest its use in combination with the *luna cornea*. We know that, in the later period of the researches made on the subject, the camera was used, and that it has now been universally adopted. The earlier attempts to produce pictures by its means failed, however, in consequence of the want of a power of fixing the images produced by the lens. That want having, by means of chemical investigation, been supplied, the science of photography has become firmly established in its principles, and the practice of it as an art is diffused all over the civilised world. The honour of having been the first to produce pictures by the action of light on a sensitive surface is now very generally conceded to Thomas Wedgwood, an account of whose researches was published in 1802 in the *Journal of the Royal Institution*, under the title: 'An Account of a Method of copying Paintings upon Glass, and of making Profiles by the agency of Light upon Nitrate of Silver; with Observations by H. Davy.' In the experiments detailed in this communication, white paper and *white leather* were imbued with nitrate of silver, and exposed either in the camera obscura,

or under the leaves of trees or wings of insects. The result was, that the shadows preserved the parts concealed by them white, while the other parts became speedily darkened. The misfortune was, that no attempts made either by Wedgwood or Davy to prevent the uncoloured portions from being acted on by light (or, as we now say, to *fix* the picture), were successful. This operation was not effected in a thoroughly efficient manner until Sir John Herschel suggested the employment of hyposulphite of soda for that purpose. Many other fixing agents had been previously used, as ammonia, iodide of potassium, chloride of sodium, and bromide of potassium, suggested by Mr Fox Talbot; none of these, however, were found equal to the salt proposed and successfully used by Sir John Herschel.

M. Niepce of Chalon-on-the-Saone was the first to enjoy the satisfaction of producing *permanent* pictures by the influence of solar radiations. This was accomplished in 1814, and the name chosen to designate his process was heliography—a name in some respects preferable to photography. It consisted in coating a piece of plated silver or glass with a varnish made by dissolving powdered asphaltum to saturation in oil of lavender, taking care that the drying and setting of this varnish be allowed to take place in the entire absence of light and moisture. The plate so prepared was then exposed in the camera obscura for a length of time, varying from four to six hours! according to the amount of light. A faint image only is at first visible, and this is afterwards developed and fixed by immersion in a mixture of oil of lavender and oil of white petroleum; the plate being finally washed with water, and dried. Light has little or no action on these heliographs; they should, however, be protected from moisture. M. Daguerre improved on this process, by suggesting the use of the resins obtained by evaporating oil of lavender, whereby a great increase of sensibility was secured.

Adopting date of publication as the best evidence of discovery, the next process offering itself for consideration is that for photogenic drawing by Mr Henry Fox Talbot, communicated to the Royal Society on the 31st January 1839, just six months previous to the publication of Daguerre's process. It consisted in immersing carefully selected writing-paper in a weak solution of common salt, and drying it. After this, a dilute solution of nitrate of silver was spread over one side, and the paper again dried at the fire. When dry, it was fit for use, the sensitiveness being much increased by alternate treatment with saline and argentine solutions. Paper thus prepared yielded impressions in an incredibly short time, and nothing could be more perfect than the images it gave of leaves and flowers, the light passing through the leaves delineating every ramification of their nerves. Considerable improvement in point of sensibility was attained by Mr Talbot in the following year, 1840, by the employment of iodide of silver on paper, as a foundation, to be washed over with a mixture of aceto-nitrate and gallo-nitrate of silver, just previous to exposure in the camera. Paper so prepared was so sensitive that an exposure of less than a second to diffused light was enough to produce an impression. After exposure and development, the picture was washed, and fixed by immersion in a solution of bromide of potassium.

Niepce and Daguerre accidentally discovered that they were conducting experiments of a kindred character, and shortly afterwards entered into a partnership. The former, however, dying in July 1833, a new deed of partnership was signed between

PHOTOGRAPHY.

his own children and M. Daguerre, which resulted in the publication, in July 1839, of the process known as the Daguerriotype. This was not done, however, until the French government had passed a bill, granting to M. Daguerre a pension of 5000 francs, and to M. Louis-Nicolas, the son of the Niépces, a pension of 4000 francs, both for life, and one-half in reversion to their widows. This handsome reward on the part of the French government was based upon the argument, that 'the invention did not consist of being secured by patent, since, as soon as published, all might avail themselves of the advantage they, therefore, chose to enjoy the glory of rendering the world of science and of art with one of the most surprising discoveries that human their native land.'

The discovery of the Daguerriotype may be said to have arisen from the dissatisfaction entertained by Daguerre with the insensibility of the bituminous varnishes of Niépce, which induced him to turn his attention to the salts of silver as a means of producing a higher degree of sensitiveness. This he attained by exposing a highly polished plate of silver polished, for greater strength, to a copper plate to the vapour of iodine, by which pure iodide of silver was formed on the surface. The plate so prepared was exposed in the camera obscura for a month of time (20 minutes), which was then considered very short. No apparent effect was produced on the plate, the image being a latent one, arising from a minute molecular deterioration caused by the action of the iodine rays. The latent image was afterwards developed by exposing the plate to the vapour of mercury; and it is this development of a latent image, reducing as it did the time of exposure from hours to minutes, which truly constituted a new era in the science of photography. It is further due to Daguerre to state, that, while his processes for the purpose were imperfect, he still succeeded in taking fine pictures, although it was reserved for Sir John Herschel to announce the great suitability of the hyposulphites for dissolving the latent salts of silver. The sensibility of the silver plate was still further increased by Mr. Goodall, who suggested, in 1840, the association of the vapour of ammonia with that of iodine; while M. Claudet, in 1840, employed chlorine. It is a remarkable fact in connection with these discoveries, that the elder Niépce should, as early as 1829, have tried the treatment of silver plates with the vapours of sulphur and phosphorus.

But the progress of this interesting science received a very important impulse from a discovery, which at first scarcely appeared to have any connection therewith. In 1833, Berconnot gave, in the *Annuaire de Chimie*, an account of a new substance obtained by the action of nitric acid on starch, amygdal, linen, and cotton-wool. He named the substance Xylodine; it was very combustible, and burned almost without residue. In 1838, Pelouze, in the *Comptes Rendus*, suggested its application in artillery. He says, 'Flange paper sensitive and specific gravity 1.500, leave it in for two or three minutes, and wash; a kind of parchment is obtained, impervious to moisture, and extremely combustible.' Orsoni, in 1843, proposed the name Nitrocellulose, and suggested its use for fireworks. At a meeting of the British Association held at Southampton in the year 1846, Herr Schlenker, an eminent Prussian chemist, read a paper on the preparation of explosive cotton, a substance obtained by acting on ordinary corded cotton by a mixture of strong nitric and sulphuric acids. This explosive cotton was afterwards found to be soluble in ether; and the solution so prepared was named collodion by its discoverer, Mr. Maynard,

who, in 1844, published in the *American Journal of Medical Science*, the formula for its preparation. This ethereal solution having a certain proportion of alkaline iodides and iodide of silver added thereto constituted the collodion first employed by Mr. Archer, who, although desirous the credit of having first arranged a practicable working process with collodion for its basis, without which photography could not have attained its present high position, says, in the second edition of his *Manual*, 'It is due to Jaccard to say that he was the first to publish an account of collodion as a photographic agent;' thus illustrating the caution with which Mr. Archer admitted his claim to be considered the first to suggest its value in photography. Mr. William Horne and Mr. Fry materially assisted Mr. Archer in bringing his experiments to perfection. Although the announcement of the British Association in 1846, was to the effect that collodion had made cotton an explosive so propounding, no particulars were published. In April 1847, he obtained a patent; but in October 1848, Mr. Thomas Taylor had published a similar collodion to that patented. By one of those singular freaks of fortune which sometimes occur, Daguerre succeeded in identifying his name with his process; but Mr. Archer was not so fortunate as to give his name to the process which he invented. A reference to the article *Collodion* will show that (bearing in mind that glass perfectly cleaned forms the supporting medium) the sensitive surface is obtained by the conversion of the soluble iodides and bromides in the collodion film into iodide and bromide of silver by immersion in a solution of the nitrate of that base, and that it is exposed in the camera while still moist with adherent nitrate, the latent image so obtained being developed with a mixture of pyrogallol acid, acetic acid, and alcohol, fixed with hyposulphite of soda, and varnished.

In the Negrosotype or albumen process, glass plates of proper thickness and quality, and perfectly clean, are coated with Albumen (q. v.) to which an alkaline iodide has been added. When perfectly dry, they are immersed in a solution of nitrate of silver, when an immediate decomposition takes place; iodide of silver being formed in the albumen film, and nitrate of potash or ammonia remaining in solution. The plate is then freely washed with water, dried, exposed, developed with gallic acid, and fixed with hyposulphite of soda.

A retrospective glance will show the reader that four processes have now been passed in review; and on a little consideration, it will be seen that one principle pervades the whole—viz. the production of a latent image by the action of light on iodide and bromide of silver, its subsequent development by suitable means, and the final removal of the unaltered portions of the sensitive film by a fixing agent.

Among these processes, that in which collodion is employed has achieved a well-merited distinction, and is now so generally employed, as almost entirely to exclude the others. Various modifications of this process have been from time to time suggested to meet the exigencies of landscape photography. It has already been stated that the collodion film is exposed while still moist with adherent nitrate of silver solution; and this method is especially applicable to the taking of portraits, where it is desired to reduce the time of exposure to a minimum; but for landscape purposes, it is by no means so imperatively necessary to curtail the time of exposure; and as the necessary apparatus and materials for sensitising and developing a wet plate are somewhat cumbersome for field-work, it was suggested by the Abbé Desprats to wash off the free nitrate from the

PHOTOGRAPHY.

surface, and allow the film to dry in the absence of light. A number of sensitive plates can be prepared by this method in anticipation of a journey. This is called the 'Dry Collodion Process.' A plate so prepared is much inferior in point of sensitiveness to a wet plate, and this arises as much from an altered molecular condition of the iodide of silver as from the absence of free nitrate of silver. The Abbé Despratz introduced resin into his collodion, with the view of keeping the pores open. The pictures obtained by his process were, however, difficult to develop without stains; and a variety of agents have since been used, both from the organic and inorganic kingdoms, to preserve the film in the same molecular condition when dry as when wet. Among these may be mentioned nitrate of magnesia, honey, oxymel, and a host of other materials, such as sugar, albumen, infusion of malt, and lastly tannin, which last preservative agent bids fair to supersede all others.

The practice of photography in the present day is confined almost exclusively to the **POSITIVE**, the **NEGATIVE**, and the **DRY COLLODION PROCESSES**. In the *first*, the object is to obtain in the camera a direct image, which is to be viewed by reflected light; and as it is desired that the pictures so produced should possess pure blacks and whites, an inorganic (nitric) acid is used in the bath, and the developer—protosulphate of iron—is also of inorganic origin, these being the conditions best calculated to produce a deposit of pure white metallic silver. In the *second*, however, an image possessing density to transmitted light is required; accordingly, an organic (acetic) acid is used both in the bath and developer; and in order still further to insure an efficient supply of organic matter to combine with the silver at the moment of its reduction, pyrogallol acid is sometimes exclusively used. The *third* or dry process is distinguished from the preceding modifications of the wet process by the complete removal of the adherent free nitrate of silver, the application of a preservative agent, and the necessity for adding nitrate of silver to the developer.

It will be desirable, before concluding this article, to refer to some of the various applications of photography which have been made since the principles of the science have been well understood.

PHOTO-LITHOGRAPHY, the application of photography to engraving on stone. A lithographic stone is coated with a mixture of water, gum-arabic, sugar, and bichromate of potash, dried in the dark, exposed in the camera, or under a negative. The effect of the luminous action is to render the gum almost insoluble. A solution of soap is then applied, which serves the double purpose by its decomposition of yielding a greasy printing-surface, and by its solvent action to remove those portions unacted on by light: its action being inversely proportionate to the extent to which the gum was fixed by the light. In this condition, the stone is freely washed with water, and when dry, receives a coating of printer's ink from the roller, which, by uniting with the soap, gives additional body to the picture. This process was patented by Mr W. E. Newton; but, in common with others of a kindred character noticed in this section, the resulting pictures were invariably deficient in middle tint, possessing a degree of hardness very unpleasant to the eye, and satisfactorily accounting for its not coming into general use.

PHOTO-XYLOGRAPHY, the application of photography to wood-engraving. One process, patented by Mr Newton, consisted, first, in rubbing into the wood-block a varnish, composed of asphaltum, ether,

and lamp-black, to saturate the pores. Collodion was then poured on as in the ordinary Collodion process (q. v.). The surface was then sensitised, and exposed in the camera, the picture being developed in the usual way. But the desired success was not complete, for the thickness of the united films was found to interfere with the operations of the engraver, and the process, in consequence, did not receive general adoption.

W. Crookes, F.R.S., subsequently simplified the method of producing an impression on wood-blocks, by rubbing them over with a mixture of oxalate of silver and water, and exposing under a negative. The advantage of this process was, that it did not require any treatment of the block for the purpose of fixing after exposure, as if kept from the continued action of light, the block would keep long enough for the engraver to work out the details with his tools. It is fair to assume, notwithstanding the ingenuity displayed in these processes, that some insuperable objection exists in both of them, since neither have been adopted to much extent.

PHOTO-MICROGRAPHY consists in the enlargement of microscopic objects, by means of the microscope, and the projection of the enlarged image on a sensitive collodion film. The manipulatory details are the same as in the Collodion process (q. v.), only that, on account of the delicate nature of the markings to be rendered, it is necessary to employ a collodion yielding what is termed a structureless film. The principle upon which the enlargement is effected is that of the conjugate foci. This branch of microscopic and photographic science has proved a useful aid in the study of the sciences of Botany, Physiology, and Entomology, by delineating, with unerring accuracy, woody fibre, ducts, starch granules, muscular fibre, blood discs, nerve papillae, &c. Among the numerous experimenters attracted by this interesting study, Dr Maddox is perhaps the only one who has attained to any renown; and by him, minute animalcules, all but invisible by unassisted vision, have been magnified to a superficial area of three square inches, in which the most delicate details have been faithfully preserved. By reversing the arrangement necessary for these enlargements of microscopic objects, it will be seen that minute photographs of engravings, or other objects, may be produced which would require a microscope for their inspection, and it has been suggested that in this way war despatches might be transmitted in the setting of a ring or breast-pin; and this is really by no means so difficult to accomplish as it may seem at first sight, since photographs no larger than a pin's head have been produced, including in that small space portraits of no less than 500 eminent men.

CELESTIAL PHOTOGRAPHY comprehends the application of photography to the automatic registration of celestial phenomena. The labourers in this field of scientific research have been numerous both in America and Europe; the name of Mr Warren de la Rue, however, stands out so prominently before all others, that in the limited space at command, it is scarcely necessary to do more than notice the leading facts established by his researches. Not the least interesting of these is the demonstration of the sphericity of the moon by means of the stereoscope and lunar photographs, also the determination of the nature of many of the more obscure markings on its surface, by which elevations are clearly distinguished from depressions. The facule or spots on the sun's surface have also been photographed, and examined stereoscopically, by which they have been found to arise from elevations of the outer regions of the photosphere. Photographs

PHOTO-LITHOGRAPHY—PHOTO-SCULPTURE

have been those of Lyræ and Cæter, and of the whole of Greece. The instrument employed for the purpose is called a *Photo-heliograph*.

Photo-lithography, a method of producing from a photograph an electrotypic copperplate in a case fit for printing. It was invented by Mr. Paul Preuss of Vienna, and is dependent on the property which uncoloured gelatine possesses of swelling up in water. In order that a plate should be fit for engraving it is of course essential that it should have on its surface elevations and depressions corresponding to the lights and shadows of the pattern. Accordingly, the first operation consists in covering a glass with a solution of gelatine and bicarbonate of potash, and when this is dry, exposing the same to light under a negative. In accordance with the above-mentioned property of gelatine, it will be found, on applying water to the film, that the portion touched or will swell up, while those parts from which the actinic rays have been excluded their full thickness will remain unchanged by the water; from the same time obtained, a gutta-serena mould is prepared, and the surface made conducting by means of levigated graphite or brown-powder. Copper is then deposited thence by the electrotypic process, and the plate thus produced is printed from in the ordinary way.

Photo-thermography is a process, invented by Mr. Fox Talbot, for etching a photograph into a steel plate. It consists in coating the plate with a solution of bichromate of potash and gelatine, and exposing under a negative. The effect of this treatment is to render the gelatine insoluble, just in proportion to the intensity of the light's action, after which a solution of perchloride of iron, of a certain definite strength, is poured over the film, which solution penetrates those parts masked on by light, reaching the steel plate, and biting itself in. It is repelled by that portion of the gelatine rendered insoluble; the plate being thus protected from the action of the solvent. Because a dilute solution of perchloride of iron sinks into a film of gelatine more readily than a strong solution, it is very important that the etching fluid should possess just amount of dilution which has been found by practice to yield the best results.

PHOTO-LITHOGRAPHY. See **PHOTOGRAPHIC ENGRAVING, PHOTOGRAPHY.**

PHOTOMETER (Gr. *phôs*, light; *metron*, measure), an instrument for measuring the intensity of light. The first who occupied himself in scientifically determining the intensity of light was Breguer; but his investigations were far surpassed by those of Lambert, about 1760. The latter introduced an exceedingly simple and effective kind of photometer, which was afterwards constructed by Romberg. The instrument consists of a screen of thin paper placed vertically, and behind it, at the distance of a few inches, is placed a cylindrical stick, or any other similar body. When the intensity of light from two flames is to be compared, they are placed behind this stick in such a way that each casts a separate shadow of the stick upon the paper screen. The observer stands in front of the screen, and directs the removal of the two lights either to or from the stick, till the shadows which are cast upon the screen are equally obscure. The distance of each light from the shadow it casts on the screen is then measured, and the squares of these distances give the relative intensities of the two lights. This photometer may also be modified by employing, instead of a cylindrical stick, a second screen parallel to the first, but of greater thickness, and having an aperture cut in its centre. The two lights being then placed behind the second screen,

and considerably apart, each casts a separate illumination through the aperture in the second upon the first screen, and the observer in front of the latter changes their relative distances till the illuminations appear to the eye of equal intensity. The calculation is the same as before. There are several other classes of photometers, which, however, do not deserve the name, as they depend upon the heating and chemical powers which generally accompany light, and not upon the intensity of its action on the organs of vision. Thus, Leslie's instrument is nothing more than a differential thermometer, while Rumour's and Lamière's depend upon the chemical effects of light. Tan-pulius, instead of estimating the illumination from the different distances of the lights from the screen, used plates of horn, or other semi-transparent material, of various thicknesses, and deduced his results from the comparative thickness of the two plates. The results attained by the aid of the photometer, owing to the imperfection of the instrument, are to be relied upon only within certain limits. Some of them are as follows: the light of the sun is 94,000 times greater than that of the moon, and an ordinary Argand lamp, with cylindrical wick, is equal to nine newly-trimmed candles.

PHOTO-SCULPTURE, a new art, invented, during the present year, by M. William, a Frenchman. It has been introduced into Great Britain, and is successfully practised by M. Chaudet in London, and a society has been formed for carrying it out in Paris. It consists in taking likenesses in the form of statues and medallions by the aid of photography, and a very ingenious series of accessory contrivances. A building specially adapted for the purpose is absolutely necessary; this consists of a circular room, 40 feet in diameter, and surrounded by a glass cylinder 22 feet high, the supporting wall being about 5 feet in height, and pierced with 24 equidistant holes about 4 feet from the floor; these are only sufficiently large to permit the action of an ordinary camera lens through each one. Outside the surrounding wall of this circular chamber is a covered dark passage, in which twenty-four cameras are placed with their lenses adjusted

Fig. 1.

to the holes in the wall. The person whose likeness is to be taken stands in the center under the glass dome, and at a given signal the cameras are simultaneously brought into action, and a photograph is taken. The whole of this arrangement will be fully understood by reference to fig. 1.

The twenty-four photographs are carefully numbered, so that no error can take place in the

subsequent operation, which is performed in another chamber: any room which can be darkened will do. It consists in placing them in consecutive order on a

Fig. 2

vertical wheel, which is so arranged that at the will of the operator each one can be brought before the lens of a magic lantern, and its image projected on a

transparent screen, as in fig. 2. The modelling clay is so placed, rather behind the screen, that the artist can use a pantograph, which has its reducing point armed with a moulding or cutting tool instead of a mere marker; and as the longer arm of the instrument describes the outline of the projected figures obtained from the photographs, the shorter one is reproducing on a smaller scale the figure in the clay. The statuette thus produced requires retouching with the hand to remove the sharp and rugged lines of the cutting-tools, and of course much depends upon artistic skill in doing this. In the skilled hands which have yet had to do with its operations, the arrangement has had so marked a success as to promise to produce in time the most satisfactory results.

PHOTO-ZINCOGRAPHY. See **PHOTOGRAPHIC ENGRAVING.**

PHRAGMITES. See **REED.**

PHRASE, the name given, in Music, to the simple motives containing in themselves no satisfactory musical idea, which enter into the composition of every melody containing a perfect musical

idea, e. g.,  The phrase

most usually consists of two measures; in compound time, it may be comprised in one measure, and an extended phrase is one which contains three measures. In the more simple and regular forms of musical composition, two phrases unite to form a section ending in a cadence; and a perfect musical idea is formed of two such sections terminating, the first with the dominant, the second with the tonic harmony.

A little confusion has arisen from the use, by some musical writers, of the word phrase for what is here called a section.

PHRENI'TIS. See **MENINGITIS.**

PHRENOLOGY is a Greek compound signifying a discourse on the mind, but is used in a more limited sense to mean a theory of mental philosophy founded on the observation and discovery of the functions of the brain, in so far as it is concerned in intellectual and emotional phenomena. Phrenology takes into view likewise the influence of all other parts of the body, and of external agents affecting these, upon the brain.

The founder of this system was Dr Franz Joseph Gall (q. v.), who died in 1828. In Britain, it has been amply expounded by his pupil Dr Spurzheim (q. v.), by George and Andrew Combe (q. v.), by Dr Elliotson of London, and others. In America, Dr Charles Caldwell has been its ablest advocate. Gall's method of investigating the functions of the brain is that which, applied to other organs, has led to the discovery of their functions, but which had never before been systematically applied to the brain. When a physiologist wished to ascertain the function of any part of the body, he did not rest satisfied with examining its structure, and speculating on the purposes for which that structure seemed to be

aligned. He observed what kind of function organs during life he had, inevitable consequences of the pressure and action of that particular part; and, by repeated and careful observation, he arrived at the discovery of the functions. The knowledge thus obtained was afterwards verified and completed by examination of the structure, and observation of the effects of its injury or disease. To the adoption of this principle in studying the functions of the brain, Gall was led by observing that the concomitance of a quick and relative memory of words with a peculiar appearance of the eye, which he afterwards found to be caused by a large development of a particular part of the brain. At school, at college, and in many other places, and under the most different circumstances, he saw concomitance of talent with development of brain parts under his notice as frequently, as to suggest to him the probability that there might be discovered by the same method a connection of some talents and dispositions with other portions of the brain. It was by the diligent application of the method of inquiry which Gall had thus suggested to him, and not, as some suppose, by the exercise of his imagination, that Dr Gall was at last led to conclude, first, that the brain is an aggregate of many different parts, each serving for the manifestation of a particular mental faculty; and, secondly, that, all other conditions being equal, the size of each of these cerebral organs is a measure of the power of its function. These two propositions constitute the distinctive or fundamental principles of Phrenology. The first of them, however, is not new. The impossibility of reconciling what phenomena with the notion of a single organ of the mind has, for many centuries, suggested the probability of a plurality of organs in the brain. But the phrenologists held that Dr Gall was the first to demonstrate the fact, and to make any considerable progress in determining with what parts of the brain the various intellectual and emotional faculties and sensibilities are connected.

That man, in his present state, cannot think, will, or feel without the intervention of the brain, is generally admitted by physiologists, and appears from even the fact that, by pressure applied to it, consciousness is at once suspended. That it is not a single organ is a priori provable from such considerations as these: 1. It is a law in physiology that different functions are never performed by the same organ. The stomach, liver, heart, eyes, ears, have each a separate duty. Different nerves are necessary to motion and feeling, and there is no example of confusion amongst them. 2. The mental powers do not all come at once, as they would were the brain one organ. They appear successively, and the brain undergoes a corresponding change. 3. These powers in different individuals; one has a few, as it is called, for one thing, and another for something different. 4. Dreaming is explained by the doctrine of distinct organs which can act or not alone. 5. Partial insanity, or madness on one point with sanity on every other, similarly points to a plurality of cerebral organs. 6. Partial injuries of the brain, affecting the mental manifestations of the injured parts, but leaving the other faculties undisturbed, tend to the same conclusion. 7. There could be no such state of mind as the familiar one where our feelings contend with each other, if the mind were one organ.

There are grounds for presuming that the brain is not simple, but a cluster of organs, or at least that it is capable of acting in parts as well as in whole. Yet the conclusion the phrenologists consider that they have found satisfactory proofs in numerous observations, showing that particular manifestations

of mind are proportioned, in intensity and frequency of occurrence, to the size or expansion of particular parts of the brain—that law being subject to modification in the case of the brain, as in that of the muscles and other parts of the body, by differences of health, quality, exercise, &c.

If size of organs, *velut pendula*, is the measure of the vigour of function, it is of great moment to what region of the brain the organs are largest—whether in the animal, moral, or intellectual. On this preponderance depends the character. Two brains may be nearly alike in size generally, yet the characters may be perfectly contrasted to each other.

It is held by phrenologists—1. That by accurate observation of human actions, it is possible to discover the strength of the dispositions and intellectual powers of man; 2. That the form of the brain, as in normal subjects not forced into such a position as to be sustained with sufficient accuracy from the outward form of the head—the form, though the same substance, being what determines the scope of the skull; 3. That the organs or parts of which the brain is composed appear on its surface in folds or convolutions, which have a well-ascertained fibrous connection with the *medulla oblongata*, which unites the brain to the spinal cord; 4. That the brain being divided into two equal parts called *hemispheres*, in each of which the same organ occurs, all the organs are double, like the ears and eyes. See *Brain*. But when the brain organ is used, both organs are used.

It is true that where strength is most needed, the skull is thicker than at other places; but this is not overlooked by phrenologists nor do they fail to warn observers against mistaking for signs of cerebral development the bony processes and ridges which serve for the attachment of muscles to the skull. See *Skull*. They recognize also, as we shall see, the uncertainty often occasioned by the frontal sinus.

Besides the brain proper, there is a smaller brain, lying below the hinder part of the main brain, and called the *cerebellum*.

The brain is divided into the anterior, middle, and posterior lobes. The anterior lobe contains the organs of the intellectual faculties; the posterior lobe and lower range of the middle one are the regions of the animal propensities; while the moral sentiments are stated to have their organs developed on the top or coronal region of the brain.

Phrenologists distinguish between *power* and *activity* in the mental faculties. Power, in whatever degree possessed, is *capacitv* of feeling, perceiving, or thinking; while activity is readiness and quickness in the exercise of power.

The powers of mind, as manifested by the organs, are called *faculties*. A faculty may be defined to be a particular power of thinking or feeling. A faculty is regarded as elementary or primary—1. When it exists in one kind of animal, and not in another; 2. When it varies in the two sexes of the same species; 3. When it is not in proportion to the other faculties of the same individual; 4. When it appears earlier or later in life than the other faculties; 5. When it may act or repose singly; 6. When it is propagated from parent to child; and 7. When it may singly preserve its soundness, or singly become deranged or extinct.

The faculties are usually divided by phrenologists into two orders—*FEELINGS* and *INTELLECT*, or *APPETITES* and *INTELLECTUAL FACULTIES*. The Feelings are divided into two genera—the *Propensities* and the *Sentiments*; while the Intellectual embraces the *Perceptive or Knowing*, and the *Reflective Faculties*. This classification, however, is broadly imperfect.

PHRENOLOGY.

The following is a representation of the human head in four points of view, shewing the positions of the cerebral organs, according to Mr Combe :

AFFECTIVE.

I.—PROPSITIES.

1. Amativeness.
2. Philoprogenitiveness.
3. Inhabitiveness or Concentrativeness.
4. Adhesiveness.
5. Combativeness.
6. Destructiveness. [Alimentiveness.] [Love of Life.]
7. Secretiveness.
8. Acquisitiveness.
9. Constructiveness.

II.—SENTIMENTS.

10. Self-esteem.
11. Love of Approbation.
12. Cautiousness.
13. Benevolence.
14. Veneration.
15. Firmness.
16. Conscientiousness.
17. Hope.
18. Wonder.
19. Ideality.
20. Wit, or Ludicrousness.
21. Imitation.

INTELLECTUAL.

I.—PERCEPTIVE.

22. Individuality.
23. Form.
24. Size.
25. Weight.
26. Colouring.
27. Locality.
28. Number.

29. Order.
30. Eventuality.
31. Time.
32. Tune.
33. Language.

II.—REFLECTIVE.

34. Comparison.
35. Causality.

1. *Amativeness*, or sexual love, is believed to have for its organ the cerebellum; or at least a portion of it. As the basis of domestic life, this faculty is of great importance, and its regulation has ever been one of the prime objects of moralists and legislators.

2. *Philoprogenitiveness*, or love of offspring, is generally strongest in the female. Its organ is one of the easiest to distinguish in the human head. Those who are flat and perpendicular there, instead of being delighted, are annoyed by children. The feeling is said to give a tender sympathy with weakness and helplessness in general. The most savage races must have affection for their young, or they would become extinct. The organ, like the other cerebral parts, may become diseased; and insanity on the subject of children often occurs.

3. *Inhabitiveness* (called by Mr Combe *Concentrativeness*) has its organ immediately above the preceding. Dr Gall did not discover its function; and Dr Spurzheim, observing it large in persons attached to their native place, or any place in which they had long dwelt, called it *Inhabitiveness*. Mr Combe thought it has a more extended sphere

of action. He observed it large in those who can detain continuously their feelings and ideas in their minds; while the feelings and ideas of others pass away like the images in a mirror, so that they are incapable of taking systematic views of a subject, or concentrating their powers to bear on one point. The organ is stated as only probable, till further facts are obtained.

4. *Adhesiveness*.—The organ of this feeling was discovered by Gall, from being found very large in a lady remarkable for the warmth and steadiness of her friendships. It attaches men and gregarious animals to each other, and is the foundation of that pleasure which mankind feel in bestowing and receiving friendship, and in associating with each other. Acting with *Amativeness*, it gives constancy and duration to the attachment of the married. Generally speaking, *Adhesiveness* is strongest and its organ largest in woman.

5. *Combativeness*.—Dr Gall discovered the organ of this propensity by a vast number of observations on the heads of persons fond of fighting. Dr Spurzheim extended its function to contention in general, whether physical or moral. Those deficient in it shew that over-gentle and indolent character which yields to aggression, is easily repelled by the appearance of difficulty and trouble, and naturally seeks the shades and eddy-corners of life.

6. *Destructiveness*.—The propensity to destroy is abundantly manifested by man and carnivorous animals, and when too strong or ill-regulated is the source of cruelty and wanton mischief. As a defensive power, it is of high utility. Anger, resentment, and indignation spring from it. A small endowment is one of the elements of a 'soft' character; while persons who have much of it are generally marked by an energetic, and probably fierce and passionate character.

Alimentiveness and *Love of Life*.—Some of the recent phrenological works treat in this part of the order of the faculties, of a faculty of *Alimentiveness*, or the propensity to eat and drink, and also of another which follows—viz., *Love of Life*. The first being represented as no more than *probable*, and the second as only *conjectural*, they have no number allotted to them on the bust. The place assigned to *Alimentiveness* is marked by a cross on the side-view of the bust. Mr Combe suggests that the organ of the *Love of Life* is probably a convolution at the base of the middle lobe of the brain, the size of which cannot be ascertained during life.

7. *Secretiveness* is the propensity to conceal, which in excess assumes the form of cunning. It helps animals both to avoid and to prey upon each other. In abuse, it leads to lying, hypocrisy, and fraud, and with *Acquisitiveness* disposes to theft and swindling. The organ is subject to disease, and cunning madmen are difficult to deal with. Disease here often leads to belief in plots and conspiracies formed against the patient.

8. *Acquisitiveness*.—The existence of a cerebral organ for the desire of property is held by phrenologists to prove that this is not, as many have thought, a derived or secondary tendency. It is what Lord Kames calls the 'hoarding appetite.' This explains the miser's desire to accumulate money, without regard to its use in the purchase of other enjoyment. When the organ is diseased, persons in easy circumstances are sometimes prone to pilfer everything of value, and often of no value, which comes in their way.

9. *Constructiveness* is the impulse to fashion and construct by changing the forms of matter. Many of the inferior animals possess it, as the beaver, bee, and birds. Physical nature consists of raw

materials which Constructiveness perceives and makes use to adapt to his purposes.

10. *Depression* is the source of that self-same power which enhances the pleasure of life, gives the individual confidence in his own powers, and induces him to apply them to the best advantage. It is sometimes called proper pride, or self-respect, in which form it aids the moral sentiments in resisting temptations to intemperance and vice. Its tendency renders a man too humble, and the world too big as his need, and push him aside. Its excess produces arrogance, selfishness, dissimulation, and revenge. Self-esteem becomes intense perhaps more frequently than any other faculty, and then shows itself in extravagant notions of self-importance. Each nation fancy themselves large, vigorous, and even the Empire being. The organ is generally larger in men than in women; and more men are insane from pride than women.

11. *Love of Approbation* is the desire of the good opinion, education, and praise of others. It is an excellent guard upon morals as well as manners. The loss of character, to those largely endowed with it is worse than death. If the moral sentiments be strong, the desire will be for honest fame, but in most characters, the love of glory is a passion that has deluged the world with blood in all ages. Shamelessness is the effect of its deficiency, often observed in criminals. The organ attains its greatest development in women than in men, as it seems to be more active than in the other sex generally.

12. *Contentiousness*.—The organ of this faculty is found large in persons much troubled with fears, suspicions, and doubts. Its moral character is well expressed by its name. When diseased, as it often is, the organ produces a conscious dread of evil, despondency, and often suicide.

13. *Jealousy* is the desire to increase the happiness and lessen the misery of others. When strong, it prompts to active, laborious, and continued exertions, and unless dissipatedness be powerful, is almost giving to promote its favourite object. It is regulated by Constructiveness and Intellect. Some persons dependent upon praise, profusion and facility. It often concurs with Hostility in great force; as it did in Hann, whose power on a wounded man expresses both feelings highly excited.

14. *Disposition* has for its object esteem and esteem is almost inseparable by the individual. One man reveres a man another treats with indifference, because his understanding leads him to consider that particular object as venerable, while his neighbor deems it otherwise. Not any man with a large subtrunk of the organ will have a tendency to consider others as superior to himself. Veneration is the basis of loyalty, and, having the Duty for its highest object, forms an element in religious belief. The field of its organ is those that high moral sentiment is one of the most common forms of intensity.

15. *Excitement* is the source of hostility, intemperance, perseverance, and determination; when too powerful, it produces challenge, vindictiveness, and infatuation. The want of it is a great defect in character. The English soldier is more persistent than the French, although in courage and spirit they are equal.

16. *Conscientiousness* gives the love of justice, but intellect is necessary to show on which side justice lies. The judge must hear both sides before deciding, and his very wish to be just will prompt him to do so. Conscientiousness not only curbs our passions when too powerful, but stimulates those that are too weak, and induces us to duty even against strong inclinations. The conscience of

Conscientiousness as an independent element in the human constitution, explains some apparent inconsistencies in human conduct.—that a man, for instance, is kind, forgiving, even devout, and yet not just. The organ is commonly larger in Europeans than in Asiatics and Africans; very generally, it is deficient in the savage brain. When it is diseased, the insanity consists in morbid self-reproach, belief in imaginary debts, and the like.

17. *Hope* was regarded as a primary faculty by Spurzheim, but was never admitted by Gall, who considered it as a function of every faculty that desires. Dr Spurzheim answered, that we desire much of which we have no hope. It produces gaiety and cheerfulness, looks on the sunny side of everything, and paints the future with bright colors. When not well regulated, Hope leads to bad speculation, and, in combination with Acquisitiveness, to gambling, both at the gaming-table and in the counting-house. It tends to make the individual conscious of personal good, and often delusory.

18. *Fancy*.—Dr Gall found the organ of this faculty large in some of visions and dreamers of dreams, and in those who love to dwell on the marvellous, and easily believe in it. Persons who have it powerful are fond of news, especially if striking and wonderful, and are always expressing astonishment; their reading is much in the region of the marvellous, tales of wonder, of enchanters, ghosts, and witches. When the sentiment is excessive or diseased, it produces that peculiar fanaticism which attempts miracles, and (with language active) speaks in unknown tongues.

19. *Ideality*.—The organ of this faculty was discovered by Dr Gall to be prominent in the faces and portraits of dreamers, and in the heads of a great number of living poets. This sentiment to him the old classical adage that the poet is born, not made. He called it the organ of Poetry. The name of Ideality was given to it by Dr Spurzheim. This faculty is said to delight in the perfect, the exquisite, the beautiful, the beautiful and sublime. The organ is usually small in criminals and other coarse and brutal characters, for it is essential to refinement. It prompts to elegance and ornament in dress and furniture, and gives a taste for poetry, painting, statuary, and architecture. A point of intersection is placed on the bust on the back part of the region of this organ, conjectured to be a different organ, but one allied to Ideality. The existence of the faculty of Ideality is held by phrenologists to prove that the sentiment of beauty is an original emotion of the mind, and to settle the controversy on that subject. See *Ferruccio*.

20. *Will, or the Sentiment of the Endurance*.—The phrenological writers have discussed at great length, and with not a little controversy, the metaphysical nature or analysis of this faculty. We need not follow them into this inquiry, as most of them are agreed that by means of it we feel and enjoy the *indurata*.

21. *Imitation*.—Dr Gall found the prominence of this organ accompanied by imitative, and often irrepressible mimicry. The tendency to imitate is evidently innate; from the earliest years, it makes the young follow the customs and the manner of speech of those around them, and so preserve a convenient uniformity in the manners and external acts of society. Celebrated actors always possess it strong, and by its means imitate the supposed manner, and even feel the sentiments, of their characters. The organ is found large also in painters and sculptors of menaces. In the morbid states, the impulse to mimic becomes irresistible.

We now come to the Intellectual Faculties, or

those which make us acquainted with things that exist, and with their qualities and relations. Dr Spurzheim divided them into three genera—1. The External Senses; 2. The Internal Senses, or Perceptive Faculties; 3. The Reflecting Faculties.

The external senses, as generally received, are five in number—*Touch, Taste, Smell, Hearing, and Sight*. There seem to be two more—namely, the *Sense of Hunger and Thirst*, and the *Muscular Sense*, or that by which we feel the state of our muscles as acted upon by force and resistance. Without this last sense, we could not keep our balance, or suit our movements to the laws of the mechanical world. Whether each sense has a special cerebral organ in addition to its external apparatus and nerves, is a question regarded by phrenologists as still undetermined.

22. *Individuality*, the first in the list of the perceptive faculties, is not easily defined. It is said to take cognizance of individual objects as such, e.g., a horse or a tree. Other knowing faculties perceive the form, colour, size, and weight of the horse, but Individuality is thought to unite all these and give the idea of a horse. It is regarded as the storehouse of knowledge of things simply existing. When it is strong, without being accompanied by reflecting power, the mind is full of facts, but unable to reason from them. After puberty, the size of the organ of Individuality, as well as of the neighbouring organs of Size, Weight, Colouring, and Locality—all situated behind the superciliary ridge of the skull—is often rendered doubtful by the existence of a hollow space, of uncertain width and extent, between the two plates of the skull. This hollow is called the *frontal sinus*; and when it is large, there may be a great projection of the bone over the eyes, without a corresponding projection of brain within. When this part of the skull is flat, however, the organs must be at least as defective as the flatness indicates. Owing to the source of uncertainty here pointed out, and the smallness of the organs behind the eyebrows, the functions of those parts of the brain are not regarded as being so well ascertained as those of the larger organs, nor will a cautious phrenologist be too ready to pronounce them large.

23. *Form*.—When the organ of Form is large, the eyes are wide asunder. Dr Gall discovered it in persons remarkable for recognising faces after long intervals, and although perhaps only once and briefly seen. The celebrated Cuvier owed much of his success in comparative anatomy to his large organ of Form. Decandolle mentions that 'his [Cuvier's] memory was particularly remarkable in what related to forms, considered in the widest sense of that word; the figure of an animal seen in reality or in drawing never left his mind, and served him as a point of comparison for all similar objects.'

24. *Size*.—Every object has size or dimension; hence a faculty seems necessary to cognize this quality. The supposed organ is situated at the inner extremities of the eyebrows, where they turn upon the nose. A perception of size (including distance) is important to our movements and actions, and essential to our safety.

25. *Weight*.—A power to perceive the different degrees of weight and force is likewise essential to man's movements, safety, and even existence. Phrenologists have generally localised the organ of that power in the part of the brain marked 25 on the bust.

26. *Colouring*.—The organ of this faculty is large in great painters, especially great colourists, and gives an arched appearance to the eyebrow; for example, in Rubens, Titian, Rembrandt, Salvator

Rosa, and Claude Lorraine. In cases of colour-blindness, it is found small. Many persons, though able to distinguish colours, have no perception of their harmonies: for this perception, a higher endowment of the faculty seems to be required.

27. *Locality*.—Dr Gall was led to the discovery of this faculty by comparing his own difficulties with a companion's facilities, in finding their way through the woods, where they had placed snares for birds, and marked nests, when studying natural history. Every material object must exist in some part of space, and that part of space becomes place in virtue of being so occupied. Objects themselves are cognized by Individuality; but their place, the direction where they lie, the way to them, fall within the sphere of Locality. Its organ is large in those who find their way easily, and vividly remember places in which they have been. It materially aids the traveller, and is supposed to give a love for travelling. The organ was large in Columbus, Cook, Park, Clarke, and other travellers.

28. *Number*.—The organ of this faculty is placed at the outer extremity of the eyebrows and angle of the eye. It occasions, when large, a fullness or breadth of that part of the head, and often pushes downwards the external corner of the eye. When it is small, the part is flat and narrow between the eye and the temple. Dr Gall called the faculty *le sens des rapports des nombres* (the Sense of the Relations of Numbers), and assigned to it not only arithmetic, but mathematics in general. Dr Spurzheim more correctly limits its functions to arithmetic, algebra, and logarithms; geometry being the products of other faculties, particularly Size and Locality. Dr Gall first observed the organ in a boy who could multiply and divide, mentally, ten or twelve by three figures, in less time than expert arithmeticians could with their pencils. Many such examples are on record.

29. *Order*.—The organ of this faculty is said to be large in those who are remarkable for love of method, neatness, arrangement, and symmetry, and are annoyed by confusion and irregularity. In savages, whose habits are slovenly, filthy, and disgusting, the organ is comparatively small.

30. *Eventuality*.—The organ is situated in the very centre of the forehead, and when large, gives to this part of the head a rounded prominence. Individuality has been called the faculty of *nouns*; Eventuality is the faculty of *verbs*. The first perceives merely things that exist; the other, motion, change, event, history. The most powerful *knobs* of minds have a large endowment of both Individuality and Eventuality; and such persons, even with a moderate reflecting capability, are the clever men in society—the acute men of business—the ready practical lawyers. The organ of Eventuality is generally well developed in children, and their appetite for *stories* corresponds.

31. *Time*.—Some persons are called walking time-pieces; they can tell the hour without looking at a watch; and some even can do so, nearly, when waking in the night. The impulse to mark time is too common, too natural, and too strong, not to be the result of a faculty; it is an element in the love of dancing, almost universal in both savage and civilised man.

32. *Tune*.—The organ of Tune is large in great musicians; and when it is small, there is an utter incapacity to distinguish either melody or harmony. The great bulk of mankind possess it in a moderate endowment, so as to be capable of enjoying music in some degree. Those in whom it is large and active, become, in all stages of society, distinguished artists, exercising a peculiar power over their

follow—sensations, as as to taste, smell, warmth, and gravity, as at pleasure. But the gift, in this active form, is liable to be much modified according as it is accompanied by Adhesiveness, Combativeness, Ideality, Benevolence, Wit, and other faculties.

25. *Imagination*.—The comparative facility with which different men obtain their thoughts in words, and learn to repeat them by heart, depends on the size of the organ of Imagination, which is situated on the superior-occipital plate, immediately over the occipital, and, when large, points the eye upwards, and sometimes downwards, producing, in the latter case, a wrinkling or purling of the lower eyelid. Verbal memory is strong or weak, without relation to the strength or weakness of the memory of things, forms, or numbers.

The Perceptive Organs are for the most part called into activity by external objects; but internal causes often excite them, and objects are thus perceived which have no external existence; but wrong, nevertheless, the individual may believe to be real. This is the explanation of visions and dreams, and of the fact that two persons never see the same system at the same time. Keenness of vision in the organs of Wonder predisposes to belief in the marvellous and supernatural, and probably stimulates the Perceptive Organs into action, when spectral visions are the consequence.

26. *Comparison*.—Dr Hall discovered the organ of this faculty in a man of science who reasoned chiefly by means of analogies and comparisons, and rarely by logical deductions. The middle of the upper part of his forehead was very prominent. The peculiar nature of the faculty has been much disputed among phrenologists, but they seem to agree that the perception of analogy depends upon it. Every faculty, we are told, can compare its own objects; Colouring can compare colours; Weight, measure, form, forms, Time, sounds; but Comparison can compare a colour with a note, or a form with a weight, &c. Analogy is a comparison not of things, but of their relations.

27. *Identity*.—This is regarded as the highest and noblest of the intellectual powers. Dr Spurzheim is pained by believing that it breeds the connection between cause and effect, and renounces the relation of ideas in each other in respect of necessary consequence. Some metaphysicians have held that we have an idea of cause, but not only sequence, or one event following another. Ben Cayce. It is true that we do see sequence; but we have a third idea. That of power, agency, or efficiency, existing in some way in the antecedent, so produce the consequent. Whence do we get this third idea?—from a distinct faculty, Causality. It is a large ingredient in wisdom.

The phrenologists have chiefly confined their attention to the organs of the brain, and the various faculties of which these are the instruments. The famous writers on mind—Bent, Stewart, Brown, and others—agree, on the contrary, their chief care to the mental acts called Attention, Perception, Conception, &c., which they considered as faculties. The phrenologist does not overlook the importance of the department of mental philosophy, but differs from the metaphysicians in considering perception, conception, memory, &c., as only modes in which the real faculties above described act. This distinction is one of great importance.

According to the phrenologists, the faculties are not mere passive susceptibilities; they all tend to action. When duly active, the actions they produce are proper or necessary; in excess or alone, they are improper, vicious, or criminal. Small mind cannot do not produce actions; but they are

unable to prevent the action of the animal organs, as they tend to do; thus small Benevolence is not acted, but it does not offer sufficient control to destructiveness, which then engages in every *destructive period*, later organs have the greatest, not small the least tendency to act—each faculty producing the feeling or idea peculiar to itself. In active constitutions, the brain partakes of the general activity, and hence more readily into play than where the constitution or temperament is lymphatic. Health and disease, exercise and inaction, nutrition and starvation, have also great influence in modifying both the power of the cerebral organs and their readiness to act. Moreover, when certain faculties have been much exercised for a series of generations in a family, they are apt to be manifested in greater strength and activity than where no such hereditary influence exists. Seeing that all the organs tend to action, each, if uncontrolled, must have a legitimate sphere of action, and be necessary for the welfare of man.

The Phrenologists and Nervousness cannot be called into action by the will. We cannot fear, or pity, or love, or be angry, by willing it. Two internal causes may stimulate the organs, and then, whether we will or not, their emotions will be felt. Again, these feelings are called into action in spite of the will, by the presentation of their external objects—Dangerousness, by objects of terror; Love, by beauty; and so on. The controllability of the feelings, whether stimulated from within or without, is increased by activity of the temperament. Insanity is a frequent result of over-activity of the propensities and sentiments. These may be discussed and yet the intellect sound. The converse is also true. When an organ is small, its being cannot be adequately experienced. The will can indirectly excite the propensities and sentiments by setting the intellect to work to find externally, or connect internally, the proper objects. Lastly, these faculties do not form ideas, but simply feel; and therefore have no memory, conception, or imagination.

The *Perceptive and Retentive Faculties*, of Identity, form ideas, perceive relations, and are subject to, or rather constitute, the Will; and minister to the affective faculties. They may be excited by external objects and by internal causes. When excited by the presentation of external objects, these objects are perceived, and this act is called *Perception*. It is the lowest degree of activity of the intellectual faculties, and those who are deficient in a faculty cannot perceive its object.

—*Conception* also is a mode of action of the faculties, not a faculty itself. It is the activity of the faculties from internal causes, either willed, or involuntary from natural activity.—*Imagination* is Conception carried to a high pitch of vividness.—*Memory*, too, is not a faculty, but a mode of action. There is no such thing as the *general memory* of the metaphysicians, but every intellectual faculty has its own memory. Memory differs from Conception and Imagination in this, that it recollects real objects or events which it has actually perceived, and adds the consciousness of their elapsed since they were perceived. The other named modes of action do not require realities or time.

—*Judgment* is properly, the perception of adaptation, fitness, and necessary consequence; this is a mode of action of the reasoning powers. In a certain sense, the Perceptive Faculties may each be said to possess judgment; as Colouring judges of colours; Form, of forms; Tune, of music. By the word 'judgment,' however, is meant right reasoning, sound deciding. To this, a proper balance of the affective faculties is essential. There can be no sound judgment where any of the feelings are

excessive.—CONSCIOUSNESS is the knowledge which the mind has of its own existence and operations.—ATTENTION is not a faculty, but the application, or tension, of any or all of the intellectual faculties.—ASSOCIATION is the succession of ideas in the mind, each seeming to call up that which succeeds; so that in our waking-hours the mind is never without an idea passing through it. This is a state or condition of the faculties, not a faculty.—PASSION is any faculty in excess: Love is the passion of Amativeness in union with Adhesiveness and Veneration; Avarice, of Acquisitiveness; Rage, of Destructiveness.—PLEASURE and PAIN, JOY and GRIEF, also belong to each faculty, according as it is agreeably or disagreeably affected.—HABIT is the power of doing anything well, acquired by frequently doing it. But before it can be done at all, there must be the faculty to do it, however awkwardly.—TASTE was held by Mr Stewart to be a faculty, and to be acquired by habit. It seems to be the result of a harmonious action of all the faculties.

Such is an outline of the system propounded by the phrenologists. So far as it shall be confirmed by the mature experience and observation of competent inquirers, the facts and principles which it unfolds must be of great practical value to mankind. The study of the mutual influence of the mind and body has ever been recognised by wise and observant men as one of high importance, though of great difficulty; and certainly, Gall and his followers have not only given a strong impulse to that study, but have thrown much light on the diversities of human character, and accumulated a large body of facts of a kind which had previously been too much overlooked. Much, it is admitted, still remains to be discovered. 'No phrenologist,' says Mr Combe, 'pretends that Gall's discoveries are perfect; they are far from it, even as augmented and elucidated by his followers; but I am humbly of opinion that, in their great outlines, his doctrines are correct representations of natural facts.' . . . The future of phrenology will probably exhibit a slow and gradual progress of the opinion that it is true and important; and only after this stage shall have been passed, will it be seriously studied as science. Hitherto this has not been done: the number of those who have bestowed on it such an extent of accurate and varied observation and earnest reflection as is indispensable to acquiring a scientific knowledge of chemistry, anatomy, natural philosophy, or any other science, is extremely small; and the real knowledge of it, on the part of such as continue, through the press and in public lectures, to oppose it, appears to me scarcely greater than it was in 1815 and 1826,' when it was ridiculed in the *Edinburgh Review*.

In considering the claims of phrenology, two questions should not be confounded. One is—How far the functions of the different parts of the brain have been established by observation of extreme instances of their large and small development?—the other, To what extent the facts so ascertained can be applied physiognomically in practice? Gall disclaimed the ability to distinguish either ill-defined modifications of forms of the skull, or the slighter shades of human character (*Sur les Fonctions du Cerveau*, iii. 41); nor, we believe, did he or Spurzheim ever pretend to estimate the size of every organ in a single brain. By attempting too much in these directions some of their disciples may have helped to prolong the incredulity with which phrenology is still widely regarded.

For the titles of numerous books on phrenology, see GALL (F. J.), SPURZHEIM (J. G.), and COMBE (G.); also an article in *The British and Foreign*

Medical Review, vol. ix. p. 190. Among the more recent works bearing on, or criticising phrenology, we may mention Dr Laycock's *Mind and Brain, or the Correlation of Consciousness and Organisation* (2 vols. Edin. 1860); his article on Phrenology in the 8th ed. of the *Encyc. Brit.*; an article on Phrenological Ethics in the *Edinburgh Review* for January 1842, vol. lxxiv. p. 376; Aug. Comte's *Philosophie Positive*, tom. iii. (or Miss Martineau's transl. i. 466); Sir Benj. C. Brodie's *Psychological Inquiries*, Dialogue vi. (Lond. 1854); G. H. Lewes's *Brief Hist. of Philos.*, p. 629 (Lond. 1857); Samuel Bayley's *Letters on the Philosophy of the Human Mind*, 2d Series, Letters xvi.—xxi. (Lond. 1858); and Professor Bain *On the Study of Character, including an Estimate of Phrenology* (Lond. 1861). Sir William Hamilton's objections, mostly published many years since, and which are now appended to his *Lectures on Metaphysics*, i. 404 (Edin. 1859), were discussed in the *Phren. Jour.*, vols. iv. and v., and are remarked on by Mr Combe in his work *On the Relation between Science and Religion*, pref., p. xvii. (Edin. 1857).

PHRYGANEÆ. See CADDICE.

PHRYGIA, a country in Asia Minor, the extent and boundaries of which varied very much at different periods of ancient history. In pre-historic ages it is believed to have comprised the greater part of the peninsula, but at the time of the Persian invasion it was limited to the districts known as Lesser Phrygia and Greater Phrygia—the former stretching from the Hellespont to Træs (inclusive), the latter occupying a central portion of Asia Minor. The inland boundaries of Lesser Phrygia are not well ascertained; but Greater Phrygia was bounded on the N. by Bithynia and Paphlagonia, on the E. by Cappadocia and Lycaonia, on the S. by the Taurus range, and on the W. by the maritime countries of Mysia, Lydia, and Caria. At a later period it was considerably reduced by the formation of Galatia (q. v.) and the extension of Lycaonia. P. was in general a high and somewhat barren plateau, though its pastures supported immense flocks of sheep, noted for the fineness of their wool, as indeed they still are. The most fertile part was the valley of the Sangarius, but the most beautiful and populous district was the southwest, at the base of the Taurus, where the Meander and other streams had their rise. The mountains and streams yielded gold; Phrygian marble was anciently celebrated, and the cultivation of the vine appears to have been extensively carried on.

The origin of the Phrygians is one of the mysteries of ancient ethnology. Some think that they were settled at a very remote period in Europe, and that they emigrated from Thrace into Asia Minor; and Xanthus, Herodotus, and Strabo certainly speak of such a migration. Xanthus places it after the Trojan war; but if there be any truth in the tradition at all, it can only refer to a return of some tribes to the cradle of the race in the valley of the Sangarius, for the Phrygians were regarded as one of the oldest races (if not the very oldest) in Asia Minor. Instead of seeking for their origin in Thrace, the best classical ethnologists seek for it in the neighbouring highlands of Armenia, whence the Phrygians are believed to have spread at a period far before the dawn of authentic history over the greater part of the Peninsula, and thence to have crossed into Europe, and occupied the greater part of Thrace, Macedonia, and Illyria; while the mythic Pelopis, who colonised the Peloponnesus, and gave it his name, was said by tradition to be a Phrygian. In both Greek and Latin poetry the Trojans are also called Phrygians, and the same name is applied to other nations of Asia Minor, such as the Mydonians and

MYRENE. In Throes, too, many of the names of places were the same as in Throes, while it has now been demonstrated that the Armenians, Phrygians, and Greek languages are able to each other, so that the people speaking the two former tongues, like those speaking the latter, belong to the great Aryan family of the human family. The Phrygians began to decline in power and numbers after the Trojan war. They were not so well made anything like the Romans but out of the mythic narratives of that early time—pushed out of Europe by the Hystians in the north and the Macedonians in the south, while in Asia Minor the rise of the Semitic Assyrians also depressed and weakened them, by breaking up the integrity of their territory. The whole of the south-east of the peninsula was occupied by Semitic invaders, the Lydians and Cappadocians were of Syro-Persian origin, and Media speaks of structures of Media as far north as Pontus. Their language, manners, and religion even underwent radical changes—have the Greek difficulty again, and in ascertaining their original characteristics. After being subdued by the Romans they passed, on the dissolution of the Lydian monarchy, under the sway of Greece; and it is only from this date that they are brought within the pale of positive history. Their country formed part of the empire of Alexander, and subsequently belonged to the Syrian Seleucids, to the kings of Pergamon, and to the Romans, who obtained possession of it, 133 B.C.

The Phrygians had not a warlike reputation among the ancients, but though in later times commonly described as indolent and slothful, yet, like the Greeks, they were of a mystic and exalted disposition. Their religious songs, accompanied by citharism and dancing, are frequently mentioned by classical writers, and appear to have exercised a very material influence on Hellenic worship. Orpheus, 'the great mother of the gods,' was the chief Phrygian deity; others were Sabazius (Dionysus), Olympus, Hyagnis, Lityrsus, and Maryas.

PHYRYNIA, one of the most celebrated courtesans of antiquity, was the daughter of Epicles, and was born at Thessalon in Bœotia. Her position in life was originally very humble, and she is said to have at one time earned a livelihood by gathering snails; but as the time of her marvellous beauty spread, she obtained numerous lovers, who lavished gifts on her so profusely that she became enormously rich. In proof of this, the story goes that she offered to rebuild the walls of Thebes, if the citizens would allow her to place this inscription on them: 'Alexander destroyed them; Phryne, the woman, rebuilt them.' The Thebans declined the proposal. Her enemies accused her of profaning the Eleusinian mysteries. Summoned before the tribunal of the Helots, she was defended by the rhetorician Hypereides, one of her lovers, who, perceiving that his eloquence failed to convince the judges, threw back her veil, and displayed her naked shoulders and bosom. She was immediately acquitted and carried in triumph to the Temple of Venus. The famous picture of Apelles (q. v.)—the 'Venus Anadyomene'—is said to have been a representation of P. Phryne, also a lover of her, employed her as a model for his 'Cupid and Psyche.'

PITHUIS. See *CINNAMOMUM*.

POOLWANA TREE. See *DALIA*.

PHYLAERY (from *Gr.* *phylon*, to guard), an aspidiot or scale worn by the Greeks against Asiatic infection. Certain strips of parchment, smeared with certain passages from the Scriptures (Isaiah vii. 1-10, 11-16; Deuteronomy vi. 4, 5, vi. 15-21), enclosed in small cases, and fastened

to the forehead and the left arm (*Phylak-*—also, in another form, to two wrists (*Amesset*)—as we with the Jews, in magical accordance with Exodus xiii. 9-16, &c., are also called in the New Testament phylacteries. The wearing of these is in the hands of privileged scribes (*Scribes*) only, and many and various are the superstitions which they have to follow in the execution of this task. Only vellum of a very superior kind is to be used; the characters must be traced with the greatest care; no erasures or corrections are allowed; the lines and letters must be of equal length, &c. The case in which they are enclosed consists of several layers of vellum or parchment. It may be observed, by the way, that not the wearing, but the exaggerated form of the phylacteries worn by some of the Pharisees, is inveighed against by Christ.

PHYLLOROMA. See *DECAPODOROMA*.

PHYSALIA, a genus of *Amphibia*, having an oval or oblong body, which consists in great part of an air sac, so that the creature floats on the surface of the sea, with numerous appendages of various kinds hanging from its under side. The shorter of these appendages are suckers, which are kept in constant motion for procuring prey, and which seem also to be employed in extracting nutriment from it, as the P. has no proper mouth nor alimentary canal. Among these shorter appendages, also, some seem to be devoted to the purpose of reproduction by germination. The longer appendages, which are extremely long—those of a P. five or six inches in length, being capable of extension to twelve or eighteen feet—the rope-like tentacles, possessing a remarkable stinging power, which is probably used for securing prey. It is a common trick with sailors to make a novice pick up a P., the beautiful colours of which always attract attention. The stinging power is, however, such as not merely to produce local pain, but constitutional irritation. It was at one time supposed that the P. has the power of expelling air from its bladder, and sinking at pleasure in the sea; but the observations of Mr Bennett (*Illustrations of a Naturalist in Australia*) render it more probable that it always floats on the surface, and is driven about by the winds. The name *Portuguese Man-of-War* (*Physalia physalis*)

Portuguese Man-of-War (*Physalia physalis*)

It is a common trick with sailors to make a novice pick up a P., the beautiful colours of which always attract attention. The stinging power is, however, such as not merely to produce local pain, but constitutional irritation. It was at one time supposed that the P. has the power of expelling air from its bladder, and sinking at pleasure in the sea; but the observations of Mr Bennett (*Illustrations of a Naturalist in Australia*) render it more probable that it always floats on the surface, and is driven about by the winds. The name *Portuguese Man-of-War* is often popularly given to the species of P., and particularly to *P. physalis*. The *Physalia* are inhabitants of the sea of warm latitudes, but shoals of them are occasionally driven to the British coasts.

PHYSALIS, a genus of plants of the natural order Solanaceæ, remarkable for the calyx, which becomes large and inflated after flowering is over, and encloses the ripened berry. The species are annual and perennial herbaceous plants and shrubs, natives of temperate and warm climates, and widely scattered over the world. The Common Withers Creeper (*P. alboburgata*) is a perennial, native of the south of Europe and great part of Asia, growing in vineyards and bushy places. It is not a native of

Britain, but is pretty frequent in flower-gardens. It has ovate triangular downy leaves, dirty-white flowers; and the fruit when ripe is a shining red berry, enclosed in a very large vermilion-coloured bladder. The berries have a sweetish subacid taste; they are seldom eaten in Britain, but very generally

Love Apple (*Physalis edulis*).

in many parts of the continent of Europe. They are refrigerant and diuretic, and were formerly employed in medicine on account of these properties.—The DOWNY WINTER CHERRY, or PERUVIAN GOOSEBERRY (*P. pubescens* or *P. Peruviana*), is an annual American species, densely clothed with down; with heart-shaped leaves, yellow flowers, and yellowish berries which are eatable, and when preserved with sugar, make an excellent sweetmeat. It is cultivated and naturalised in many of the warmer parts of the world, and sometimes ripens its fruit in England, and even in Scotland.—Some of the other species of *P.* are among the most common weeds of the West Indies and tropical America; and the fruits of some of them are occasionally eaten, although not esteemed.

PHYSETER. See CACHOLOIT.

PHYSIC NUT (*Curcas*), a genus of plants of the natural order *Euphorbiaceæ*, having a 5-partite calyx, 5 petals, and 8–10 unequal-joined stamens. The species are not numerous. They are tropical shrubs or trees, having alternate, stalked, angled or lobed leaves, and corymbs of flowers on long stalks; and notable for the acrid oil of their seeds. The COMMON P. N. of the East Indies (*C. purgans*), now also common in the West Indies and other warm parts of the world, is a small tree or bush, with a milky juice. It is used for fences in many tropical countries, and serves the purpose well, being much branched and of rapid growth. The seeds are not unpleasant to the taste, but abound in a very acrid fixed oil, which makes them powerfully emetic and purgative, or in large doses poisonous. Instances have recently occurred of very alarming, although not fatal, results from the eating of the seeds, imported into Britain under the name of *Physic Nuts*, *Jatropha Nuts* or *Jatropha Seeds* (the Linnean name of the plant being *Jatropha purgans*), and *Barbadoes Nuts* or *Barbadoes Seeds*. The expressed oil, commonly called *Jatropha Oil*, is used in medicine like croton oil, although less powerful; it is also used in lamps. The milky juice of the shrub is used by the Chinese for making a black

varnish, in order to which it is boiled with oxide of iron.—The FRENCH P. N., or SPANISH P. N. (*C. multifidus*), a shrub, native of the tropical parts of America, with many-lobed leaves, yields a purgative acrid oil, called *Oil of Pinhoen*. It is very similar in its qualities to the oil obtained from the former species, perhaps stronger. To this genus belongs the PINONCILLO (*C. lobatus*) of Peru, the seed of which is eaten when roasted, and has an agreeable flavour, although when raw it is a violent purgative. When an incision is made in the stem of this tree, a clear bright liquid flows out, which after some time becomes black and horny. It is a very powerful caustic, and retains this property for years.

PHYSICAL GEOGRAPHY. See GEOGRAPHY.

PHYSICIANS, THE ROYAL COLLEGE OF (of London), was founded in 1518 by the munificence of Thomas Linacre, a priest and distinguished physician, who was born in 1460, and died in 1524. In 1518, through the influence of Cardinal Wolsey, he obtained from Henry VIII. letters-patent granting to John Chambre, himself, and Ferdinandus de Victoria, the acknowledged physicians to the king, together with Nicholas Halsewell, John Francis, Robert Yaxley, and all other men of the same faculty in London, to be incorporated as one body and perpetual community or college. They were permitted to hold assemblies, and to make statutes and ordinances for the government and correction of the College, and of all who exercised the same faculty in London and within seven miles thereof, with an interdiction from practice to any individual unless previously licensed by the President and College. Linacre was the first president, and held the office till his death in 1524. The meetings of the College were held at his house in Knight-rider Street, which he bequeathed to the College, and which, until the year 1860, continued in the possession of that body. About the time of the accession of Charles I., the College, requiring more accommodation, took a house at the bottom of Amen Corner, which was subsequently purchased by Dr Harvey, and in 1649 was given by him to his colleagues. This was the seat of the College till 1666, when it was destroyed by the great fire of London. A new College was then built in Warwick Lane, and opened in 1674 under the presidency of Harvey's friend, Sir George Ent; and here the meetings were held till 1825, when the present edifice in Pall-Mall East was opened under the presidency of Sir Henry Hallford.

The reason for forming the incorporation, as set forth in the original charter, is 'to check men who profess physic rather from avarice than in good faith, to the damage of credulous people;' and the king (following the example of other nations) founds 'a college of the learned men who practise physic in London and within seven miles, in the hope that the ignorant and rash practisers be restrained or punished.' The charter further declares, that 'no one shall exercise the faculty of physic in the said city, or within seven miles, without the College licence, under a penalty of £5;' that, in addition to the president, 'four censors be elected annually to have correction of physicians in London and seven miles' circuit, and of their medicines, and to punish by fine and imprisonment;' and that 'the President and College be exempt from serving on juries.' Four years later, in 1522–1523, an act was passed confirming the charter, and enacting that 'the six persons before said named as principals and first-named of the said commonalty and fellowship, shall choose to them two men of the said commonalty from henceforward to be called and cleaped Elects, and that the same elects yearly choose one of them to be president of the said commonalty;' and

lumber directing that, in case of a vacancy by death or otherwise, the surviving elects 'shall choose, name, and admit one or two, as need shall require, of the most cunning and expert men, of and in the said locality in London;' and that 'no person from henceforth be suffered to exercise or practice in physic, except he be a graduate of Oxford or Cambridge until such time as he be examined at London by the said president and three of the said elects, and have from them letters testimonial of their approving and examination.'

In 1540 an act was passed (32 Hen. VIII. c. 40) by which the President and College were exempted, in consequence of their professional duties, 'from keeping watch and ward, and from being obliged to the office of constable and other offices,' and the officers were authorized 'to enter apothecaries' houses, to search yere, and see their wares, drugs, and stuffs, and to cause to be burnt, or otherwise destroyed, such as they find defective, corrupted, and not meet nor convenient to be ministered in any medicine for the health of man's body.' In this act it was further declared explicitly that 'surgery is a part of physic, and may be practised by any of the company or fellowship of physicians'—a doctrine which in later times has been totally repudiated by the collegiate body, who, until a few years ago, would not stoop to their privilege as members of the Royal College of Surgeons, unless he formally resigned his surgical diploma (for which act of resignation the College of Surgeons charged him a fee of £5). Other Acts touching the Corporation of the Physicians, London, were passed in 1555, 1614, and 1659 (the last being known as 'the Medical Act'), which require no special notice, except that the Medical Act provides for the granting of a new charter to the College, which was obtained in 1862. Finally, in 1860, 'an Act to Amend the provisions of the act of Henry VIII. (1522—1523) as to the elects on the ground that their main function was licensing country physicians (the class recognised as *Licentiatum extra urbem*), and that it has virtually ceased; and declares that 'the office and name of elects of the said College shall henceforth wholly cease,' and that the Presidency shall in future be an annual office, open to the Fellows at large, who shall also be the electing body.

The College has consisted, till the last few years, of *Fellows* (amongst whom were the eight Elects), who are a self-electing body, and were, until about 25 years ago, almost invariably graduates of Oxford or Cambridge; *Licentiates*, who were examined by the president and officers, and who alone, excepting the Fellows, had the privilege of practising in and within seven miles of London; and *Extra-licentiates*, who were examined by the Elects, and had the privilege of practising in any part of England excepting in and within seven miles of London. As at present constituted, it consists of Fellows, Members, Licentiates, and Extra-licentiates. The Fellows are elected from members of at least four years' standing, who have distinguished themselves in the practice of medicine, or in the pursuit of medical or general scientific literature. The government of the College is vested in the President and Fellows only. The present Member consist of persons who had been admitted before February 1859 licentiates of the College, or extra-licentiates who have complied with certain conditions; and of persons who have attained the age of 25 years, who do not dispense or supply medicine, and who, after being duly proposed, have satisfied the College 'touching their knowledge of medical and general science and literature,' and that they have 'been engaged in the study of physic during a period of five years, of which

four years at least shall have been passed at a medical school recognised by the College.' The members constitute a portion of the corporation, in so far as they have the use of the library and museum, and the privilege of admission to all lectures; but they do not take any share in the government or attend or vote at meetings. The *Licentiates* are not members of the corporation, and in their qualifications very much resemble those who have diplomas both from the College of Physicians and the Apothecaries' Hall. They must be 21 years of age, and must have been engaged in professional studies for five years before being admitted to examination.

The fee for admission as a Fellow is 50 guineas, exclusive of stamp-duty; the fee for admission as a Member is 20 guineas; and the fee for the license to practise physic as a Licentiate of the College is 10 guineas.

The following by-laws of the College should be generally known: 1. No Fellow of the College is entitled to sue for professional aid rendered by him. This by-law does not extend to Members. 2. No Fellow, Member, or Licentiate of the College is entitled to assume the title of Doctor of Medicine unless he be a graduate in medicine of a university. 3. No Fellow or Member of the College shall officiously, or under colour of a benevolent purpose, offer medical aid to, or prescribe for, any patient whom he knows to be under the care of another legally qualified medical practitioner.

PHYSICS, or PHYSICAL SCIENCE (Gr. *phusis*, for, natural), comprehends in its widest sense all that is classed under the various branches of mixed or applied mathematics, natural philosophy, chemistry, and natural history, which branches include the whole of our knowledge regarding the material universe. In its narrower sense, it is equivalent to Natural Philosophy (q.v.), which, until of late years, was the term more commonly used in Great Britain, and denoted all knowledge of the properties of bodies as bodies, or the science of phenomena unaccompanied by essential change in the subjects; while chemistry is concerned with the composition of bodies, and the phenomena unaccompanied by essential change in the subjects; and natural history, in its widest sense, includes all the phenomena of the animal, vegetable, and mineral world. The application of the term *Physic* to a branch of the last—viz. the science of medicine—is peculiar to the English language.

PHYSIOGNOMY (Gr.), the art of judging of the character from the external appearance, especially from the countenance. The art is founded upon the belief, which has long and generally prevailed, that there is an intimate connection between the features and expression of the face and the qualities and habits of the mind; and every man is conscious of instinctively drawing conclusions in this way for himself with more or less confidence, and of acting upon them to a certain extent in the affairs of life. Yet the attempt to reach this conclusion by the application of certain rules, and thus to raise the art of reading the human countenance to the dignity of a science, although often made, has never yet been very successful. Comparisons have been instituted for this purpose between the physiognomies of human beings and of species of animals noted for the possession of peculiar qualities, as the wolf, the fox, &c. This was first begun by Della Porta, a Neapolitan, who died in 1615, and was afterwards carried further by Tschelwein. The subject of physiognomy was eagerly prosecuted by Thomas Campanella, and when his labours had nearly been forgotten, attention was

again strongly attracted to it, although only for a short time, by the writings of Lavater (q. v.).

PHYSIOLOGY (Gr. *physis*, nature; *logos*, a discourse) is the science which treats of the phenomena which normally present themselves in living beings, of the laws or principles to which they are subject, and of the causes to which they are attributable. It is, in short, the *science of life*, and hence the term *Biology* (Gr. *bios*, life) has been adopted by some writers in place of physiology. Biology is, however, regarded by some authors (and, we think, correctly) as including in its scope more than physiology, as will be seen from the following extract from Professor Greene's remarks 'On the Principles of Zoology': 'Biology,' he observes, 'is that branch of scientific inquiry which undertakes to investigate the nature and relations of living bodies. Every living being may be regarded from two points of view, which it is necessary to distinguish clearly from one another. The first of these exhibits to us living beings as possessing definite forms, which, in most instances, are found to be made up of a number of dissimilar parts or *organs*; while the second takes cognizance of the vital actions or *functions* which these organs perform. That department of biology which determines the former is termed *Morphology*; that which investigates the latter, *Physiology*. Hence the nature of living beings is twofold—*morphological* and *physiological*.'—*A Manual of the Protozoa*, 1859, pp. ix—x.

PHYTOLACCA, a genus of exogenous plants, of the natural order *Phytolaccaceæ*. This order contains about 70 known species, half-shrubby and herbaceous plants, natives of warm parts of Asia, Africa, and America, and is nearly allied to the order *Chenopodiaceæ*, from which it is distinguished by the frequently numerous carpels, the corolla-like perianth when the carpel is single, and the stamens either exceeding the number of the segments of the perianth, or alternate with them. It is also nearly allied to *Polygonææ*. The genus *Phytolacca* has for its fruit a berry with 8–10 cells, each cell one-seeded. *P. decandra*, the Poke or Poca, a native of North America, now naturalised in some parts of the south of Europe, is sometimes cultivated for its young shoots, which, when blanched, are eaten like asparagus. Yet the leaves are acrid, and the root is an emetic almost or altogether equal to ipecacuanha. The root is also externally applied to cure itch and ringworm. A tincture of the ripe berries, which are fully larger than Black Currants, and grow in racemes, is efficacious in chronic rheumatism and syphilitic pains. By some it is held to be more valuable than guaiacum. The pulp of the berries is employed in the adulteration of wine.—The young shoots of *P. acinosa* are boiled and eaten in the Himalayas, those of *P. octandra* in Cayenne, and a Chinese species has recently been introduced into British gardens for the same use under the name of *P. esculenta*.

PHYTOLOGY, another name for Botany, not much in use.

PHYTOZOÏA (Gr. *phyton*, a plant; *zōon*, an animal), also called *Antherozoids*, are minute bodies produced amidst a mucilaginous fluid in the antheridia of many cryptogamous plants (Algae, Hepaticæ, Mosses, Ferns), which are either aquatic or delight in moist situations. In some many-celled antheridia of the higher cryptogamous plants, each cell is devoted to the production of a single phytozoon. When the antheridium is mature, and bursts, the phytozoa move for a short time by means of cilia—a provision, apparently, for their reaching the pistillidia, the spores contained in which—according

to an opinion rapidly gaining ground among botanists—they are destined to fertilise. Great diversities exist in the phytozoa of different cryptogamous plants. The annexed figure will convey a better notion of them than any mere description.

Phytozoa:

(From Carpenter on the Microscope.)

- A. Antherozoids of *Fucus platycarpus* (a sea-weed), some of them free, others still included in their antheridial cells.
- B. Cellular contents of an antheridium of *Polytrichum commune* (a moss), mature and discharging the antherozoids.
- C. Antherozoid of *Pteris serrulata* (a fern) showing a, its large extremity; b, its small extremity; c, d, its cilia.

Cryptogamous plants, which, as lichens, live in dry situations, have no phytozoa, although it is supposed that they have organs destined to the same purpose, but destitute of the power of motion by cilia.

PIACENZA, a city of Northern Italy, in the province of the same name, on the right bank of the Po, 2 miles below the confluence of the Trebbia with that river, and 36 miles west-north-west of the city of Parma. Beautifully situated on a fine plain, confined on the south by well-cultivated hills, the city itself is gloomy and desolate in appearance. Its streets are broad and regular—that called the *Stradone* is one of the most beautiful in Italy—but many of them are unfrequented and grass-grown. It contains numerous palaces, and about 50 churches. The cathedral, an edifice in the ancient Lombard style, founded in the 11th c., is famous for the richly-curious and grotesque character of its internal decorations, for its numerous sculptures, its paintings, and for a number of frescoes of great grandeur, by Caraccio, Guercino, and others. The Church of Sant' Antonio, the original cathedral of P., was founded in 324 A.D., but has been several times rebuilt. Among the other principal buildings, are the Palazzo Farnese, founded in 1553, and once a sumptuous edifice, but which has been long in use as a barracks; the Palazzo del Comune, and the Colle dei Mercanti are fine monuments of art. The principal square is the Piazza Cavalli, so called from the colossal bronze equestrian statues of the dukes Alessandro and Rannuccio Farnese. This town occupies by far the most important position in a military point of view, in Italy—a fact which was fully appreciated by those who fortified it with solid walls and a strong castle, which, till 1859, were guarded by the Austrians. On being forced from the city by the war of 1859, the Austrians did not destroy the works, and the Italian government has strengthened and extended them by the formation of externally defended works, and of a formidable entrenched camp, which unites and protects the other works on the right bank of the Po.

Manufacturers of silks, linings, laces, hats, &c. are carried on to some extent. Pop. (1862), which has considerably increased within the last ten years, 39,337.

P., ruled by the Romans *Placidia*, on account of its pleasing situation, first mentioned in 219 A.D., when a Roman colony was settled there. In 290 A.D. it was plundered and burned by the Goths, but rapidly recovered its prosperity, and was long an important military station. P. was the western terminus of the great Hadrian's road, which began at Acremonia on the Adriatic. In later history, it played an important part as one of the independent Lombard cities.

PIA MATER. See NASTUR MATHON.

PIA NIT (Ital. *nit*), abbreviated *p.* is used in music to denote that the strain where the indication occurs is to be played with less than the average intensity of force. *pp*, or *ppp*, for *pianissimo*, signifies very soft, or as soft as possible. In contradistinction from *piano*, *forte*, abbreviated *f*, is used to denote a more than usual force; and *ff*, or *fff*, for *fortissimo*, a still greater degree of force. The gradual transition from *piano* to *forte* is indicated by the sign *—fz*, from *forte* to *piano* by the sign *—fz*.

PIANOFORTE (Ital. *piano*, soft, and *forte*, loud), a stringed musical instrument, played by keys, developed out of the Clavichord and Harpsichord (see *v.*), from which the pianoforte differs essentially in the introduction of hammers to put the strings in vibration, connected with the keys by a mechanism that enables the player to modify at will the intensity of the sound; whence the name of the instrument.

The idea of the pianoforte was conceived independently about the same time by three persons in different parts of Europe—a German organist of the name of Salomon; Marinus, a French harpsichord-maker; and Bartolomeo Cristofori, a harpsichord-maker of Padua. The first point of invention (1714) is due to the Italian maker. Salomon's discovery was followed up in Germany by Silbermann of Stralburg, pupil of Marston, Stein of Augsburg, and others. The first pianoforte seen in England was made at Rome by Father Wood, an English monk there. A few German manufacturers and workmen settling in London, gave an impetus to the new instrument. The English pianoforte has been brought to its present state of perfection by a succession of improvements suggested at the hands of Broadwood, Stodart, Erard, Clementi, Callard, Wornum, Hopkinson, and other makers. All the really important later inventions are English. The compass of the early pianoforte was, like that of the harpsichord, four to five octaves, from which it has been gradually increased to 6½, or seven octaves, or occasionally more.

The most natural of the various terms which the instrument assumes is that of the grand pianoforte, derived from the harpsichord, with the strings placed horizontally, and parallel to the keys. The strings are stretched across a compound frame of wood and metal, composed of bars, ribs, and strengtheners of extreme kind—appliances necessary to resist the enormous tension. This framework includes a wooden sound-board. The mechanism by which hammers are connected with the keys, is called the action of the instrument. In the earliest pianofortes, the hammer was raised from below by a button attached to an upright wire fixed on the back-end of the key. The impulse given to the hammer caused it to strike the string, after which it immediately fell back on the button, leaving the string free to vibrate. This was called the *single action*. As the hammer, when resting on the button with the key pressed down, was then necessarily

at a little distance from the string, the effectual working of this action required that a certain impulse should be communicated to the hammer to enable it to touch the string. Hence it was impossible to play very piano, and it was found that if the hammer was adjusted so as to be too close to the string when resting on the button, it was apt not to leave the string till after the blow had been given, thereby deadening the sound. This defect was remedied by a jointed upright piece called the *hopper*, attached to the back-end of the key, in place of the wire and button. When the key was pressed down, the hopper, engaging in a notch in the lower side of the hammer, lifted it so close to the hammer, that the lightest possible pressure caused it to strike; and at this moment, when the key was still pressed down, the pointed part of the hopper, coming in contact with a fixed button as it rose, escaped from the notch, and let the hammer fall clear away from the string. To prevent the hammer from rebounding on the string, a projection called the *check* was fixed on the end of the key, which caught the edge of the hammer as it fell, and held it firmly enough to prevent it from rising. A necessary part of the action is the *damper*, which limits the duration of each particular note, so as in case it is ceased to sound as soon as the pressure is removed from the key. It consists of a piece of leather resting on the top of the string and connected with the back-part of the key by a vertical wire. When any key is pressed down, the damper is raised off the string, so as to allow the sound produced to be clear and open; but immediately on the finger being lifted off the key, the damper falls, and the damper again presses on the string, muffling and stopping the vibration. The whole range of dampers may, when required, be raised by the use of the damper pedal, so as to prolong the sound of one note into another.

One further frequent and important addition to the action may be alluded to. In the mechanism above described, the key must rise to its position of rest before the hopper will again engage in the notch of the hammer for another stroke; hence, a note cannot be repeated until time has been allowed for the full rise of the key. Two expedient actions is a contrivance, varying in different instruments, for getting rid of this defect, by holding up the hammer at a certain height while the key is returning.

Great difference of detail exists in the actions of different makers. Some are more complicated than others; but in all are to be found the same essential parts, only modified in shape and arrangement. The subjoined figure represents one of the simplest grand pianoforte actions now in use. A is the

key, B the lever which raises the hammer, C the hammer, D the string, and E the damper; F is the button which catches the lever after it has struck the hammer, G the check, H the damper pulley, I the spring, and K, K, K are rails and sockets.

Formerly, the strings of the pianoforte were all of thin wire; now, the bass-strings are very

thick, and coated with a fine coil of copper-wire; and the thickness, strength, and tension of the strings all diminish from the lower to the upper notes. A grand pianoforte has three strings to each of the upper and middle notes, and now, generally, only two to the lower notes, and one to the lowest octave. When the soft pedal is pressed down, the hammers are shifted sideways, so as to strike only two strings instead of three, or one string instead of two.

Besides the grand, the kinds of pianofortes in use are the square, in which the strings are placed still in a horizontal position, but obliquely to the keys; and the upright, in which the strings run vertically from top to bottom of the instrument. The difference in form necessitates alterations in the details of the action, but the general principle is the same.

The pianoforte has in modern times attained a widespread popularity beyond that of any other musical instrument. It possesses nearly all the powers of expression of any other instrument; on no other except the organ can we execute such complete successions of harmonies; no other represents the orchestra so well, with the advantage that the various parts adapted to it are brought out by the same performer. In all cities of the civilized world, there are numerous manufacturers of the pianoforte, employing multitudes of workmen; and even in the secondary towns of Europe, the number of makers is daily increasing. In England, the manufacturers who have for some time past enjoyed the highest repute are Messrs Broadwood, Collard & Co., and Erard; but other makers are rapidly approaching them in excellence. Till lately, the German makers adopted a much less perfect action than the English, producing a very different touch and tone; but they are now largely using the English action, which is spreading over the continent. Music for the pianoforte is written in two staves, and on the treble and bass-clefs. Many of the most eminent musicians have devoted themselves to composing for the pianoforte, and some composers of note, as Hummel, Czerny, Kalkbrenner, Chopin, Thalberg, Liszt, and Heller, have almost entirely confined themselves to that instrument. See Rimbault, *The Pianoforte, its Origin, Progress, and Construction* (Lond. 1860).

PIARISTS, called also familiarly *Scolopini*, or 'Brethren of the Pious Schools,' a religious congregation for the education of the poor, founded at Rome in the last year of the 16th century. The originator of this institute was a Spanish priest, named Joseph of Calasanza, who, while in Rome, was struck with the imperfect and insufficient character of the education which then prevailed, even for the children of the higher classes, and conceived the idea of organising a body for the purpose of meeting this want, which the Jesuit Society had already partially supplied. The school which he himself, in conjunction with a few friends, opened, rapidly increased in number to 100, and ultimately to 700 pupils; and in 1617, the brethren who, under the direction of Joseph, had associated themselves for the work, were approved as a religious congregation by Paul V. (q. v.), who entered warmly into this and all other projects of reformation. In 1621, Gregory XV. approved the congregation as a religious order. The constitution of the order was several times modified by successive popes, down to the time of Innocent XI. Its field of operations has, of course, been confined to European countries; and at present it can reckon communities in Italy, Austria, Spain, Hungary, and Poland. In Italy, during the revolutionary wars, the P. received into their ranks many members of the suppressed Society of the Jesuits. In Spain, their establishments were spared,

on the general suppression of religious orders in 1836. In Poland, eleven houses still were in existence in 1832. The number of members in Hungary is said to be about 400, and the order is also found in the other dependencies of Austria. See Wetser's *Kirchen-Lexicon*.

PIA'SSABA, or PIACABA, a remarkable vegetable fibre which, during the last twenty years, has become an article of much importance in this country. It is procured from Brazil, chiefly from the ports of Para and Maranhão, and is produced by one or more species of palm. That which furnishes the greater part is the Coquilla-nut Palm (*Attalea funifera*); but Mr Wallace states that much of it is procured from a species of *Leopoldinia*, which he has named *L. piassaba*. The fibre is produced by the stalks of the large fan-like leaves. When the leaves decay, the petioles or stalks split up into bundles of cylindrical fibres of a dark-brown colour, and of a hard texture, varying in thickness from that of a horse-hair up to that of a small crow-quill. This material has been found of great utility in making brushes of a coarse kind, particularly those required to sweep the street; and for this purpose they have almost superseded birch-brooms, split whale-bone brushes, and other similar means for scavengers' work. The coarsest fibres are best for such purposes, and the finer ones are found very valuable for finer kinds of brushes.

PIA'STRE (Gr. and Lat. *emplastron*, a plaster; transferred in the Romanic languages to anything spread out or flattened, a plate, a coin), a Spanish silver coin which has been extensively adopted by other nations. It was formerly divided into 8 silver reals, and hence was termed a *piece of eight*, which name was invariably applied to it by the Buccaneers of the Spanish Main. The present Spanish piastre, commonly known as the *peso duro*, *peso fuerte*, or, briefly, *duro*, is the standard of the money system, and is equivalent to about 4s. 3d. of our money. It is divided into 20 copper reals (*reales de vellon*). In the Levant, the piastre is called a *colonnato*, on account of the original coins, which were struck for use in Spanish America, bearing two columns on the reverse side.—The Italian piastre, or *scudo*, is an evident imitation of the Spanish coin, and is exactly equal to it in value.—The same is true of the piastres in use in Chili, Mexico, and South America, with the sole exception of New Granada, where it is about 2½d. sterling less. The Dollar (q. v.) of the United States of North America was adopted from the Spanish piastre, but is a fraction less in value, owing, it is said, to an error in the original estimate. The original Spanish 'pillar' piastres or dollars are current nearly all over the world.—The coin known as the Turkish piastre is not an imitation, but is an independent national silver coin, which, in 1753, was worth about 3s. 6d. sterling, but has since gradually and rapidly deteriorated, till at the present day it is equal to not more than 2½d. of our money.—The Egyptian piastre is worth about 2½d. sterling. Pieces of 2, 5, 10, and 20 piastres are struck in silver, and of 50 and 100 in gold; the piece of 100 piastres being in Egypt the exchange at par for £1 sterling.

PIA'ZZA, an open place or square. The name is also applied to a portico or arcade, such as often surrounds a piazza in warm countries.

PIAZZI, GIUSEPPE, a celebrated astronomer, was born at Ponte in the Valteline, July 16, 1746. He was received into the order of the Theatins at Milan in 1764; and studied in that city, and subsequently in the houses of the same order at Rome and Turin. Summoned to the professorial chair of Philosophy at Genoa, he so alarmed the Dominicans by the

freedom and boldness of his opinions, that his friend the great-master thought it desirable to remove him to Malta, where, in 1775, he became Professor of Mathematics in the newly-founded university. On the breaking up of this university, he returned to Italy, and after teaching philosophy in the Nether College of Palermo, he went to Rome, where he became Professor of Descriptive Geometry in the Institute of San Andrea della Valle. He was transferred in 1790 to the chair of Mathematics in Palermo, and after some time, obtained the consent and aid of government to establish an observatory at Palermo, which was not in working order in 1793. The first results of his observations were the rectification of some errors in the estimation of the obliquity of the ecliptic, the aberration of light, the length of the tropical year, and the parallax of various heavenly bodies; these results were published in 1793. P. had now attained a European reputation, which was further heightened by his discovery, on the night of 1st January 1801, of a new planet, the first known of the great group of planets between Mars and Jupiter. P. was only able to give a description of it, accompanied with some hypotheses of his own, to some of the German and Italian astronomers, whom it disappointed; Gauss (p. v.), however, rendered certain the fact of its being a planet. It received from P. the name Ceres, after the ancient goddess of Sicily. P. was so strongly attached to Sicily, which he regarded as it were his native country, that all the splendid offers of Napoleon were insufficient to induce him to remove to Bologna. In 1802, he published a map of the fixed stars, far superior to any before published, the result of ten years' observations; this work was crowned by the Institute of France. In 1814, appeared a new and more complete catalogue (comprising 7045 stars), for which he was again rewarded with a prize from the French Académie. He also gave researches into the nature of comets, aimed to regulate the weights and measures of Sicily, and devoted the later years of his life to the improvement of public education in Sicily. He wrote a number of works, of which, besides the two catalogues of stars above mentioned, the *Lezioni Elementari di Astronomia* (Palermo, 1817) is the chief. He is also the author of many memoirs drawn up for the various scientific societies of Europe. P. died, 2nd July 1820, at Naples.

PIPHROCH, a species of martial music performed on the bagpipe of the Highlanders, which has been found to have a wonderful power in arousing their military instincts. Its rhythm is so irregular, and its notes in the quicker parts so much jumbled together, that a stranger has difficulty in following the modulation or recalling his ear to them. The earliest mention of the military music of the bagpipe is in 1598, at the battle of Balinacree; indeed, prior to that period, the bagpipe was hardly in use as a national instrument of Scotland. There are appropriate phrases belonging to various clans and districts, but some of these may not be older than the beginning of last century. One of the oldest known phrases is called the 'Battle of Harlaw,' but it may be doubted whether it was contemporary with that event (1411). In the ballad account of that battle, there is mention of trumpets and horns, but none of the bagpipe; and the phreth style of music that we observe a relation to the bagpipe, that it is difficult to suppose that it preceded the use of that instrument. According to Mr Walter Scott, the resemblance in appearance affords to discover in a well-composed phreth the imitative sounds of march, conflict, flight, pursuit, and all the current of a battle field. Many remarkable instances have been recorded of the effect of the phreth on the

Highlanders. At the battle of Culloden, in April 1746, whilst the British troops were retreating in confusion, the pipes were ordered to strike up a favourite phreth, and the result was that the Highlanders, who were broken, rallied the moment that they heard the music and formed with great slowness in the rear.

PICARDY (Picardie), an ancient province in the north of France, was bounded on the W. by the English Channel, and on the E. by Champagne. The name does not occur till the 13th century. The capital of this province was Amiens. The territory now forms the department of Somme and portions of the departments of Aisne and Pas-de-Calais.

PICCOLO (Ital. *piccolo piccolo*, small flute), a flute of small dimensions, having the same compass as the ordinary flute, while the notes all sound an octave higher than their relation. In plays as well as violent passages, this instrument is sometimes very effective in an orchestra.

PICCOLOMINI, one of the oldest and most distinguished families of Italy, was originally settled at Rome, but afterwards removed to Siena, and subsequently obtained possession of the Duchy of Analf. It has produced numerous celebrated *literateurs* and warriors, one pope (Pius II.), and several cardinals. One of the most distinguished in the history of this family was Ottavio P., the first Duke of Analf, born in 1559, and fifth in direct descent from Pope Pius II. He early entered the Spanish military service, and after taking part in the Milanese campaign, was sent as captain with a Florentine cavalry regiment to aid Ferdinand II. against the Bohemians. As a cavalry leader, he distinguished himself; and from the regiment of cuirassiers under his command issued the death-dealing bullet to Gustavus Adolphus. In 1624, he was placed under the orders of Wallenstein, who took a great fancy to him, and wished to turn his sword designs against the emperor; P., however, communicated these designs to the emperor, and received, as a reward for his fidelity, a park of Wallenstein's estates. During the remainder of this year, he was actively engaged against the Swedes, and greatly distinguished himself in the first battle of Nordlingen. In the following season he was sent with 30,000 troops to aid the Spaniards in the Netherlands, where the French and Dutch were carrying all before them. P. equally drove on the French, but his success against the Dutch was not so marked. He was withdrawn by the emperor in 1640 to stay the Swedes, who, under Baner, were threatening the hereditary possessions of Austria, and his success against these invaders in Babemia and the Palatinate, though damped by the defeat inflicted on him in Silesia by Tormasohn, induced the king of Spain to entreat the emperor to send him again to the Netherlands to take the command of the Spanish troops. But his success was not nearly so decisive as before, the province of the Spanish infantry having been completely destroyed by the great Conde at Rocroi (19th May 1643). P., however, was again successful against both the French and Dutch till 1648, when he was again summoned to Germany to encounter the victorious Swedes; but after a brief campaign, the peace of Westphalia (1648) put an end to his career. He was created a *hollonist* by the emperor, and was sent as plenipotentiary to the Congress of Nuremberg (1649), and soon after was raised to the

high dignity of a prince of the empire. The king of Spain conferred upon him the order of the Golden Fleece, and bestowed upon him in fief the duchy of Amalfi, which had previously belonged to his family. P. died at Vienna, 11th August 1656, leaving no children; his son Max, who figures in Schiller's *Wallenstein*, is only a poetical fiction. His fame as a warrior and general is somewhat tarnished by his cruel treatment of a number of Hessian and Luneburger prisoners in 1640.

PICHEGRU, CHARLES, a French general, was born 16th February 1761, at Arbois, in the department of Jura, France. Though of humble parentage he succeeded in gaining admission to the college of his native town, where, and subsequently at Brienne, he received a thorough education. He was specially distinguished in mathematics, and had some thoughts of devoting himself to teaching as a profession; but the advice of Father Perault induced him to enter an artillery regiment in 1783, and he had risen to the rank of a lieutenant when the Revolution broke out. P. became an ardent democrat; joined the army of the Rhine, and by his brilliant soldierly qualities soon attracted general attention. In 1793, he became commander-in-chief of the army, and in conjunction with the army of the Moselle under Hoche, repeatedly defeated the Austrians, took from them many important towns, as Gemersheim, Spire, Worms, &c., and established himself in the Palatinate; while, after the arrest of his coadjutor Hoche, his success at the head of the combined Rhine and Moselle armies was not less decided. The rapidity and boldness of his manoeuvres, when he took the command of the army of the north, in 1794, disconcerted the allies; and before long they were compelled to retreat beyond the Meuse. After a brief respite, P. crossed this river, driving the British before him; and by February 1795, had completed the conquest of the Dutch towns and provinces, ending the campaign by capturing the enemy's fleet (which had been frozen in). He next visited Paris, and while there, suppressed an insurrection of the faubourgs (1st April 1795); but soon afterwards returned to the army, which was now opposed to the Austrians on the western frontier, and for some time displayed his usual skill and energy, crossing the Rhine in the face of the enemy, and capturing Mannheim, the chief fortress, on its banks. But the anarchy which he had found at Paris, combined with the flattering promises and bribes held out to him by the Prince of Condé, converted P. into a secret partisan of the Bourbons. His remissness, the unwonted folly and awkwardness of his military manoeuvres, though prearranged with the Austrian generals, was not suspected till he suffered himself to be shamefully defeated at Heidelberg, and then retreated, leaving Jourdan (q. v.) without support, thus compelling the latter also to retire. The suspicions of the Directory were now aroused, and being confirmed by the seizure of P.'s correspondence, he was immediately superseded by Moreau (q. v.), and retired to his native town, where he lived till 1797, when he was elected one of the council of Five Hundred. He soon became president; but continuing his intrigues with the Bourbons, he was arrested, and subsequently transported to Cayenne. Escaping in June 1798, he made his way to Surinam, whence he sailed for England. He now entered heart and soul into the Bourbon conspiracy along with George Cadoudal (q. v.), the two Polignacs, De Rivière, and others, the primary object being the assassination of the First Consul. The conspirators secretly reached Paris, and there P. attempted to persuade Moreau, who was also a royalist, to join with them, but

without success. But the plans of the conspirators were soon known to the police; and an intimate friend of P., with whom he resided, sold the secret of his retreat to the police for 100,000 crowns. P. was surprised in his sleep, and carried off naked to the Temple, where he was found dead in his bed on the morning of 6th April 1804. The Royalists have endeavoured to fasten a charge of private assassination on Napoleon, but it is more generally believed that P. strangled himself.

PICHINCHA, an extinct volcano in the west cordillera of the Andes, in Ecuador, about ten miles north-west of Quito. It is of irregular form, and is 14,984 feet in height. Around the crater are two other peaks of nearly equal elevation.

PICHLER, KAROLINE, one of the most eminent novelists of Germany, was born in 1769 at Vienna, where her father, Franz von Greiner, held several legal offices and court dignities. In 1796, she married Councillor Andrew Pichler, and published her first work under the title of *Gleichnisse* (Wien, 1800). This was quickly followed by other writings, as the novels *Olivier* (Wien, 1802); *Leonora* (Wien, 1804); *Ruth* (Wien, 1805), &c.; and the success which attended the appearance of these productions, encouraged her to try a more ambitious line of composition. In 1808 appeared *Agathokles*, which, according to some critics, is the best of her novels. In this work, she endeavoured, in opposition to the views expressed by Gibbon, in his *History of the Decline of the Roman Empire*, to depict the ennobling effect of Christianity on the human mind. At the suggestion of Hormayr and other literary friends, who had been struck by the success with which she threw herself into the spirit of the times of which she wrote, she turned her attention to the task of popularising German history, with the view of fostering a more general feeling of patriotism. Among her best works of this kind, which appeared between 1811 and 1832, and the earlier of which preceded Scott's greatest historical novels, we may instance *Grafen von Hohenberg* (Leip. 1811); *Die Belagerung Wien's von 1683* (Wien, 1824); *Die Schweden in Prag* (Wien, 1827); and *Henriette in England* (Wien, 1832); while of her social novels, the following are among the most popular: *Fräulein Würde* (Wien, 1808); *Die Nebenbuhler* (Wien, 1821); and *Zeitbilder* (Wien, 1840). She died at Vienna in 1843. Her dramas were failures, and in her novels there is not a little tedious diffuseness, a remark which applies with equal truth to her autobiography, which appeared at Vienna in 1844 under the title of *Denkwürdigkeiten a. m. Leben*, and formed part of the edition of her collected works, published at Vienna in 1845 in sixty volumes.

PICKET, in Military Language, has several significations. It applies to a stake shod and sometimes ringed with iron, driven into the ground, and used to sustain ropes, which mark off sections in a camping-ground, or for tying horses to. These pickets are four or five feet long. Short pickets about eight inches long are employed as anchors for the ropes extending tents.—In Fortification, pickets are pointed stakes for pinning gabions together and to the ground; also, when pointed at both ends, and laid close together, of different lengths, and in a position inclined towards the front, they form a powerful obstruction to the advance of a storming-party, having a great effect in breaking a line of soldiers.—Picket was formerly a military punishment, where the culprit was held by the raised arm in such a position that his whole weight fell on one foot, which was supported on a picket with a blunt point. The time the man thus stood was proportioned to the offence. The punishment became,

after a few moments, extremely painful; it has long been discontinued on military grounds.—The word *picket*, when applied to a small guard of men, is undeniably written *Piquet* (q. v.).

PICKLES. Although the term *pickled* is applied to animal substances, such as hush, pick, fish, &c., preserved in salt, yet pickles are generally understood to be the various parts of vegetables preserved in vinegar. The process employed is first to wash the articles intended for pickles in clear cold water, next afterwards to soak them for a few days in a strong solution of salt in water. They are next taken out, and if fruit or roots, dried in a cloth; but if vegetables, such as cauliflower, &c., they must be well drained, and then placed in the vessels intended to hold them, a few peppercorns, or any other spice which is suitable, being sprinkled in from time to time. When the vessel is so far filled that it will hold no more, boiling vinegar is poured in until it is quite full, and tightly covered up. Many persons prefer to boil the spices, of whatever kind used, in the vinegar, and some add the vinegar cold to such vegetables or fruit as are of a naturally soft substance, because, stored in the case of green walnuts, and one or two other fruits, extreme softness is objectionable in pickles. When the materials to be pickled are naturally green, as in the case of gherkins or small cucumbers, French beans, &c., it is considered very desirable to preserve their colour as much as possible; and it is sometimes very successfully accomplished by steeping vine, cabbage, sprouts, or parsley leaves in the vinegar, by which their colour is imparted through the vinegar to the pickles. But this requires great care and patience, more, indeed, than is generally thought worth applying to it, and renders consequently resort to very reprehensible methods of colouring their pickles, such as boiling the vinegar in copper vessels, and thereby forming an acetate of copper, which is green; or even directly adding that salt to the pickles. Many serious accidents have resulted from the presence of this poison.

The principal pickles made in this country are cabbage, almost always made from the red variety; to this is frequently added slices of beet-root, which are an agreeable addition, and improve the colour. The celebrated Spanish pickle is a mixture of the red cabbage and slices of the large Spanish onion. Some housewives, in their efforts to contrivise their neighbours, add a little redness to improve the colour. The spurs considered most suitable for pickled cabbage are white and black peppercorns, ginger, and mace.—*Cauliflowers.* Only the flower portion, with its white branches, is used, and in other respects they are treated as cabbage.—*Gherkins*, or very young cucumbers. These require the same spices as the cabbage; but much care is required to keep as well as possible their green colour. This pickle is the one which British cooks and housewives most pride themselves upon making well; and almost every one has some particular plan for its preparation. A very much approved method is to soak the gherkins in a brine, composed of six ounces of salt to the quart of water for twenty-four hours, then drain or dry in a cloth, place them in jars, and pour in the pickle, composed of vinegar, with an addition to each quart of one ounce salt, black peppercorns a quarter of an ounce, one ounce of ginger slightly bruised, one or two blades of mace, and a dozen bay-leaves. After soaking two days, they are set on the fire until they simmer, and then replaced in the jars, which must be well corked, and covered with skin, to exclude the air.—*French Beans.* The young green pods are prepared in the same way as gherkins.—*Cranes and Asparagus* are carefully peeled, and, after

two days' steeping in brine, covered with boiling vinegar, to which the spices, mostly black peppercorns, has been added. A small variety of beans, called the *olive-bean*, is generally used.—*Walnuts.* These are gathered green, and so tender that a pin can easily be pushed through them; they are useless when the shell has begun to form. They require at least a week's steeping in the brine. The vinegar must be poured on these boiling hot. The spices used are peppercorns, mace, ginger, and sometimes a little garlic and cloves.—*Mushrooms* are sometimes pickled only in brine, and are very useful for greens, &c., in winter-season. They are also preserved in vinegar, and must be washed in salt and water quickly, and then boiled in the vinegar, to which, besides the spices, a small quantity of salt is added.—*Nasturtiums.* The young green fruit or seeds of the *Nasturtium* plant, or greater Indian Cress (*Tropaeolum nasturtium*), make a most excellent pickle, which is an admirable substitute for the foreign capers in sauces for various dishes, and *Alone* is an agreeable pickle.—Several kinds of mixed pickles are made, the chief of which is one called *Mixed*, or 'Indian Pickle,' which consists of a mixture of cucumber, cauliflower, &c., with a considerable quantity of mustard-seed and flour of mustard used as a spice, which gives it a bright yellow colour.

Of the foreign pickles imported from other countries, we have the dispersed seeds of the beautiful plant *Capparis spinosa*, called *Capers*; olives pickled both in brine and vinegar, but chiefly in the former—both from Southern Europe. From tropical countries, every variety of the exquisite green shoots of bamboo—and the fruit of the mango, which is in much esteem wherever it is known, notwithstanding a thurstonian flavour, which is not agreeable at first. Besides these, there are various other pickles of less importance, almost every soft part of wholesome vegetables being adapted for this mode of preparation. Pickles generally are considered preservatives to appetite, and if used judiciously, and made properly, are wholesome and agreeable additions to our food.

PICO, one of the *Azores* Islands, stands midway between the eastern and western extremities of the group, a few miles northwest of Fayal. It is 43 miles long, and 5 miles in average width; area about 225 square miles, pop.—the descendants of Portuguese—about 10,000. It is traversed by a volcanic ridge, which rises 7613 feet high to the Peak (Pico), whence the name of the island. See *Azores*.

PICO, GIOVANNI, DELLA MIRANDOLA, an Italian philosopher and theologian, whose genius is decidedly inferior to the reputation he once enjoyed, was the son of the sovereign prince of Mirandola and Concordia, and was born 24th February 1463. At the age of 14, he was sent to the university of Bologna, and after spending some years there, visited the principal schools of Italy and France, everywhere distinguishing himself by the extraordinary facility with which he mastered the most difficult branches of knowledge. His linguistic acquisitions embraced Latin, Greek, Hebrew, Chaldee, and Arabic, besides Italian and French; he was familiar with the different phases of the scholastic philosophy, and he was also versed in mathematics, logic, and physics. At the age of 23, he returned to Rome, when Innocent VIII. was pontiff, and immediately sought an opportunity of showing his learning in the most striking manner, by publicly putting up no fewer than 500 theses or propositions in logic, ethics, physics, mathematics, theology, natural and celestial magic, drawn from Latin, Greek, Jewish, and Arabic writers, offering to maintain an argument on each

against all the scholars of Europe, and undertaking to pay the expenses of those who came from a distance. P. presumptuously entitled his theses *De Omni Re Scibili* (On Everything that can be Known), and Voltaire sarcastically added, *et de quibusdam aliis*, which addition is as true as it is witty. P. had several encounters with notable scholars, and is reported to have come off victorious on every occasion. But his very success was the cause of misfortune. The church appointed a committee to report on the propositions of the young prince, and the result was that several of them were condemned as 'heretical,' although the author was acquitted of any heretical intentions. P. now withdrew from Rome, and after a short time settled in Florence, where he austere devoted his whole time to the composition of polemical treatises against Jews and Mohammedans, and to the refutation of judicial astrology. Among his closest friends were Politian and Ficino. He died 17th November 1494, at the early age of 31. A complete edition of his works was published at Bologna in 1496; it has since been frequently reprinted. The principal are *Heptaplus, id est de Dei Creatoris Opere sex Dierum Libri Septem*, an allegorical explanation of Creation as recorded in the Book of Genesis; *Conclusiones Philosophice, Cabalisticæ et Theologicæ*—these are the famous propositions which excited so much ferment at Rome; *Apologia Concordiæ Comitibus*; *Disputationes adversus Astrologiam Divinatricem Libri xii.*; *Aureæ ad Familiares Epistolæ*; *De Hominis Dignitate*. P. is a happy illustration of the immediate effects produced in literature by the 'revival of letters'; he is full of a specious kind of universal learning, zealous and enthusiastic, but destitute of originality, depth, or creative power. 'He was,' says M. Matter, 'a prodigy of memory, elocution, and dialectics, but neither a writer nor a thinker.'

PICOTEE. See CARNATION.

PICROTOXINE ($C_{10}H_8O_4$) is the active principle of *Cocculus indicus*, from which it may be extracted by boiling alcohol, or by water containing a little hydrochloric acid. It crystallises in colourless prisms. This substance is extremely poisonous, one-third of a grain being sufficient, when introduced into the stomach of a cat, to produce tetanic convulsions and death in ten minutes.

PICTOU, a thriving seaport on the north coast of Nova Scotia, on the north shore of an ample and perfectly protected harbour, 85 miles in direct line north-north-east of Halifax. Lat. of light-house, 45° 41' N.; long. 62° 40' W. It stands in a fertile and well-cultivated district, with extensive coal-mines and quarries of building-stone in the vicinity. In 1859, it exported 105,528 tons of coal. It also exports building-stone, dried fish, and potatoes. Its commerce is rapidly increasing. The mean summer temperature of P. is 63° 52', and the mean temperature for the year is 42° 09'. Pop. (1861) about 3000.

PICTS, the ancient inhabitants of the north-eastern provinces of Scotland. Everything connected with the history of the P. has been made matter of controversy, and it is not easy to ascertain the truth, where the information given by early writers is so scanty, and where most modern authors seem only to have looked for materials to support a favourite theory.

It will be unnecessary to enter on an examination of the name itself. The 'Picti' of the Romans probably represented a word by which the nation was known in its own language, as well as the barbaric custom to which the well-known expression of Claudian, 'nec falso nomine Pictos,' bears reference. Of much more importance is the inquiry regarding

the origin and language of the Picta. This is what, among Scottish antiquaries, has been emphatically called 'the Pictish question;' respecting which the best-known and most amusing, and certainly not the least useful discussion, is that between Jonathan Oldbuck and Sir Arthur Wardour, in the sixth chapter of *The Antiquary*. The disputants can hardly even now be said to be agreed; but the prevailing opinion is, what sound criticism always pointed to, that the P. were a Celtic race—perhaps the first known inhabitants of Northern Britain, and (as some hold) to be identified with the Caledonians of the Roman writers. At the time when they became generally spoken of under the name of P., they occupied the whole territory north of the Firth of Forth, except the western portion, which had been colonised or subdued by the Scots, another Celtic nation, whose chief seat was in Ireland—the proper and ancient Scotland. The southern boundary of the P. was the Roman province of Valentia, embracing the territory between the two Roman walls. At a later period, when Britain was abandoned by its imperial rulers, the boundaries of the various nations occupying the northern part of the island may be traced with considerable distinctness. Making allowance for partial changes at various times, these boundaries may be held to be the following: The Pictish territory extended along the whole sea-coast from the Firth of Forth to the Pentland Firth. It was bounded on the west by the country of the Scots, which extended along the western coast from the Firth of Clyde to the modern Ross-shire; but the precise line between the two nations cannot be ascertained. The country of the P. was bounded on the south by the Firth of Forth and the province of Lothian, then possessed by the English; while the country of the Scots had for its southern boundaries the Firth of Clyde and the kingdom of Cumbria, held by the independent Britons.

The Pictish nation consisted of two great divisions, called the Northern and the Southern P., the boundary between them being the mountain range known afterwards as the Grampians. These divisions seem at some times to have been ruled by different princes, at other times to have been under one sovereign. The P. were converted to Christianity at different periods. The Southern P. received the faith from St Ninian, Bishop of Candida Casa, early in the 5th century. This is mentioned by Bede, and the fact itself has never been doubted; but controversy, as usual, has been busy with the details. The point in dispute is the situation of the P. who owed their conversion to Ninian (q.v.). A careful examination of the statements of Venerable Bede, and the fuller but less trustworthy narrative of Ailred of Rievaulx, will shew that the Southern P., converted by Ninian, had their seat north of the Forth; that they were, in fact, the great division of the Pictish nation occupying the country between the Firth and the Grampians. The labours of Ninian were carried on and completed by teachers whose names are well known to the readers of ecclesiastical history—Palladius, Serf, Ternan, and others. The Northern P. owed their conversion to a teacher of higher renown—St Columba (q.v.). The life of that abbot, from his leaving Ireland in 563, to his death in 597, was chiefly spent in converting the Northern Picts. Their ruler at this time was Brude, son of Mailcon, whom Bede styles a very powerful king. His chief residence was on the banks of the Ness, and there Columba baffled and confuted the heathen Magi in the manner recorded by his biographer Adamnan. It is impossible to ascertain the precise character of the superstitions held by the P. before their conversion. Those whom Adamnan

called Man, are by some modern writers styled Pictish, and their religion is said to have been a species of Druidism—wasteful that may be held to count.

Brude, the first Christian king of the P., died in 586. Calendars are preserved of more or less regularity, of two sovereigns who succeeded him. It is impossible to remark the discontinuity of those lists, which probably contain the names of persons who reigned at the same time in the northern and southern divisions of the kingdom. The limits of the Pictish territories extended north the same till the middle of the 7th, when a portion of the northern province was subdued by Oswy, king of Northumbria. In the beginning of the reign of Oswy's son and successor, Egfrid, the P. made an attempt to recover the territory which had been wrested from them. It was unsuccessful; and the power of the English was so firmly established, that the conquered province was erected into a distinct separate from Diocletian, the seat of the bishop being fixed at Abernethy. Encouraged by the success which had attended his enterprise, Egfrid seems to have contemplated the subjugation of the whole Pictish kingdom. He advanced northwards with his army; Brude, son of Bili, king of the P., extending before him. The English sovereign passed the Tay, and the P. made a stand at Nechtansmere, supposed to be Dunblane, in Angus. A conflict ensued; the English were utterly defeated, and their king was slain. The consequences of this battle, which was fought on the 20th of May 685, were very important. The P. recovered the whole territory which they had lost, and even added for a time a portion of the proper Northumbrian kingdom.

The next Pictish prince whose name calls for especial notice is Netton, son of Breda, who succeeded about the year 710. He cultivated learning to some extent, and acquired by the position of an ecclesiastical reformer. The Pictish Church held precisely the same doctrine as the English; but it differed in various points of ritual, the most important of which related to the proper time of keeping Easter. The king applied for advice to Chadron, Abbot of Iona; and the answer, which is preserved, "To the most Excellent Lord and most Glorious King, Breda, is preserved among the works of Venerable Bede. Encouraged by this epistle, he surrounded a council of his clergy and nobles, and enjoined them to observe the English manner. The royal command met with a ready obedience. He had also applied to the Abbot of Iona for architects to build a church of stone in the Roman fashion, which he proposed to dedicate to St Peter. We are told by Bede that the architects were sent, but have no further information on this interesting subject. The plans of the king were probably interrupted by dissensions among his people; and the entire assimilation of the religious institutions of Northern Britain to those of England was postponed for four centuries.

The most active of all the Pictish sovereigns was Hargus, son of Urgut, who succeeded in 730, and reigned for thirty years. He was engaged in constant wars with the Scots, the Britons, and the English, in which he was generally victorious. After his death, the kingdom began to decline. The history of its latest period is involved in impenetrable obscurity; all that we know for certain is the final result. Various princes claimed the crown, and held possession of portions of the kingdom, but the most powerful competitor was Kenneth, son of Alpin, king of the Scots, who was descended, by the female line, from the ancient sovereigns of the P., and was probably the true inheritor, according

to the peculiar law of succession which is said to have existed among that nation. Kenneth was acknowledged as king in 843, and fixed his residence at Perth in Strathern, the capital of the Pictish kingdom.

A famous passage from Henry of Huntingdon has often been quoted, in illustration of the supposed utter destruction of the P., of their persons, their race, and their language. It is referred to in that sense at the close of the following sentence of a work written some time ago, but only published in the present year. "The Pictish vessel is sunk in the distant empire; she approached rapidly, till you clearly distinguish the crew upon the deck; but before you are near enough to hear their voices, she sinks, the vessel close over her, and the wreck never can be raised. The total extinction of the Pictish language endures any further inquiry impossible. The annals and writings of the 12th century cannot advance beyond the homely wisdom of the 12th century."—*See Francis Pilgrimage's History of Normandy and England*, vol. iv. p. 294.

The impression conveyed by such words is an erroneous one. The Pictish people still continued to reign in the person of Kenneth and his descendants. They were kings of the P. in reality and by name as much as James I. and his successors were kings of England. The prince did not cease to be one even more than in the other to be sovereign of the larger kingdom, because they had previously ruled in the lesser one. Neither did the nation of the P. cease to exist. They dwelt as before in their own land; their old capital was the capital of the new kingdom; and Pictavia is spoken of by the chronicles long after the accession of Kenneth, and long before Scotia became identified with Northern Britain, or ceased to be the ordinary name for Ireland. Undoubtedly, through the influence of the kings, and perhaps of the clergy, whom the later Pictish princes had held under an oppressive bondage, the Scots became the predominant race, and finally gave their name to the united kingdom and nation. Neither did the language of the P. cease to be spoken. It continued, as before, to be the dialect of the north-eastern provinces, till, first in the extreme north, it yielded to the Scandinavian invader, and afterwards—more than two centuries subsequently to the accession of Kenneth—it began to recede slowly before the Teutonic tongue of English and Flemish colonists. The same process which destroyed the Celtic language of the Pictish people, destroyed also the Celtic language of the British kingdom of Caithness. There is no more reason to question the cause which overthrew the ancient dialect of Fife and Dunbar, than there is to question those which destroyed the old speech of Caithness and Orkney. If anything were wanting to refute completely the popular error in regard to the destruction of the Pictish language, it would be supplied by the recent discovery at Cambridge of a manuscript of the 11th or 12th c. (see *Deen*, Old) which contains the Celtic names for Caithness and Orkney taken from Duns to Abernethy, and how back the Pict, who was then Master of Dunbar, gave them the names of Abernethy and Deen.

The chief ancient authorities for the history of the P. are Adamnan's *Life of St Columba*, edited by Dr Reeves; the *Ecclesiastical History of Venerable Bede*; the *Life of St Ninian*, by Abbot of Rievaulx, in Pinkerton's *Ancient Lives of Scottish Saints*; the Pictish *Chronicle*, in the appendix to Innes's *Critical Essay on the Ancient Substantives of Scotland*, and in the appendix to Pinkerton's *Inquiry into the History of Scotland*; and

PICTS' HOUSES—PIEDMONT.

the *Irish Annals*, edited by O'Connor. The best modern works on the subject are Innes's *Critical Essay*, and his *Civil and Ecclesiastical History of Scotland*; Pinkerton's *Inquiry*; Chalmers's *Caledonia*, vol. i.; Ritson's *Annals of the Caledonians, Picts, and Scots*; Mr Grub's *Ecclesiastical History of Scotland*, vol. i.; and a dissertation 'On the Probable Relations of the Picts and Gael with the other Tribes of Great Britain' in Garnett's *Philological Essays*, pp. 196—204.

PICTS' HOUSES, the name popularly given in many parts of Scotland to the rude underground buildings, more commonly and accurately called **EARTH-HOUSES** (q. v.). The name is often given also to a more advanced class of buildings of the same kind, found in the more northern counties of Scotland. The ground-plan of one of these at Kettleburn, in Caithness, explored and described by the late Mr A. H. Rhind, of Sibster, is figured in the accompanying woodcut. The outmost circle

Pict's House at Kettleburn, Ground-plan.

represents the extreme limits of the mound which covered the structure; *a*, a bounding wall, three feet thick, and three feet high, rudely built of large unshaped stones; *b*, an inner wall, four or five feet high; *c* and *d*, fragments of walls faced outwards; *e* and *f*, passages leading to the inner chambers; *g*, *h*, and *i*, passages leading to smaller side chambers; *k*, a wall within the wall of the chamber *s*; *m*, a chamber, so ruined that its walls could not be traced all round; *n*, a large boulder, which, being difficult to remove, had been built over; *o*, a chamber containing a regularly built well (between *p* and *p*), nine feet deep, and roofed over. The whole walls were built without mortar. The objects found within them were remains of animals and shell-fish, fragments of pottery, and implements of stone, bone, horn, bronze and iron. The name of Picts' Houses is also occasionally given in the north of Scotland to rude stone structures above ground.

PICTURES are now protected by the law in a manner similar to books, the copyright of which belongs to some individual. By the act of 25 and 26 Vict. c. 68, if the author of any painting, drawing, or photograph in which there shall be subsisting copyright, after selling the same, or if any one, without the consent of the proprietor for the time being, repeat, copy, colourably imitate, or otherwise multiply for sale, hire, exhibition, or distribution, or

cause this to be done, or knowingly import into the United Kingdom, or sell, &c. such copies, he shall forfeit to the proprietor of the copyright a sum not exceeding £10, and the copies and materials shall belong to such proprietor. Moreover, if any person affix a mark, monogram, or initials of a person who did not execute or make such work, to paintings, drawings, or photographs, or fraudulently so exhibit, or offer such for sale, such person shall forfeit £10, or double the price of the thing sold, &c., and all spurious copies and imitations become forfeited to the real owner. This statutory protection to artists and owners of pictures, engravings, and photographs extends to the United Kingdom.

PIGUS AND PICIDÆ. See **WOODPECKER**.

PIE, a well-known culinary preparation, consisting of a crust of dough or pastry, enclosing either meat or fruit, and baked in the oven. The origin of the word is very obscure. There are two kinds of pies, one in which a dish is used, as in cases where much juice or gravy has to be retained; the other, without the dish. The latter are called raised pies, and a particular kind of paste is required; which is made with hot lard and water, and must have sufficient consistency to stand up. When moulded into the form or case of the pie, it is filled with meat, usually game, and baked. This kind of crust is not usually eaten with its contents as it is considered unwholesome, it therefore merely serves as a case for the enclosed viands.

PIEDMONT, or **PIEMONT** (Fr. *pied*, *foot*; *mont*, *mountain*), an Italian principality, which now forms the north-west part of the kingdom of Italy, is enclosed mostly by natural boundaries, having on the N. the Pennine Alps, on the W. the Graian and Cottian Alps, on the S. the Maritime Alps and Genoa, and on the E. the Ticino and the duchy of Parma. It includes the former duchy of Montferrat (q. v.), which lies in its south-eastern corner, and the Sardinian portion of the old duchy of Milan, and contains 11,777 English square miles, with a population (1857) of 2,746,884. The mountain ranges which form its boundary on the north, west, and south, attain, in various places, a great elevation above the sea; the *Col de Tende*, *Monte Viso*, *Mont Cenis*, *Mont Iseran*, *Mont Blanc*, *Mont St Bernard*, *Mont Cenis*, *Monte Rosa*, and the *Simplon*, being all on the boundary-line. As to its general character, the country is partly mountainous, partly hilly, and much diversified with hill and dale; the ranges which traverse the country being spurs from the alpine boundary, and converging towards the central tract, through which flow the Po and its chief tributary the Tanaro. The valleys which separate these ranges are all watered by rivers which take their rise in the Alps, and pour their supplies into either the Po or the Tanaro, according as they come from the north and west, or from the south. The amount of the water-supply in the country may be imagined when it is considered that in P. the Po receives no fewer than 10 tributaries on the left, and 6 on the right, all of them of considerable size, and some of them, as the Tanaro and Dora Batea, worthy of being classed as rivers. The valleys of the Po and Tanaro are exceedingly rich and fertile, producing abundant crops of grain, pulse, hemp, chestnuts, olives, and many kinds of fruit. Maize and barley are the chief cereals, the former being the ordinary article of food to the inhabitants, while abundant herds of swine are fed upon the latter. The climate is mild in winter; but in summer, especially on the level country east of the Dora Baltea and the Tanaro, the heat is scorching, and this portion would be

possessed a perfect sandy desert, were it not for one complete system of irrigation, which supplies farmers to more than half a million of acres, and enables the culture to distribute the produce of the country. So valuable is the privilege of using the water of rivers as a means of irrigation, that a considerable tax is levied upon it. The other products of Sicily are wine and silk, which are produced in great abundance, especially silk, which is the chief in Italy, and is generally superior raw. The chief manufactures are silk, linen, woolen, and cotton goods, honey, paper, leather, pottery, various manufactured liquors, glass, and iron. The inhabitants are active and industrious, and firmly clinging to the Roman Catholic religion, but are more tolerant than in other parts of Italy. The Vaulais or Valaisians (q. v.), have from time immemorial inhabited the wild valleys at the foot of the Italian Alps, in the western corner of the peninsula. Many of the Piedmontese, like the Swiss and Tyrolers, spend their youth and early manhood in travelling through other countries as doctors in surgery, pharmacy, and other articles of merchandise, and returning with a small hoard to spend the rest of their days in comfort in their native land.

P., in the 10th c., was possessed by the marquis of Savoy, Lyons, Moutier, and Saluz; and it was not till when, a century afterwards, the marquisate of Savoy passed into the hands of France, that the latter, from conquest of the Marquisate (the south portion of Savoy, gained a footing in the country. At the commencement of the 12th c., the possessions of the House of Savoy were divided, and the lines of Savoy and P. formed (but they were again united, in 1416, by Amadeus VIII, afterwards Pope Felix V.), who, in the following year, obtained from the Emperor Sigismund the title of Duke of Savoy, which they retained for that of king in 1694. During the Spanish War of Succession P. was increased by the addition of the provinces of Aoste, Valais, Val d'Aoste, and the Val di Aoste (1701), by Turin and Novara in 1738—1740, and by Vigevanese and Bobbio in 1743. In 1793, it was seized by the French, and parcelled out into six départements, five being incorporated with France, and one with the kingdom of Italy; but when the fall of Napoleon, the House of Savoy recovered possession of it. See ITALY, SARDEGNA, FRANCE. Since 1860, the name P. as a provincial designation, has been disused; and in the new division of Italy into provinces, the boundaries of P. as a distinct country have been disregarded.

PIEDPOWDER COURT, in England, an ancient custom held by lords and masters to administer justice in a court and ready way to all causes, called also the Court of Trinity land (its chief seat). Its jurisdiction seems to have been confined mostly to petty trespasss, poisons, and other wanderings. The court has long been obsolete, the only jurisdiction of that kind being now merged in the court of Petty Sessions (q. v.).

PIER, the block of solid wall between domes, arches, &c.; also a solid mass of masonry built to support the arch of a bridge. The term is also used synonymously for the Pillars (q. v.) of a church; thus, we speak of nave-piers, &c.

PIERCE, FRANKLIN, the fourteenth President of the U. S. of America, was born in Hillsborough, New Hampshire, November 23, 1804. His father, Samuel Pierpont Pierce, was a soldier of the war of independence, and governor of New Hampshire. Franklin P. was educated at Bowdoin College, Maine, and was an officer in a college military company, in which his biographer, Nathaniel Hawthorne, was a person. He spent his first vacation in teaching a

country school, studied law with Levi Woodbury, governor and senator, was admitted to the bar in 1825, became Speaker of the State House of Representatives in 1828, and was elected to the 33d congress, a democrat of the school of Jackson. In 1847, he was elected to the U. S. senate, of which he was the youngest member. He declined the office of Attorney-general, offered him by President Polk, and refused the nomination for governor of New Hampshire; and at the commencement of the Mexican war, volunteered as a private, but was appointed brigadier-general, and led his brigade in the battles of Chatteras and Churubusco. In 1850, he was chosen one of the mediating officers of the leaders of the Democratic party at the Baltimore Convention, he was nominated as a congressional candidate for the presidency, against General Fremont, the Whig candidate, and received the votes of all but four states. He appointed an able cabinet, including Jefferson Davis as Secretary of War. During his administration, the Missouri Compromise was repealed; the treaty for friendship of trade with the British American colonies was made, and a treaty with Japan; and the Kansas difficulties which then arose, with the growing animosity between the North and South, led to secession, and the war of 1861. At the close of his term of office in 1857, he travelled in Europe, and, having no sympathy with the party which subsequently came into power, has taken no part in politics. His biography was written in 1863, by his friend and classmate, Hawthorne, whom he appointed U. S. consul at Liverpool. Mr P. is a man of marked ability, but probably owed the high position he attained more to amiable personal qualities, than to talent and astuteness.

PICKED, in Heraldry, a term used to indicate that a charge is perforated as to show the field beneath it. The aperture is presumed to be circular, unless some other form, as square, lozenge, or lozenge-shaped, is specified in the blazon.

PIERRE, Jacques HENRI, BENJAMIN DE ST., a celebrated French writer, was born at Bayre, 1794, January 1797. He received his education at Caen and Rennes, and afterwards entered the government department of civil engineers. On his dismissal from this service in 1761, he wandered about the countries for several years, endeavoring to realize his dream of a republican colony. His adventures at St. Petersburg, Moscow, Warsaw, and Dresden, show what an utter simplicity and sentimentalism P. was in his days of life. He returned to France in 1769, and soon after obtained a commission as engineer for the Mauritius, but parted from his companions; and after a residence of three years in the island, he returned to Paris, where he made many literary acquaintances. At this time, he wrote the story of *Paul et Virginie*, while his remembrance of tropical scenery was still fresh. The little book, with its passion, its simplicity, its tenderness, achieved an immense success, and has been translated into almost every language. St P. passed through the storms of the Revolution in safety, and was lucky enough to secure the patronage of Napoleon. From the Emperor, he received the legion of honor and a pension. He died at Brangy-sur-Oise, 21st January 1814. Besides *Paul et Virginie*, he wrote *La Chaudière Indienne* ('The Indian Cottage'), essays, a narrative of his journey to the Mauritius, and several plays. His *Œuvres Complètes*, preceded by a life of the author, have been edited by M. Aimé-Martin (12 vols., 1818—1829).

PIETÀ (an Italian word signifying piety, in the sense in which that term indicates or includes affection for relatives), the name given in the language of art to representations of the Virgin Mary

embracing the dead body of her son. It is a counterpart to the *Madonna* with the infant Jesus in her arms. The one affords an opportunity for the representation of the purest joy and highest motherly love; the other, of the utmost pain and grief. The *pietà* has long been a favourite subject, not only with painters, but with sculptors. A famous one by Michael Angelo is in the Church of St Peter at Rome.

PIETISTS, a designation given since the end of the 17th c. to a religious party in Germany, which, without forming a separate sect, is distinguished not only by certain peculiarities of religious opinion, but also by the manner in which these are manifested. The peculiar character of their religion is very generally denoted by the term *pietism*, which is frequently employed with reference to the same tendencies of opinion, feeling and conduct, where-soever and whensoever exhibited. Pietism may be regarded as consisting in an exaltation of the importance of religious feeling, and of the practical part of religion, with a corresponding depreciation of doctrinal differences, and a contempt for outward ecclesiastical arrangements; and has been more or less strongly developed from time to time in all sections of the church, a tendency towards it always existing in a large class of earnestly religious minds. In the church of the middle ages, this tendency was displayed in an endeavour to attain to a superior spirituality and purity by means of religious contemplation and asceticism, and many, consequently, embraced a monastic life. The Reformers, adopting the Augustinian doctrines, rejected this mode of seeking deliverance from indwelling sin, and proclaimed the efficacy of faith in the sacrifice of Christ. But the controversies which arose among them, and increased among their successors, gradually gave a too exclusively doctrinal and polemical character to the sermons and writings both of the Lutheran and Calvinistic divines, particularly in Germany, and a reaction ensued, not in favour of the Church of Rome, but in favour of a religion of feeling and good works, or of the heart and life. Disgust at the sectarian bitterness and exclusiveness which prevailed, led even to an undervaluing of disputed points; and thus the *Pietism* of Germany was generated and developed. The origin of it is referred to a work entitled *Vom wahren Christenthume*, by John Arndt, published in 1605; to the *Invitatio Fraternalitatis Christi* of John Val. Andrea, published in 1617, both of them Lutherans; and to the writings of Cocceius, a Calvinist. But its fuller development is unquestionably to be ascribed to Spener (q. v.), in the latter part of the 17th c., and to his friends and disciples. The name *Pietists* was first given in contempt to certain young *doctors* in Leipzig, who began in 1689 to give prelections on the New Testament both to students and citizens, and to addict themselves much to a meditative mode of life. Spener had held meetings of a somewhat similar kind in his own house when preacher at Frankfurt-on-the-Maine, and in his writings had urged the necessity of a reform in the Protestant church and theology. He and his followers dwelt much upon the importance of studying the Scriptures rather than the symbolical books, upon the unfitness of any unconverted or unregenerate person for the office of the ministry, upon the right and duty of the laity to take part in the exercises of Christian assemblies, and upon the necessity of a practical rather than a systematic religion. But many of the more extreme Pietists carried their antipathy to the doctrinalism and the established services of the church to a degree that alarmed the theologians of the old school, the high and dry Lutherans, or German 'moderates,' who accused

Spener and his disciples, not without reason, of a tendency to make all goodness and virtue consist in mere religious feeling, or pious sentimentalism; to represent the divine grace as operating in too subtle and abrupt a manner; to exaggerate the value of good works; to depreciate the value of learning and of clear intellectual perception in the study of Scripture, and to indulge in a strictness of judgment upon the religious character of the ordained clergy, tending to sectarianism, and indeed incompatible with ecclesiastical unity. The weapons of argument, however, were not the only weapons employed against them. The doctors were compelled to give up their prelections, and finally to leave Leipzig; the meetings of mutual edification were suppressed by the government as disorderly conventicles; and Francke, q. v., the most distinguished of the Leipzig doctors, having gone to Erfurt, was prevented from lecturing, and quickly compelled to retire. Spener's influence, however, procured a refuge for his friends in the newly founded university of Halle, and Francke obtained a professorship there. Halle became thenceforth the source of new religious influences, and, indeed, of a new religious life to Germany. The Pietists, although spiritually exclusive—disposed to regard themselves as the 'chosen of God' and to look down on all others as 'children of the world,' or even of the devil—did not attempt to form a separate sect. To do them justice they were as far as possible from being ecclesiastically ambitious; all their desire was to excel in 'labours of love,' and to cultivate feelings of intensest piety. The rise of the Wolfian or Rationalistic theology, the spread of that sceptical anti-clerical philosophy which flourished for a while under the name of *Aufklärung* (Enlightenment), exercised an injurious and depressing influence on Pietism; yet through all the obstinate warfare maintained against the doctrine of the church by the Rationalists during the latter half of the 18th, and the most part of the 19th c., Pietism continued to number some adherents; and it can hardly be doubted that it is to the Pietists, and not to the Lutheran dogmatists, that Germany is in a great measure indebted for that revival of religious faith and feeling which, begun with the great Schleiermacher—himself trained up under pietistic influences—has since widely diffused itself through her biblical scholars and theologians. The patriotic enthusiasm called forth by the insolent conquests of the French, naturally allied itself to pietistic tendencies, for in Germany, the triumphs of Napoleon and his emperor were looked upon as the triumphs of revolutionary, republican, and infidel principles; and after the general restoration of peace, the statesmen and upper classes, especially in Prussia, believing that political security could only be obtained by a return of the populace to the simple, obedient, and unquestioning piety of earlier times, countenanced this party in the church, and amiable tea-drinking societies of devout men and women were formed to distribute tracts, and to inculcate the radical and heathen masses with pietistic sentiments. But this attempt to use 'piety' for reactionary political purposes sullied its purity, and alienated from it the very parties whom it wished to influence. Still, however, Pietism exists as a distinct element in the religious life of Germany, and now, as ever, its strongholds are Prussia (Berlin, Silesia, Wupperthal), Hesse, and Württemberg.

PIETRA-DURA, a name given to the finest kinds of Florentine mosaic-work, in which the inlaid materials are hard stones, such as jasper, carnelian, amethyst, agate, &c. The real *pietra dura* work dates as far back as the 16th c.

year 1570; and from that time to the present, has not almost confined to Florence, where a government officer has visited every mine the beginning of the 17th c., which was excavated in order to supply decorations for the Capella Medicea. It is sometimes called *Fluor chalcum*, and *Lavum di piombo*. In the industrial lands, which are sold in 17m, and are manufactured now pretty extensively in Lancashire and other parts of Britain, pieces of covered earthenware are used instead of the harder & more valuable coloured stones.

PIEZOMETER (Gr. *πνεν*, I press; *μετρον*, a measure, an instrument for measuring the compressibility of fluids. Desobry's p. vi) instrument, is fitted by which the compressibility of water was first accurately determined, consisted of a cylindrical case, for inside the neck of which a narrower cylindrical tube of glass, open at both ends, was firmly sealed. In this tube worked an airtight piston by means of a screw. In the interior of the jar was sealed a bottle, whose neck was drawn out into a very capillary graduated tube, and alongside this tube was suspended a cylindrical tube, closed at the top, but open at the bottom. When the compressibility of very liquid was to be determined, the instrument was adjusted in the following manner:—A bottle made was filled almost to the top of the capillary tube with the fluid, and being replaced into the jar, the latter was completely filled with the same up to the piston in the neck. The liquid in a graduated bottle, then under pressure of the same almost it fell slightly in the capillary tube, but kept from contact with the water by an air bubble, the motion of which up or down, according to the pressure was less or greater, served as an index for reading off the graduation. The suspended tube alongside being at first only filled with air, the water rose in it to some extent, of the graduations on the tube it was made to measure the pressure in atmospheres or parts of atmospheres. Pressure was now applied to the case in the jar by steering down the piston; the compressed water communicated the pressure to a liquid in the bottle and to the air in the suspended tube; the descent of the air-bubble in the tube indicating the amount of diminution in the the liquid had undergone (the capillary tube was graduated in inches and parts of inches, and its inch of tube being known to contain a certain volume of the contents of the bottle), while the level of the water in the suspended tube showed a measure of pressure which had been applied.

PIE—see *How*.

PIGEON (Ital. *piccolo*, *piccolo*, or *piccolo*, from *picco*, lat. *apico*, to pierce or thrust, a name sometimes applied, like Dove (p. v.), to all the species of *Streptopelia* (p. v.), and sometimes almost restricted to some still included by ornithologists to the genus *Columba*; having a bill of moderate length, stout, with a little hook at the point, the base of the lower mandible covered with a soft thick skin, its teeth like incisors are present, the feet with long united to the base, and formed both for walking and perching; the wings rather large and pointed, the tail of moderate length and generally square at its end. The species of this group are numerous, and occur in almost all parts of the world. Some of them build their nests in trees, and some in holes in rocks; they lay only two eggs at a time, but need seldom or never in a year, and both the male and the female take part in incubation. The parent of all the varieties of the Duxeter; P. is now almost universally believed to be the Rock P. or Dove (D. *Rock*), the first of the French a bird of extensive geographical range, being found as

far north as the Feroe Islands and on many parts of the coasts of Europe, Asia as far as Japan, and the north of Africa, breeding in crevices of rocks, and often within caverns which open on the sea. It breeds in prodigious numbers in some of the rocky islands of the Mediterranean; and even on the British coast, great numbers are found in some localities, particularly in the Orkneys and Hebrides. Its food consists partly of molluscs and other small animals, partly of grain and seeds; and it often makes welcome visits to the corn-fields of its vicinity. In a wild state, this bird exhibits great uniformity both of size and plumage; being not quite twelve inches in length from the tip of the bill to the end of the tail, the prevailing colour bluish-gray, in some parts with green and purple reflections; two broad and distinct bands of black across the closed wings; the lower part of the back white; the tail deep gray, with a broad black bar at the end; the bill blackish-brown; the legs and feet reddish-orange.—Doubtlessly, nevertheless very generally associated this species with the ROCK DOVE or SMALLER WOOD P. (C. *small*), a species which inhabits woods, and generally builds its nests, preferring the hollows of old decaying trees, or the tops of such as have been pillarded and have become bushy—whence the name *Wood Dove*. In some of the open parts of England, however, it makes its nest in rabbits' burrows or other holes in the ground. It is rather larger than the Rock P.; its prevailing colour is bluish gray, in some parts passing into pale gray, but nowhere into white; the wings (distants of bands); the sides of the neck with green reflections; the breast purplish red. It congregates in large flocks in autumn and winter. It is partially migratory in some parts of Europe; a summer visitant of the northern regions. In Britain, it is found only in the southern parts of

1. Rock Dove, *Columba rock*; 2. Wood Pigeon, *Columba small*; 3. Collared Turtle Dove, *Columba turtur*.

the island. Its geographical range includes great parts of Europe and Asia, and the north of Africa. It feeds on bread-corn, maize, grain, pulses, &c., and sometimes resorts to turnip-fields to eat the tender tops. Its voice is very different both from that of the Rock Dove and that of the Ring Dove.

PIGEON PEA—PIKE.

Its flesh is of very fine flavour.—The RING DOVE, WOOD P, or CUSHAT (*C. palumbus*), is the most common British species, and is diffused over great part of Europe, either as a permanent resident or a summer bird of passage, although it is not found at all in some of the most northern regions; and occurs also in the temperate parts of Asia, and the north of Africa. Its soft loud coo is one of the pleasant intimations of approaching spring. It inhabits woods, and builds its nest among the branches of trees. It is the largest of the British species, being about seventeen inches in entire length. It feeds on green corn, young clover, turnip-tops, grain, pulse, acorns, &c. Where it abounds, its voracity is often very injurious to the farmer. It is gregarious in winter. It is in considerable estimation as an article of food; but it is very shy and wary, not easily approached by an inexperienced sportsman.—These are all the British species of pigeon. Our limits quite preclude us from noticing almost any other. The RING-TAIL P. (*C. Caribbea*) may be mentioned as a West Indian species, much valued for the richness and delicacy of its flesh, which is reckoned one of the greatest luxuries of that part of the world. The BALD-PATE or WHITE-HEADED P. (*C. leucocephala*) is another large and fine species, plentiful in the West Indies. It migrates to the Keys of Florida in summer.—The DOUBLE-CRESTED P. (*C. dilopha*) is a large species, inhabiting the north of Australia and warmer regions to the northward, remarkable for its crest, which consists of two parts, one on the back of the head, and another of lax recurved feathers springing from the forehead, and even from the base of the bill.

Only one species of P. has been truly domesticated, and having long been so, it has undergone many remarkable changes, and there are numerous varieties or breeds; some of them, exhibiting very strange peculiarities, and known as *fancy pigeons*, being carefully preserved and tended by pigeon-fanciers. Pigeon-fancying is nowhere carried further than in London, where there are many persons who give great part of their time to it, and whose pigeons are their chief delight. The prices of such fancy pigeons as are deemed most perfect of their kind, are very high. The ordinary domestic pigeons, kept for profit as a kind of poultry, differ from the wild rock dove chiefly in colour, in which they are often very unlike it, although a tendency always manifests itself to return to the original colours, and the bars on the wings are apt to reappear in the progeny even of what may be called the most artificial varieties. Of these may be mentioned, as among the most interesting, the Rough-footed P., having the feet feathered; the Jacobin, which has a range of feathers inverted over the head, and extending down each side of the neck, as a hood; the Fan-tail, or Fan-tailed Shaker, in which the number of the tail-feathers is greatly increased, and the bird has the power of erecting its tail like that of a turkey-cock, whilst it has also a peculiar vibratory motion; the Tumbler, so called from tumbling in the air in its flight, and further characterised by a very short bill; and the Pouter or Cropper, which has the power of blowing up its crop to an extraordinary degree, so that the head seems fastened on the top of an inflated bladder. The Carrier P. (q. v.) is regarded as a variety of the Common Pigeon.

The law regarding pigeons is stated in the article DOVECOT. For the profitable keeping of pigeons, it is necessary to have a properly-constructed dovecot, divided into cells, a cell for each pair, each cell sixteen inches broad, by twelve from front to back, and the door towards one side, so that the nest may not be seen from without; a slip of wood in front

of each cell for the birds to sit and coo on. The dovecot must be placed at such a height as to be out of the way of rats and other depredators; and must be frequently cleaned, otherwise it may probably be deserted by its occupants. It ought to be painted white, that colour being very attractive to pigeons, and contributing to retain them when a new dovecot is established, in which there is often found to be not a little difficulty. Pigeons begin to breed at the age of nine months, and breed every month except in very cold weather. The male and female continue faithful to each other from year to year, a circumstance noted by Pliny and others of the ancients, and evidently, as well as their somewhat demonstratively manifested affection, a reason of the poetic references often made to the dove.

PIGEON PEA (*Cajanus*), a genus of plants of the natural order Leguminosæ, suborder Papilionaceæ, of which, according to some botanists, there is only one species (*C. flava*), a native of the East Indies, but much cultivated also in the West Indies and in Africa; according to others, there are two species, *C. flava*, with flowers entirely yellow, the pod marbled with dark streaks, and two or three seeds in each pod; and *C. bicolor*, called Congo Pea in the West Indies, the pulse of which is much coarser, and is used chiefly by negroes. The first kind is nearly equal to the Common Pea. This kind of pulse is very much used in tropical countries. The plant is a shrub (*Cytisus caryocarpus* Linnæus) about eighteen inches high. It is half-hardy in the south of England. In tropical countries, the plants stand and are productive for several years. They throw off their leaves annually, and reproduce them along with their flowers. The P. P. is one of the most valuable of the tropical kinds of pulse. It grows either on rich or poor soils. It is called *Doll* and *Urhur* in the East Indies. The name P. P. is West Indian.

PIGMENTS. See PAINTS.

PIKE, PIKEMAN. Previously to the use of the bayonet, infantry of the line of battle—that is, the heavy-armed troops—were from the earliest times armed with pikes or spears. The Macedonians carried pikes 24 feet long; those of modern warfare averaged 12 or 14 feet. They were of stout wood, and tipped with a flat iron spearhead, which sometimes had cutting edges. As a defence against cavalry, the pike, from its length and rigidity, was of great value; but though it long survived the introduction of gunpowder, that event was really fatal to it. For success with the pike, especially in offensive war, a depth of several men was essential, and this depth rendered the fire of artillery peculiarly fatal. The pike is now superseded by the bayonet on the end of the musket.

PIKE (*Esox*), a genus of malacopterous fishes, including all the species of the family *Esoxidae*, is restricted by Müller, and characterised by an elongated body, covered with scales, a depressed head, and broad blunt muzzle, with very large mouth, abundantly furnished with teeth of various sizes on the jaws, palatine bones, and vomer; no adipose fin; and the dorsal fin placed very far back over the anal fin. The species are not numerous; they are all inhabitants of fresh water in the northern hemisphere. Only one is found in Europe, the COMMON P. (*E. lucius*), a native also of Asia and North America. It is very generally diffused over Europe, and is abundant even in its most northern regions; and is now abundant in lakes, ponds, and slow rivers in all parts of the British Islands, although it is supposed not to be truly indigenous to them, but introduced. The statement, which has been often made, however,

PIKE—PIKE-PERCH.

that it was introduced in the reign of Henry VIII., is certainly erroneous, as there is evidence of its existence in England at a much earlier date. Edward I., graciously regulating the price of commodities for his subjects, fixed the price of the pike higher than that of the salmon, and ten times higher than that of the turbot and the cod, from which we may perhaps infer its comparative rarity at that period. Some of the waters in the fenny districts of England are peculiarly adapted to pike, which are there found in very great quantity, and of superior quality.

The P. is of a dusky olive-brown colour on the upper parts, becoming lighter and mottled with green and yellow on the sides, and passing into silvery white on the belly; the fins brown; the larger fins mottled with white, yellow, and dark green. The tail-fin is forked. The P. grows to a large size, occasionally attaining a weight of sixty or seventy pounds, although the stories of pikes much larger than this are liable to suspicion. The excessive voracity of the P. has long been proverbial. No animal substance which it can swallow, and which is capable of being digested, seems to be unpalatable to it; and no animal large enough to attract its attention, and which it can master, escapes being devoured. Mr Jesse mentions an instance of eight pike, of about five pounds' weight each, consuming nearly 800 gudgeons in three weeks; and one of them devoured four roach, each about four inches in length, in rapid succession, and seized the fifth, but kept it in his mouth for about a quarter of an hour before

Pike, or Jack (*Esox lucius*).

swallowing it. The P. readily attacks a fish of its own size, and preys freely on the smaller of its own species. Frogs are frequent prey; water-rats and ducklings are sometimes devoured. A large P. often takes possession of a particular hole in the bank of a river, from which it issues to seize any creature that may pass.—The P. spawns in the beginning of spring, for that purpose ascending narrow creeks and ditches, in which it is very easily caught by nets. Large quantities are caught at the spawning season in Lapland, and dried for future use. The P. grows very rapidly when the supply of food is abundant, reaching a length of 8 to 10 inches in its first year, 12 to 14 in the second, 18 to 20 in the third, and afterwards increasing for a number of years at the rate of about four pounds every year. A young P. is sometimes called a *Jack* or *Pickerel*. The name *Luce* (Lat. *lucius*) is still known as an English name of the pike. The Scotch name is *Gedd*, a name similar to those in the Scandinavian languages.

The flesh of the P. is much esteemed, but that of pikes of moderate size is reckoned superior to that of small, or of very large ones.

The P. is not only caught by means of nets, but by the rod, by set lines, and by *trimmers* or *liggers*, which may be briefly described as floats with lines

attached to them, the line being so fastened that the bait swims at a proper depth, and that some yards of line run out when the bait is taken. The floats are sometimes made of wood or cork, sometimes of bundles of rushes, sometimes of bottles. In angling for P., various baits are used, such as a minnow, par, or other small fish, a portion of a fish, &c., and sometimes an artificial fly is employed with great success, made of two large hooks tied together, and adorned with two *moons* from a peacock's tail. The angler unaccustomed to the P. must be cautioned as to the manner of the taking the hook from its mouth, as any rashness may lead to severe laceration of his hand by its teeth. P. may be fished any time from May to February inclusive, except when it is actually freezing. The best month is considered to be

Pike Spinner.

November; the P. are then in the best condition. One of the most approved tackles for angling for the P. is the *Spinner*, baited with a small dace, bleak, gudgeon, or par of about two ounces, as represented in the fig. The mode of using it is thus described in Bailey's *Angler's Instructor* (Longman & Co. 1857): 'Having cast your bait as far as possible, allow it, if you are fishing in a pond, or lake, or deep water, to sink a little, say two feet, then wind away at a brisk rate, holding your rod on one side rather low; if no run, wind out and throw again, but this time wind brisk four or five yards, then all of a sudden stop a moment, then off again, doing so three or four times in one cast. I have often found this a good plan. If you still have no run try another throw and wind brisk as before, but occasionally giving your rod a sharp but short twitch.' See also Otter's *Modern Angler* (Alfred and Son, London).

Other species of P. are found in the lakes and rivers of North America, as *Esox estor*, which is sprinkled with round blackish spots, and *E. reticularis*, which is marked with a network of brownish lines.

The Gar-fish (q. v.) is sometimes called the Sea Pike. The same name is also given to certain large voracious fishes of warm seas, belonging to the perch family.—The Saury P. is noticed in a separate article.

PIKE-PERCH (*Lucioperca*), a genus of fishes of the perch family, having two dorsal fins, of which the first has strong spiny rays, but resembling the pike in its elongated form, large mouth, and formidable teeth. The muzzle is not, however, broad and depressed, as in the pike. Several species are known, of which one (*L. sandra*) is common in the Danube, and in most of the rivers and lakes of the north-east of Europe, extending westward to the Oder and the Elbe, although not found in Italy, France, or Britain. It is highly esteemed for the table, and its introduction into British rivers seems particularly desirable. Salted and smoked, it is a considerable article of trade in some parts of Europe. It is a fish of rapid growth, and attains a weight of 25 or 30 pounds. This fish readily takes the minnow and the artificial fly. It is called *Sander*, *Sandel*, or *Sandat*, in some parts of Germany; *Nagmaul* in Bavaria; and *Schill* at Vienna.—Another species (*L. Americana*), much resembling it, of a greenish-yellow colour, is found in the lakes and rivers of North America.

PIKE'S PEAK, a peak of the Rocky Mountains, in the U.S. territory of Colorado, lat. 39° N., long. 105° W., discovered by General Pike, U.S.A., in 1806. It is made by different measurements 12,000 and 14,500 feet high, and commands a view, of 100 miles' radius, of a rugged, mountainous country, containing many lakes, and the sources of four great rivers—the Platte, Arkansas, Rio Grande, and Colorado of California. In 1859, large deposits of gold were discovered in this region; and in 1860 it had a population of 60,000, and produced 4,000,000 dollars in gold. It abounds in rich gold-bearing quartz. The mining country is 5000 feet above the sea, with a dry climate, having a rainy season of only seven weeks. Denver City, the capital of the territory, has a population of 6000.

PILA'STER, in Classical Architecture, a square pillar, sometimes standing free, but usually attached to a wall, from which it projects $\frac{1}{4}$ th, $\frac{1}{2}$ th, or other definite proportion of its breadth. Greek pilasters, or antæ, were of the same breadth from top to bottom, and had different capitals and bases from those of the orders with which they were associated. The Romans gave them a taper like the columns, and the same capitals and bases.

Pilaster.

PILAU, or **PILAW**, a dish common in India, Turkey, Egypt, and Syria, consists generally of rice, but occasionally some animal food is added. It is sometimes seen at tables in this country, prepared for those who have been accustomed to it abroad. The correct method of preparing it is to boil the rice for twenty minutes, with sufficient water to soak it thoroughly, and swell the grains to their utmost, taking care not to break them by making them too soft; it is then drained, and gently stirred with butter, pepper, and finely-chopped onions, and served up. This is the way in which the pilaws of the poorer classes are prepared; but for the tables of the more wealthy, fowls, lamb, mutton, shreds of ham or bacon, variously cooked, but always much boiled or roasted, are placed on the top of the rice, and served up with it. In India, very numerous and elaborate receipts are in use.

PILCHARD (*Clupea pilchardus*, or *Alausa pilchardus*), an important fish of the family *Clupeidae* (q. v.), referred by some naturalists to the same genus with the Herring (*Clupea*), and by others to the same genus with the Shad (*Alausa*). The P. is

Pilchard (*Clupea pilchardus*).

nearly equal in size to the herring, but rather thicker, and the lines of the back and belly are straighter; the scales are also larger and fewer; and the dorsal fin is rather further forward. The mouth is small, and in the adult fish destitute of

teeth; the under jaw longer than the upper. The upper part of the body is bluish-green; the sides and belly silvery white; the cheeks and gill-covers tinged with golden yellow, and marked with radiating stripes; the dorsal fin and tail dusky. The P. is an inhabitant of more southern seas than the herring, being nowhere plentiful on the British coasts, except in the extreme south, and chiefly on the coasts of Devonshire and Cornwall; whilst it occurs on many parts of the Atlantic coasts of France and Spain, and on the coasts of Portugal, and is found in the Mediterranean Sea. Like the herring, it was formerly supposed to be a migratory fish, annually visiting the coasts of England and other countries; but, as in the case of the herring, this opinion has now been relinquished; and the shoals of pilchards which are seen on the coasts are believed merely to issue from deeper waters near at hand, for the purpose of spawning. The spawning season of the P. begins early in summer; but on the coasts of Devonshire and Cornwall, the principal fishery is in August and September. Pilchards are caught either with drift-nets or sear-nets, but principally with sear-nets. By means of one or more sears, each 360 feet long and 36 feet deep, a shoal is enclosed; the bottom of the net is then drawn together by a peculiar contrivance, and the pilchards are taken out at low water by small bag-nets. Prodigious numbers are sometimes enclosed in a single sear. Twenty-four millions and a half are said to have been taken at once from a single shoal, which, however, may have been spread over several square miles. The approach of a shoal of pilchards is known by the rippling of the water, and the sea-birds hovering above, and is often watched for and marked from the shore. The P. fishery on the English coast has of late been comparatively unsuccessful, probably undergoing one of those unaccountable mutations of which there are so many examples in the herring fishery in different places; but in some years the quantity taken has been very great, and the capital invested in the P. fishery in Devonshire and Cornwall is probably not much under one million sterling. The English P. fishery is regulated by several acts of parliament, the first of which are of the days of Elizabeth. Great quantities of pilchards are annually exported to the West Indies and elsewhere. Those intended for exportation are pickled, and packed in barrels by means of great pressure, by which the bulk is reduced, and oil is expressed to the amount of three or four gallons from a hoghead of fish. The oil, with the blood and pickle with which it is mingled, is generally used for manure. A favourite Devonshire dish is a pie made of pilchards, with their heads protruding from the crust.—A great number of boats are employed in the P. fishery in and near the estuary of the Tagus.—The P. is known on the coasts of Scotland as the *Gipsy Herring*.

PILCOMAYO, a river of South America, whose course has not as yet been thoroughly explored, draws its waters from the Bolivian Andes, and is formed by the confluence of two rivers, the Suipacha and the Pilaya. Of these head-waters, the south one, the Suipacha, rises in the mountains immediately south of Potosi; while the northern branch, the Pilaya, drains the valleys around Chuquisaca. These streams unite in lat. about 21° 35' S., to form the P., which flows in a general direction south-east, crosses the Bolivian frontier, waters the north-east region of the Argentine Confederation, and falls into the Paraguay a few miles below Asuncion. It is at least 1200 miles in length; but its waters are much spent in lagunes on its course, so that it adds no great volume to the waters of the Paraguay. It is navigable for about 500 miles; but numerous

barrier of hostile Indians render navigation perilous. Indians crossing the Paraguay, it divides into two arms, of which the northern is called Araguay-Itane; and the southern, which is again divided into two branches, the Araguay-Mian. The mouths of the P. are narrow, deep, and much obstructed by water-plants.

PILE, in Heraldry (from Lat. *pila*, a javelin; or from the pile or stake used in the construction of a bridge), an ordinary, or, according to some

Fig.

variable, a saltire, in the form of a wedge issuing generally, as in fig. 1, from the middle chief, and extending towards the middle base of the shield. It is said that a pile should occupy one-third of the breadth of the chief, or, if charged, divide that breadth. When a pile is borne issuing not from the middle chief, but from some other part of the bounding-line of the shield, this must be pointed in its blazon. Three piles are sometimes borne ensigned in point, as in fig. 2. A pile ensigned is one whose point is upward.

PILE-BRIDGE, a bridge of which the piers are built with piles. These may be either temporary wooden structures, in which wooden piles driven into the ground, serve also as piers, or they may be permanent bridges, with iron cylinders forming the piers below the surface, and piers above. See *BRIDGE*.

PILES are usually squared logs of wood used in engineering operations, such as dams, bridges, roads, &c. They are sharpened at the point, and, if necessary, protected with iron points, to enable them to cut through the strata they encounter as they are driven into the ground. When used for caissons, or such temporary purposes, they are placed close together, and driven firmly into the earth; the water is then pumped out, and the piles form a dam, to enable workmen to lay foundations of piers, &c. When the force of the water round the dam is great, two rows of piles are driven in all round, and the space between the rows filled with clay, and grout. Piles are also used for permanent works, when they are driven through loose soil till they reach a firm bottom, and thus form a foundation on which buildings, roads, &c. may be placed.

Caisson is frequently used for piles, which are not hollow. When walls are sometimes built of piles, they are then cast with grooves on the sides, and which sustain plates (forming the walls) are added.

A kind of pile has been invented by Mr Mitchell, which is of great use in very loose and shifting substances. It is called the screw-pile, and consists of a long shaft (of wrought iron), with a broad cast-iron disc, of a screw form at the lower end. These piles are especially useful for light houses, beacons, &c., which have to be placed on sands. They are fixed by means of cranes, which give them a rotary motion. Cast-iron piles are driven in by mallets, or called *piledrivers*. In these, a heavy weight (or mallet) is raised to a considerable height between two piles, and then let fall on the head of the pile. The application of steam to these drivers has made them very powerful engines—Tanner's screw-hammer being a well-known name.

In 1821, Dr L. H. Potts obtained a patent for a new kind of pile, which consists of hollow tubes of iron, some with the sand, &c., within them is

removed by means of an squeegee, and the pipes are then cast.

In recent roadway bridges, cylinders have been much used to form both piers and piers. They are of cast iron, and made in pieces of about 6 feet in height, which are applied one on the top of another. The sand or gravel is removed from the inside of the first laid, which then sinks down; another cylinder is placed above it, and the same process continued till it also has sunk sufficiently; and so on, cylinder over cylinder, till a solid foundation is reached. The requisite number of cylinders is then piled up to form the pier above ground.

PILES, or *HEMORRHOIDS*, are small tumours situated either within or on the verge of the anus. They consist of folds of mucous and sub-mucous membrane in an indurated, inflamed, or permanently thickened condition, and usually contain enlarged veins. There are several varieties of these tumours. Sometimes the pile is merely composed of a little knot of capillary vessels in the sub-mucous tissue; in this case, it is easily emptied, by pressure, of the fluid blood contained in it, which, however, returns when the pressure is removed. Sometimes the blood in a dilated vein coagulates, forming a solid tumour surrounded by fibres, thickened in consequence of inflammation; or the tumour may consist of a knot of ossified tissue formed by an abnormal condition of the vessels of the mucous membrane; this variety is especially liable to bleed. These tumours are divided into *bleeding* and *blind* piles, according as they are or are not accompanied with hæmorrhage; and into *internal* and *external* piles, according as they are within or without the sphincter muscle of the anus.

The following are the general symptoms of this affection. The patient, after having experienced for a varying time a feeling of heat, fulness, and dull pain about the lower part of the bowel, becomes conscious of a sensation as if there were a foreign body in the anus; and on examination after an evacuation, discovers a small tumour, usually about the size of a grain, which either remains outside, or is retracted, according as it originated without or within the sphincter. This tumour gradually increases, and others form around it, until a mass at length results as large as a pigeon's egg, or larger. In its ordinary history, the tumour has little sensibility, and assumes comparatively little annoyance; but when it is *inflamed* (from strangulation of the sphincter muscle, or from any other cause), it is exquisitely tender to the touch, and is the seat of burning and stinging sensations, rendering the evacuation of the bowels (and sometimes of the bladder also) difficult and painful. In women, an inflamed pile may cause pain in the back, irritation of the womb, with unusual discharge, and many other anomalous symptoms. In severe cases, the patient can neither stand nor sit with comfort, and only finds relief in the horizontal position.

Piles may be caused by any circumstances which cause congestion in the lower bowel, such as luxurious and sedentary habits of life, pregnancy, and such diseases of the liver as tend to check the return of blood from the veins of the rectum. Moreover, anything that causes irritation of the rectum, such as acrid purgatives and especially aloes, dysentery, inflammation of the prostate gland, &c., may cause piles. But of all causes, constipation is probably the most frequent; it operates in producing them partly by the pressure of the accumulated and hardened feces upon the veins carrying the blood away from the rectum, and partly by the straining and irritation such feces occasion during their evacuation.

In the treatment of piles, it is expedient to relieve

the congested state of the lower bowel by one or two doses of sulphate of magnesia, and a cooling vegetable diet, after which the continued use of mild laxatives should be resorted to. A teaspoonful of an electuary, consisting of an ounce of confection of senna, half an ounce of cream of tartar, and half an ounce of sulphur, if taken in the middle of the day, usually acts gently about bedtime, which is far the best time for the bowels of patients of this kind to act, as the parts irritated by the passage of the evacuation become quieted during the night. In long-standing cases, in which there is general relaxation of the mucous membrane, the confection of pepper in doses of a drachm may be given thrice daily with advantage, or a scruple of common pitch may be taken at bedtime in the form of pills or in capsules. Amongst the milder forms of local treatment must be mentioned (1) the injection of the rectum with cold water both before and after the motion; (2) washing the anus with yellow soap and water after each evacuation; (3) the application of gall ointment or of other astringents; and (4) the injection of astringent lotions, as, for instance, of sulphate of iron, in the proportion of a grain to an ounce of water. If these fail, recourse may be had to pressure by means of instruments specially devised for the purpose; to the application of strong nitric acid, which, in the case of internal piles, affords the most speedy and effective means of relief (the operation must, of course, be performed by a surgeon, and if the parts cannot be protruded, the acid must be applied through the speculum); to ligature; or, in the case of external piles, to excision. When the piles are inflamed, leeches to the anus (but not applied directly to the tumours) are sometimes required; but the inflammation generally subsides under the influence of rest in the horizontal position, fomentations, poultices, and low diet.

The treatment of the hæmorrhage that frequently accompanies piles requires a few words. If the bleeding is moderate in quantity, and has continued for some time without inducing weakness or any other bad symptom, it is not expedient to interfere with it. When, however, it obviously requires checking, the effect of cold water injected into the rectum, as already recommended, should be tried, and, in case of its failing, astringent injections should be had recourse to. At the same time, the patient should remain in the horizontal position, and take the medicines usually prescribed for internal hæmorrhage, amongst which may be especially mentioned oil of turpentine, in doses of twenty drops three or four times a day, or ergot of rye in divided doses to the extent of a drachm daily. In rare cases, it is necessary to tie a vessel, or to touch it with a red-hot wire (through the speculum), or to plug the anus.

PILEUS. See FUNGI.

PILEWORT. See RANUNCULUS.

PILGRIM (Ital. *pellegrino*, Lat. *peregrinus*, 'a foreigner,' 'a visitor of foreign lands'). A pilgrim is a person who has undertaken, especially under vow, to visit, for the purpose of prayer and religious worship, some shrine, sanctuary, or other place, reputed to possess some especial holiness or religious interest. That the early Christians—as had been the habit of the Jews, and indeed of the pagan Gentiles also—regarded certain places with some sort of religious interest, seems beyond all question; and among all the places thus reputed as sacred, or at least venerable, the first rank was given to the Holy Land, and particularly to the scenes of the Passion of our Lord at Jerusalem. St Jerome (Ep. xlv.) speaks of the practice of

visiting Jerusalem as established ever since the discovery of the Holy Cross by St Helena, the mother of Constantine. He himself was a zealous pilgrim, and was followed by many of his friends and disciples; and throughout the 4th, 5th, and 6th centuries, pilgrims habitually undertook the long and perilous journey to the Holy Land from almost every part of the West. Other sacred places, too, were held to be fit objects of the same visits of religious veneration. The tombs of the apostles Peter and Paul, and the many tombs of the martyrs in the catacombs at Rome, are so described by St Jerome (*Commentar. in Ezekiel*). St Basil speaks in the same terms of the tomb of the Forty Martyrs; and the historian Theodoret tells of a practice exactly similar to that still seen in Catholic countries, of not only visiting such sanctuaries, but of hanging up therein as offerings, gold and silver ornaments, and even models of hands, feet, eyes, &c., in commemoration of the cures of diseases of their several members, believed to have been supernaturally obtained as the fruit of these pious visits. The PILGRIMAGE, however, pre-eminently so called, was that of the Holy Land; and even after Jerusalem had been permanently occupied by the Saracens, the liberty of transit for pilgrimage, on payment of a stated tax, was formally secured by treaty; and it was from the frequent violation of this immunity, and the necessity of protecting pilgrims from outrage, that the well-known MILITARY ORDERS (q. v.) had their origin. The CRUSADES (q. v.) may in some sense be regarded as a pilgrimage on a great scale; and the direct object of all the expeditions was to secure for the Latin Christians the permanent immunity of pilgrimage. On the other hand, the closing of the Holy Land against western pilgrims, consequent on the final abandonment of the Crusades, led to a great extension of what may be called domestic pilgrimage, and drew into religious notice and veneration many shrines in Europe, which, after the lapse of time, became celebrated places of pious resort. The chief places of pilgrimage in the West were: in Italy—Rome, Loretto (q. v.), Geneteano, Assisi; in Spain—Compostella, Guadalupe, Montserrat; in France—Fourviers, Puy, St Denis; in Germany—Oetting, Zell, Cologne, Trier, Einsiedeln; in England—Walsingham, Canterbury, and many others of minor note. The pilgrim commonly bound himself only by a temporary vow (differing in this from the palmer), which terminated with the actual visit to the place of pilgrimage, or at least with the return home, and by which he was bound for the time to chastity and to certain other ascetic observances. The costume consisted of a black or gray gabardine, girt with a cincture, from which a shell and scrip were suspended, a broad hat, ornamented with scalloped shells, and a long staff. Many abuses arose out of these pilgrimages, the popular notions regarding which may be gathered, although, probably, with a dash of caricature, from Chaucer's *Canterbury Tales*.

PILLAR, a detached support like a column; but its section may be of any shape, whereas the column is always round. Pillars have been used in all styles of architecture, and their forms and ornaments are usually amongst the most characteristic features of the style. The Greek and Roman pillars (or columns) are the distinguishing elements in the various orders. In Gothic architecture, also, the pillars are of different forms at the various epochs of that style. First, in the Norman period, we have plain massive pillars, square, circular, and octagonal, frequently ornamented with zigzag ornaments, spiral bands, &c., on the surface (fig. 1). As vaulting progressed, the

PILLAR SAINTS - PILLORY.

system of breaking the plain surface, and giving to each portion of the shafting a separate little column or shaft to support it, was introduced.

This was done either by attaching shafts to the circular pillars, or by cutting nooks in the pillar and setting little shafts in them, thus: a, b, fig. 2.

In the Early Painted Style a plain circular or octagonal pillar, with a number of small shafts attached around it, is a favourite arrangement; thus: c, d, fig. 2.

In this style, the attached shafts are very frequently loaded to the main pillar at different heights, and they are sometimes made of a fine material, such as Parian marble. In the Decorated Style the pillar is of a four-leaf form, and not so much ornamented with detached shafts as with

mouldings: plain, circular, or octagonal pillars, however, are used in this, as in all the styles. The mouldings and shafts are usually aligned, and

FIG. 2.

some of the mouldings run up into the arch without any cap. In perpendicular the same idea is further carried out; the mouldings become thinner, and are more frequently run up into the arch without caps. See PLAINOYANE.

PILLAR SAINTS—called also 'STYLITES' (Gr. from *stylos*, a column), 'Pillarists,' 'Holy Hermits,' 'Air Martyrs,' and several similar names—a very remarkable class of ascetical Ascetics (see ASCETISM), chiefly of Syria, who, with a view to separating themselves more completely from earth and fellowship, took up their abode on the tops of pillars, on which they remained without ever descending to earth, and exposed in all the variations of a Syrian climate. The earliest of them, and the most celebrated, Simeon (called also Simon) the Stylite, had been a monk, and had lived, in the beginning of the 5th c., in extreme seclusion in his monastery for nine years, without ever moving from his narrow cell. Increasing in enthusiasm, he withdrew to a place about 40 miles from Antioch, where he built a pillar,

on the top of which, only a yard in diameter, he took up his position. From this pillar he removed to several others in succession, each higher than the predecessor, till at last he attained to an edifice, or about 60 feet, in height. In this mode of life he spent 37 years, his neck bared with an iron chain, and his lips engaged in constant prayers, during the duration of which he beat his body so that his backbone touched his feet. His power of fasting was no less marvellous; he is said to have frequently fasted himself in a single week in the week, and during the forty days of Lent abstained entirely from food. The fame of his sanctity brought crowds of pilgrims from the most distant countries, even Britain itself, to see him; and the admiration of his countrymen is said to have converted many pagans and heretics in the district. In trial of his virtue, through the heat of humanity, some neighbouring monks expressing him with rudely, and the love of novelty to this extraordinary mode of life, ordered him to come down from his pillar. Simeon prepared without hesitation to comply, and the compliance was accepted as an evidence of his perfect humility and freedom of purpose. It is said that in consequence of an ulcer which was formed on one of his legs, he was obliged for the last year of his life to remain on his pillar upon one foot. In this position he died in 489, aged 72 years. A disciple of Simeon, named Daniel, succeeded to his reputation for sanctity; and in his mode of life, which he maintained for 23 years, in the still more trying climate of the shores of the Bosporus, about 4 miles from Constantinople. The miracle of Daniel's career are still more startling. He was sometimes almost blown by the winds of Thana from the top of his pillar. At times for days together he was covered with snow and ice. How he sustained life, what nourishment he took, was a mystery even to his disciples. The emperor at length insisted on a covering being placed over the top of the pillar, and Daniel survived till the year 524. In Syria there were many pillar saints as far down as the 12th c.; but in the west, Daniel is all but a solitary example. A monk named Wallichich, near Trier, attempted the pillar-life in the 6th c., but the neighbouring bishops compelled him to desist, and destroyed his pillar.

PILLNITZ, a palace and ordinary summer residence of the royal family of Saxony, in a beautiful situation seven miles south-east of Dresden. The grounds are finely diversified, and the walks ascend to the summits of hills, of which one is nearly 100 feet high. P. acquires a historic interest from the meeting of princes held in the castle in August 1791, when the Declaration of Pillnitz was framed, according to which Austria and Prussia agreed to declare the circumstances of the King of France (then a prisoner in the Tuileries, after his ineffective flight to Varennes) to be a matter of common interest to the sovereigns of Europe, and to express the hope that common cause would be made for his restoration. The emperor and the King of Prussia were resolved to use force in order to effect this result; but any immediate interference on their part was rendered unnecessary by Louis's acceptance of the constitution as modified by the National Assembly, after which he was again placed on the throne.

PILLORY, an engine for the public punishment of criminals, devised in Britain since 1537; but previous to that time commonly employed, as it also was in France and Germany. It consisted of a stout plank fixed like a sign-board on the top of a pole, the pole being supported on a wooden platform elevated above the ground. Above and

parallel to this plank another of similar dimensions was placed in a similar position with respect to the pole, and fixed to the former by a hinge, being thus capable of being moved upwards from it, or closed upon it, when necessary. A large circular hole is cut, with its centre in the line of junction of the two planks, and two corresponding holes of smaller size are formed, one on each side of it; the large hole is for receiving the neck, and the two smaller the wrists. When a criminal is to be placed in the pillory, he is made to mount and stand upon the platform; the upper of the two hinged planks is raised to allow the culprit's neck and wrists to be inserted in their proper grooves, and then brought down into its place, and fastened by a padlock, or in some other way. See for illustration the wood-cut to the article OATES, TRUS. The pillory seems to have existed in England before the Conquest, in the form of the stretch-neck (an instrument by which the neck only was confined), and was originally intended, according to the 'Statute of the Pillory' (51 Hen. III. c. 6), for 'forestallers, users of deceitful weights, perjury, forgery, &c., and all such dishonourable offences. Its use was exclusively confined to this class of offenders till 1637, when restrictions were put upon the press, and all who printed books without a licence were put in the pillory. From this time it became the favourite mode of punishing libellers (or those who were considered to be such by the government), authors and publishers of seditious pamphlets, or of strictures on the government; and many eminent men were accordingly from this time put 'in and on the pillory,' among whom may be mentioned Leighton, Lilburn and Warton the printers, Prynne, Dr Bastwick, Daniel Defoe, &c. The insufficiency of the pillory as a means of inflicting a definite amount of punishment was now apparent, for to those who were popular favourites it was no punishment at all, while those who were objects of popular dislike were ill-used to such an extent as occasionally to cause death. The sufferers above mentioned being popular favourites, or having at least a numerous class of supporters, were shaded from the sun, fed, and otherwise carefully attended to; while the encouragement, applause, and sympathy of the crowd around converted the intended punishment into a triumph, but such men as Titus Oates, and the class of offenders including perjurers, swindlers, polygamists, &c., who were objects of popular hatred and disgust, were pelted with rotten eggs (the favourite missile), garbage, mud, sometimes even with more dangerous missiles. In 1814 the celebrated naval hero Lord Cochrane (see DUNDONALD, EARL OF) was sentenced to the pillory, but the government of the day was not prepared to brave the consequences of such an act, and the sentence was not carried into effect. In France the pillory was anciently called *pilori*, and in recent times *carcan*, from the iron collar by which the criminal's neck was attached to the post; but punishment by this mode was abolished in that country in 1832.

PILLS are the most generally convenient and popular of all forms of medicine. They are formed from masses of a consistence sufficient to preserve the globular shape, and yet not so hard as to be of too difficult solution in the stomach and intestines. This form is especially suitable for (1) all remedies which operate in small doses, as metallic salts; (2) those which are designed to act slowly and gradually, as certain alteratives; (3) those which are too readily soluble when exhibited in other forms; (4) substances whose operation it is desirable to retard until they have reached the lower intestines, as in certain pills for habitual costiveness; (5) bodies whose specific gravities are

too inconsiderable to allow their suspension in aqueous vehicles; and (6) fetid substances: while it is unsuitable for (1) medicines which require to be given in large doses; (2) deliquescent salts; (3) fluid or semi-fluid substances, such as oils, balsams, &c., which require a very large proportion of some dry powder to render them sufficiently tenacious to form into a mass; (4) substances so insoluble, that when exhibited in solid form they pass through the intestinal canal unaltered, as extract of logwood (*Paris's Pharmacologia*, 9th ed. p. 550). Many substances, such as vegetable extracts, may be at once formed into pills without any addition; but most substances require the addition of a material termed an excipient for converting it into a pill-mass. The excipients in most common use are bread-crumbs, hard soap, extract of liquorice, mucilage, syrup, treacle, honey, castor oil, and conserve of roses. From the property of preserving pills for a long time in a properly soft state, the most valuable excipient is the conserve of red roses; and, perhaps, next to it treacle is the most valuable excipient, as it does not undergo any change by time, but maintains a proper consistence, and preserves the properties of vegetable powders unimpaired for years. It is common to place pills in some fine powder, to prevent them from adhering to each other, and to conceal their taste. For this purpose, liquorice powder, wheat flour, starch, and magnesia are generally used in this country, and lycopodium on the continent. Pills retain their moisture and activity far longer in small bottles than in the ordinary pasteboard boxes. The ordinary weight of a pill is five grains; if it much exceeds that weight, it is too bulky to swallow conveniently if it consist of vegetable matter. It is very common to meet with patients who express their inability to take this form of medicine. If, however, they practise with a small globular mass, towards which they feel no repugnance, as a pellet of bread or a currant, placing it on the back of the tongue, and gulping it down with water, they will soon get over the difficulty.

PILOT is a person specially deputed to take charge of a ship while passing through a particular sea, reach, or dangerous channel. The intricacy of almost all coast navigation renders it impossible that any navigator, however skilful, can be master of all the waters to which he may have to sail his ship; and the risk of failure, through ignorance of local dangers, is therefore avoided by transferring the direction of her course to some one perfectly acquainted with the spot. The man to whom so much is intrusted must be a responsible person, and therefore in all countries qualified sailors are officially licensed to act as pilots in their districts, and they are granted the monopoly. The origin of the word pilot is uncertain; but it is probably taken from or nearly identical with the Dutch *pijlloot*, which is compounded of *peilen*, to sound the depth, and the root which appears in *D. lootsman*, *O. E. lodesman*, and signifies to lead, direct. Pilot thus means one who conducts a vessel by sounding. The laws of Wisby, promulgated at least as early as the 14th c., and subsequently incorporated in nearly every maritime code, render it compulsory on the master of a ship to employ a pilot when sailing near a coast.

The British laws relating to pilots were revised and consolidated by the act 16 and 17 Vict. c. 129. Certain fees are established in proportion to the distance and responsibility; and the master of every vessel, above 50 tons, passing up the Channel or the Thames, or *vice versa*, is required to accept the services of the first pilot tendering, provided he

shows his licence as a proof of qualification. Kept in matters of discipline, the command of the vessel is then vested entirely in the pilot, who may leave the vessel morning, fore, or the ship carried on exactly as his discretion until the limit of the pilot's district is passed, except that the captain exercises his powers when the question of taking up ground in a harbour is concerned. The fees vary with the draught of the ship and the distance; as sometimes may be cited the highest and lowest in the London district: a ship drawing 22 feet of water is piloted from Orfordness to Blackwall for 50s.; the : a ship drawing not more than 7 feet is piloted from Gravesend Reach to Long Reach for 30s. only.

Pilots are associated in guilds called *Reverberations*, of which the principal are the *Reverberation of the Twenty Houses of Deptford-district*, situated on Tower Hill, which has jurisdiction over the Thames, Medway, and the coast from Harwich to the Isle of Wight; and the *Twenty Houses of Kingston-upon-Thames and Newcast-on-Tyne*. There are also societies of pilots at the larger ports out of those districts, the government in such case being vested in certain officials lawfully appointed as 'patrons and protectors.' Their powers over the members, &c., are defined in the act above quoted, and in the Merchant Shipping Act of 1854, 17 and 18 Vict. c. 104, sections 280-289.

Pilots board vessels entering their districts in boats conspicuously painted, on the bows and ends of which must be the vessel's distinguishing number as shown by his licence. The boat also bears a flag of comparatively large size, of red and white divided horizontally. A ship requiring a pilot hoists a square blue flag. In passing up or down the Thames, every ship above 50 tons or 6 feet draught must have a pilot; but her master or first mate may act by licence in that capacity, if he have passed the necessary examination. A master is subject to a penalty for sailing without a pilot; and, on the other hand, so also is any person, without a licence, or whose licence has been forfeited, presuming to act or offering to act as a pilot.

In the course of wars recruits the pilot is a permanent officer of the ship, and has charge of her course, but his functions in that case approach nearest to those of the British Master (q.v.). Large French vessels have often several sailing pilots called *pilotes hors-bord*, and a *pilote d'atome* or *debarcadere*. The ancient laws of France contained regulations for the education and regulation of both these classes.

The general rule as to the responsibility of the owners of the ship is, that no owner or master of a ship is answerable to any person whatever for any loss or damage, occasioned by the fault or incapacity of any qualified pilot, acting in charge of such ship within any district where the employment of the pilot is compulsory.

PILOT-FISH (*Naucrates ductor*), a fish of the family *Scorpenidae*, and belonging to a section of that family in which the first dorsal fin is represented by seven spines, and there are no finlets behind the second dorsal and the anal fins as in the mackerel, &c. The shape of the P. is very similar to that of the mackerel. It is usually about a foot long; the general colour silvery greyish-blue, five dark blue transverse bands passing round the whole body. Its flesh is very delicate, and resembles mackerel in flavour. It is common in the Mediterranean, and appears to be widely abundant through the warm parts of the ocean, often following ships for a long time and very far, so which way it has been known to come from Alexandria to Plymouth. It is, however, of rare

occurrence even on the southern coast of Britain. It is supposed to be the *Pomphilius* of the ancients, which was believed to point out their desired course to sailors. It is often seen in the company of a shark, and is therefore very commonly supposed to direct the shark to its prey. Concerning this story wonderful stories are to be found in the writings both of voyagers and of naturalists. It has been

Pilot-fish (*Naucrates ductor*).

contended, on the other hand, that the P. merely follows the ship along with the shark for the same object that gulls follow the steamboats on our coasts, to feed on anything outside that may fall or be thrown overboard; so that it attends the shark in order to seize small morsels of its large prey. The following statements of Dr Bennett may be received with confidence: 'I have observed that if several sharks swim together, the pilot-fish are generally absent; whereas, on a solitary shark being seen, it is equally rare to find it unaccompanied by one or more of these reputed guides. . . . The only method by which I could procure this fish was, that when capturing a shark I was aware these faithful little fishes would not forsake him until he was taken on board; therefore by keeping the shark, when hooked, in the water until he was exhausted, or, as the sailors term it, "drowned," the pilot-fish kept close to the surface of the water over the shark, and by the aid of a dipping-net fixed to the end of a long stick I was enabled to secure it with great facility' (*Gatherings of a Naturalist*).—A much larger species of *Naucrates* is found on the coasts of South America.

PILPAL. See BIRPAL.

PILSEN, a town of Bohemia, in a fertile and beautiful valley at the confluence of the Misa and the Raxon, 52 miles west-north-west of Prague. The church of St. Bartholomew (built in 1292), the town-hall, and the house of the Teutonic Knights are interesting Gothic edifices. The town also contains a gymnasium and other educational institutions, an arsenal, theatre, and a number of churches and convents. P. has leather and cloth-factories, a great alum-works, iron and coal mines, and an important brewery. Pop. 11,500.

PIMENTO, PIMENTA, ALLSPICE, or JAMAICA PEPPER, a well-known spice, is the dried fruit of *Eugenia Pimenta* (see *ECUENIA*), a small West Indian tree, which grows to the height of twenty or thirty feet, and has oblong or oval leaves about four inches long, of a deep shining green, and numerous axillary and terminal trichotomous panicles of white flowers, followed by small dark-purple berries. The P. tree is much cultivated in some of the West Indian Islands. It is a very beautiful tree, with straight trunk and much branching head; and about the month of July is covered with an abundance of flowers, which diffuse a rich aromatic odour.

The leaves and bark partake of the aromatic property for which the fruit is valued. The fruit, when ripe, is filled with a sweet pulp, and the aromatic property, which so strongly characterises it in an unripe state, has in a great measure disappeared. The gathering of the berries, therefore, takes place as soon as they have reached their full

Pimento.

size, which is about that of pepper-corns. They are gathered by the hand, and dried in the sun on raised wooden floors, during which process great care is taken, by turning and winnowing, to prevent them from being injured by moisture. Their colour changes in drying, from green to reddish-brown. When dry they are packed in bags for the market. Some planters kiln-dry them.—The name *Allspice* was given to P. from a supposed resemblance in flavour to a mixture of cinnamon, nutmeg, and cloves. P. is much employed in cookery, and is also used in medicine as a carminative and stimulant, to prevent the griping of purgatives, and to disguise the taste of nauseous drugs. It depends for its properties chiefly on a volatile oil, *Oil of P.*, which is obtained from it by distillation with water, and is sometimes used to relieve toothache, and for making the *Spirit of P.* (or of *Allspice*) and *P.* (or *Allspice*) *Water* of the shops.

PIMPERNEL (*Anagallis*), a genus of plants of the natural order *Primulaceæ*, having a wheel-shaped corolla, and the capsule opening by division round the middle. The species are elegant little annual and perennial plants, natives chiefly of temperate climates. The flowers are not large, but very beautiful.—The **SCARLET P.** (*A. arvensis*) is a common plant in Britain, occurring as a weed in fields and gardens; it is common also in most parts of Europe, and in many parts of Asia. The flowers are of a fine scarlet colour, with a purple circle at the eye. There is a common belief in England, mentioned by Lord Bacon, that when this plant opens its flowers in the morning a fine day may be expected; and they certainly close very readily on the approach of rain. They usually open about eight in the morning, and close about noon.—The **BLUE P.** (*A. cærulea*) is far less common in Britain,

but very abundant in some parts of Europe.—The **BOG P.** (*A. tenella*), frequent in bogs in England, but rare in Scotland, is an exquisitely beautiful plant.—Several species are cultivated in our flower-gardens.—Acrid properties prevail in this genus, and *A. arvensis* has been used medicinally in epilepsy, dropsy, and mania.—The name **WATER P.** is given to *Samolus Valerandi*, also called *Brookweed*, another British plant of the same order, with racemes of small white flowers, growing in watery gravelly places. It is supposed to be the *Samolus* which Pliny says the Druids gathered fasting, with the left hand, and without looking at it, ascribing to it magical virtues in the cure and prevention of diseases in cattle. Its geographic distribution extends over almost all the world.

PIN. As a requisite of the toilet, &c., pins were first used in Britain in the latter part of the 15th c.; they were at first made of iron wire, but in 1549 brass ones were imported from France by Catharine Howard, queen of Henry VIII. Several inventions, however, were previously in use for holding together parts of the dress, such as buckles, brooches, laces, clasps, hooks, &c. At first pins were made by filing a point to a proper length of wire, and then twisting a piece of fine wire around the other extremity, or fixing it after twisting, in order to form a knob or head; and ultimately these operations were so skilfully conducted, that a completely round head was made of very small size, and scarcely shewing the nature of its construction. Some pins are still made in this way. It is surprising how many operations are needed to complete so small an article. They are as follows: 1. *Straightening and Cutting the Wire.*—The straightening is necessary, because the wire-drawers coil the wire as they make it upon a cylinder, and when it is unrolled, the coils remain. It is therefore drawn through an arrangement of upright iron rods which completely straighten it, after which it is cut into lengths of 30 feet, and these are again reduced to lengths of four pins. 2. *Pointing.*—This is done by two operations and different workmen, each standing at a separate grindstone; the first is the rough grinder, and the second the finisher. Each holds with the thumb on the palm of the hand a number of the wires amounting to 30 or 40, and by a movement of his thumb he manages to make the wires turn round so as to make a point to each as he holds them to the grindstones, the second of which, being of a fine material, gives them a smooth finish; they are then reversed, and the other end pointed. 3. *Cutting.*—The length of a single pin is cut off of each end of these pieces; the intermediate portions are then handed back to the pointers, and each end receives a point, after which they are divided into two, and thus the four pin piece is reduced into single pin lengths, each having a point. 4. *Twisting the Heads.*—These are made of very thin wire, which is coiled twice, by means of a lathe, around the end of another piece of wire the same thickness as the pins. 5. *Cutting the Heads.*—The head being formed on the thin wire, it is handed to another workman who cuts it off; these two operations are performed with great rapidity, so great, indeed, that as many as 12,000 have been made in an hour. 6. *Annealing the Heads.*—This is softening them by putting some thousands into an iron ladle, and after making them red hot, plunging them into cold water. 7. *Stamping or Shaping the Heads.*—This is pressing the heads into a better shape by means of a small lever press, and at the same time fixing them on the pins; a good worker will do as many as 12,000 to 15,000 per day. 8. *Yellowing or Cleaning the Pins.*—This is done by a process which is often called *souring*; it consists in boiling them for about half an hour in

the dregs of sour beer, or a solution of argol or cream of tartar, and then washing them in clean water. 9. *Whitening or Tinning.*—In this process a large copper pan is used, and in it is first placed a layer of about six pounds of the cleaned or yellowed pins, and over these a layer of grain-tin to the amount of about eight pounds. Several alternate layers of pins and tin are put in one vessel, and then by a pipe arranged inside the copper pan water is gently poured in, and goes through the pipe to the bottom, first rising up through the different layers so gently as not to disturb them. Fire is now applied to the bottom of the pan, and when it is nearly boiling its surface is sprinkled with a quarter of a pound of cream of tartar, and the whole is slowly boiled for half an hour, then poured into a strainer and shaken, to separate the pins from the grain-tin and liquid; by this process a thin deposit of tin has been thrown on the pins, which now are white instead of yellow; without the souring this would not take place, it being essential that they should be quite free from any oxidation or soil. 10. *Washing.*—The pins are now thoroughly washed in pure water. 11. *Drying and Polishing.*—They are now put into a large leathern bag with a quantity of bran, and violently shaken backwards and forwards by two men. 12. *Winnowing.*—The bran is next separated by fanning. 13. *Pricking the Papers to receive the Pins.*—This is now done by an ingenious machine, through which the papers are passed, and which, at regular intervals, arranged according to the size of the pins, pinches up a fold of the paper, and at the same time pricks the holes to receive the pins, and then places the pins in their places. Formerly this required a separate operation. Thus fourteen persons were required to make and put up for sale a pin, and in some manufactories this is still the case; but in all the large establishments machines are now employed, and an immense reduction of hand labour is effected by them.

The first machine was invented by Lemuel Wellman Wright, of the United States, in 1824. This did very little more than make solid heads to the pins, by a process in principle like that used for nail-making—viz., by driving a portion of the pin itself into a counter-sunk hole. The action, however, was automatic, and consisted in an arrangement by which the wire was seized in two small grooved cheeks, as in figs. 1 and 2, which represent them separated. Fig. 1 has the groove empty, but in fig. 2 is seen the wire which projects at *a*. When both cheeks are

placed face to face, and the wire is held tightly in the groove with the small portion (*a*) projecting, a small ram or hammer connected with the machine strikes on *a*, and compresses it into the small cup-shaped depression *b*, and thus the head is formed, as in fig. 3. The pointing and dressing of the pins was afterwards carried on as described

in the processes for hand-made pins. Since Wright's invention many remarkable improvements have been effected in these machines, which have consequently become very complicated in their details, although the principles upon which they act are very simple. No description would convey a satisfactory idea of these wonderful pieces of mechanism, which now, without the aid of hands, complete the pin in all respects except the colouring and polishing; but a slight account of the leading features will enable the reader to understand their mode of working. First, then, a reel of wire as it comes from the wire-drawer is placed in the rear of the machine, and the end of the wire is taken hold of by a pair of nippers, which pull it over a fixed *straightening board*, and pass it on completely straightened, until it is seized by two cheeks similar to those in figs. 1 and 2, when a cutter descends and cuts it off, leaving the projecting part for the head; on the withdrawal of the cutter, the hammer flies forward, and makes the head as before described; the cheeks open, and the pins drop on to a sloping metal plate finely grooved, down which they slip with the heads upwards, until the end which is to be pointed comes in contact with a cylindrical roller with a grinding surface, which soon grinds points upon them, owing to two or three ingenious arrangements: the first is, that the grooved surface of the plate by which the pins descend terminates a little above the grinding roller, then a slight depression is given to the sloping plate and also to the roller, so that one end is an inch or two lower than the other; therefore, as the pin descends the groove (*a*, fig. 4), and is thus brought down the inclined plate until it lies on the smooth part (*b*, fig. 4), where it is highest, and with its end in contact with the grinding roller (*c*) which is revolving, the pin itself is compelled by the friction of the roller to turn round, and gradually descends from the upper to the lower part of the inclined plate (*d*), and then falls off into

Fig. 4.

a box placed to receive it. This is attempted to be shewn in fig. 4. These operations are performed so rapidly that they can scarcely be followed by the eye, and the pins fall into the box beautifully pointed in a complete stream. They are then *yellowed*, *tinned*, and prepared for papering, which is a remarkable process. The machine by which it is done is worked by two children; one feeds the machine with pins, the other with papers. The first part of the machine is a box, about 12 inches

long by 6 inches broad and 4 inches deep; the bottom is made of small square steel bars, sufficiently wide apart to let the shank of the pin fall through but not the head, and they are just as thick as the space between papered pins; the bottom of the box, with the row of pins hanging through it, are seen in fig. 5. The lower part of the bottom of the

Fig. 5.

box at *a* is made to detach itself as soon as the row of pins is complete, and row after row at regular intervals is received and passed down a corresponding set of grooves, until they reach the paper which, as before described, is pinched into regular folds and pierced to receive the pins, which, by the nicest imaginable adjustments, come exactly to their places, and are pressed into them. In this way many thousands of those neat-looking paper packages of pins, with which all are familiar, are put up in one day by two little girls, aided by these wonderful machines.

PINA CLOTH, a very beautiful fabric made of the fibres of the leaves of the pine-apple plant (*Ananassa sativa*), and other allied species. This cloth is only made in Manila, and in its manufacture resembles horse-hair cloth, because the threads both of warp and weft are each single unspun fibres, consequently only small pieces can be made; the workers have, however, a plan of joining the fibres of the coarser kinds end to end, so as to make warp threads of considerable length. Pina cloth is very strong, and the better sorts far excel the finest lawns in texture. It is chiefly employed in the manufacture of ladies' pocket-handkerchiefs, which often have their costliness much increased by beautiful embroidery.

PINCHBECK is an alloy of zinc and copper, in which the proportions slightly differ from those which constitute brass; 3 parts zinc to 16 of copper constitute this material, instead of one part of the former to two of the latter as in common brass. Pinchbeck, when new, has a colour resembling red gold, and it was at the beginning of the present century much employed in making watch-cases and other small articles in imitation of gold.

PIND DADU'N KHAN, a town in the Punjab, stands on a narrow verdant plain on the right bank of the Jhelum, and at the southern base of the Salt Range or Kalabagh Mountains, 110 miles north-west of Lahore. The town consists of three groups of houses, four miles from the Jhelum. The houses are built of mud, but the framework is of cedar-wood. In the vicinity, salt is extensively raised in the Salt Range. See PUNJAB. Entire population, 13,588.

PINDAR (Gr. *Pindaros*), the great lyric poet of Greece, was born, about 522 B.C., of a noble family of Thebes, at Cynoscephalæ, a village in that territory. His genius for music was hereditary, and at an early age he was sent by his father, himself a flutist, to receive instruction in the same art from Scopelinius. At this time his genius for poetry too—foreshadowed, according to later writers, by a swarm of bees miraculously resting on his lips when asleep—began to develop itself, and so he went to Athens to be placed under the tuition of Lasus of Hermione, the founder of the Athenian school of dithyrambic poetry. Before completing his 20th year he returned to Thebes, where he continued to pursue his studies under Myrtis and Corinna, of Tanagra, two poetesses then famous in Boeotia. With both of his instructresses he contested the prize for music at Thebes, but was five times defeated by Corinna. He was still a young man when he entered on his professional career as a poet, and his services soon came to be in great request on festive occasions throughout all the Hellenic states. He composed choral songs for Hiero, tyrant of Syracuse; Alexander, son of Amyntas, king of Macedonia; Theron, tyrant of Agrigentum; Arcesilaus, king of Cyrene; and also for many free states and private individuals. He won not only the admiration of his employers for his lyrical genius, but also their respect for his independent character, which, amid all the presents and rewards conferred upon him, never degenerated into that of the poet who merely performed for hire. He was especially the favourite of Alexander, king of Macedonia, and of Hiero, tyrant of Syracuse; and it is said that to the praises he lavished on the former of these monarchs his house owed its preservation at the hands of Alexander the Great, when he reduced the rest of Thebes to ruins. His life was for the most part spent abroad at the courts of kings, and at the scenes of the great public games; and at one period, 473 B.C., he resided at Syracuse at the court of Hiero for the space of four years. He died most probably in 442 B.C., in his 80th year. Of the immense number of his poems, consisting of hymns to the gods, peans, dithyrambs, odes for processions (*prosodia*), maidens' songs (*partheneia*), mimic dancing songs (*hyporchemata*), convivial songs (*scolia*), dirges (*threnoi*), and encomia on princes, we only possess fragments. His *Epinikia*, or Triumphal Odes, however, have come down to us entire; and it is from these—divided into four books, and celebrating the victories won in the Olympian, Pythian, Nemean, and Isthmian games respectively—that we must form an opinion of P. as a poet. A victory at these games conferred honour not upon the winner and his family only, but also on the city to which he belonged; and for its celebration—which began with a procession to the temple, where sacrifice was offered, and ended with a convivial banquet—a poem was specially composed, and was sung by a chorus either during the procession, or, more frequently, at the banquet (*comus*). P.'s poetical style is peculiar. Full of bold conceptions and striking metaphors, his manner is so rapid and so subject to abrupt transitions, as to render him not only a difficult but an obscure composer. Typical examples of his strength, as well as of his weakness, will be found in the Second Olympian and First Pythian Odes, where the description of the Islands of the Blessed in the former, and of an eruption of Mount Ætna in the latter, are brilliant offsets to the shadowy mythological allusion and the undeveloped metaphor which also characterise them. His metres, in spite of the able efforts of Böckh, still remain to be satisfactorily elucidated; and all that we can

one way of them is, that he makes almost none of the former, yet that, and not infrequently of the latter, of Lydon. He has been fortunate neither in his numerous imitations nor translations. Gray being, perhaps, the most successful among the former; of Gray and Alfordian Moore among the latter. It has been ably explained and criticised, a valuable *Pindar's Iambi and Epigrams* (Bonn, 1845), while his relation to lyric poetry in general was also subject of Villmann's brilliant *Stimmen aus dem Pindarischen oder die Pindarische Lyrik* (Paris, 1850). The best editions are those of Boeckh, of Bonn, re-edited by Schneidewin; and of Hartung.

PINDAR, Pindus. See WALLACE.

PINDUS, originally the name of a chain of mountains in Greece (q. v.).

PINE (*Pinus*), a genus of trees of the natural order *Coniferae*. The European genus includes all sorts of Fir, Larch, and Umbel; but as now limited, no genus *Pinus* is distinguished by numerous cones, and woody stems with numerous two-ranked spines, the scales having an angular truncated apex, the leaves are linear and very narrow, of a very silvery green colour, growing in clusters or in pairs, or surrounded by scaly bracts at the base. To its genus belong many noble and useful trees, but usually grow in mountainous or rather exposed positions, and their narrow leaves are admirably fitted to resist the force of winds, which produce at the top of pines a peculiar sound, much noticed by the Arabians; some soft and continuous than almost all other foliage. Most of the pines are evergreen, and, one kind often covering a considerable tract; some of them clothing the sides and on the summits of mountains with magnificent or smaller forests; some growing in lower lands, and on extensive unproductive sandy grounds, as in *Pinus* *maritima* at North America. The pines growing in the most barren soils, or in the coldest moist and most exposed situations are often very soft; and although very unlike any other shrubs or trees, are usually to be called trees. Pines are widely diffused over the northern hemisphere, and found on mountainous tracts and near the ocean, and in the colder temperate and the arctic zones descending to the level of the sea.

The *Scotch P.* or *Scotch Spruce* (*P. sylvestris*) is the only species indigenous to Britain. It has some in pairs, about as high and a half long; the rest about the same length, often, and with rounded scales. On very poor soils and at great distances it is reduced to a kind of shrub, but in favourable situations it becomes a lofty tree. A half tree high and a half in diameter has been obtained from a *Scotch Spruce*. The *Scotch P.* is a quick grower, but has been known to attain to over 100 years. Its trunk is somewhat round or rounded; and the lower branches die off as the tree grows, leaving the older trees bare of needles for the greater part of their height; but the more sap to send off large branches than most of the *Conifers*. There are still native forests of *Scotch P.* at Brecon and elsewhere in the Highlands of Scotland; and even in the south of Scotland golden trees are to be seen which, probably, are now planted by man. The *Scotch P.* is not indigenous to the south of England, but having been introduced, is spreading rapidly and spontaneously, along with the *Pinaster*, in some of the heaths and other mountain tracts. Immense forests of it exist in some countries of Europe, in some of which it is mingled with the *Juniper*. In the middle and south of Russia and of Asia, it is found even in places near the level of the sea, especially where there is a mountain nearby; in the south of Europe

it grows only on mountains. Its timber is highly valuable, being very strong and durable, and is the *best kind of Red Pine* used in houses and ship-building. There is very great difference, however, in the timber of *Scotch P.* growing in different soils and situations, rich soils and sheltered situations being favourable to the quality of the timber, which becomes white, soft, and supple, slightly warbly; and there exist several varieties of *Scotch P.*, some of which yield timber very superior to others. Many plantations in Britain have, unfortunately, been made of inferior kinds. One of the best varieties is that which forms the southern Russian *Pinus*, often designated *Brecon*

Scotch Pine.

P. by nurembergensis. It is remarkable for its very horizontal branches, and is therefore sometimes called *P. horizontalis*.—The *Scotch P.* is not only valuable for its timber, which is available for some purpose at every stage of its growth, but on account of other products. Common Turpentine is in great part obtained from it, and much Tar, Pitch, Resin, and Lamp-black. See those heads. Oil of Turpentine is sometimes distilled from the cones, and even from the leaves; the leaves have also been used in Germany for the manufacture of a substance resembling wax, and called *Waldwachs* (Forest Wax), suitable for stuffing cushions, &c. The resinous matter is dug out of the ground in many parts of the Highlands of Scotland, and being divided into small splinters, are used to give light in cottages instead of candles. Fishwives, in some places, make ropes of the inner bark, which is applied to a very different use, when most soft and succulent in spring by the *Kamtschatsches* and *Lapplanders*, being dried, ground, steeped in water to remove the resinous taste, and used for making a coarse kind of cord. The *Drum P.* (*P. flexilis* or *P. Muehlenbergii*) is found in the Alps and Pyrenees, its trunk often lying on the ground, although sometimes it appears as a bush or low tree. The resinous trunks are called *Kramersholz* (Broken wood) and *Kramholz* (Knee wood) by the Germans.—The leaves are in pairs, very like those of the *Scotch P.*, but a little longer; the cones are also similar. From the young shoots an oil resembling oil of turpentine is obtained

PINE

by distillation, which is a kind of universal medicine among the peasantry of Hungary, as is also the resin spontaneously exuding from the tree, which is known as *Hungarian Balsam*.—The **BLACK P.**, or **BLACK FIR** (*P. nigricans*, or *P. Austriaca*), is another species closely allied to the Scotch P., but remarkable for its very long leaves. It is a native of Austria. It abounds in resin more than any other European tree.—To the same group of pines belongs the **SEASIDE** or **TAURIAN P.** (*P. Pallasiana*, *maritima*, or *Taurica*), which also affords resin in great quantity, and of a very pleasant odour. It is found in many parts of the south of Europe. Its timber is of little value; but great part of the turpentine of the *Laules* and other maritime districts of France is obtained from it. It yields also part of the *Burgundy Pitch* of the apothecaries' shops.—The **ALEPPO P.** (*P. Halepensis*), a native of the south of Europe, Syria, &c., is a very graceful tree of moderate size, with leaves in pairs and slender. It yields a liquid resin or turpentine, which is extracted from it in Provence and elsewhere, and sold as *Venice Turpentine*. The wood is extensively used in the Levant for shipbuilding.—The **LARICIO** (*P. Laricio*) has leaves in pairs, lax, and 4–8 inches long, cones 2–4 inches long, with the scales slightly pointed. It is often called the **CORSICAN PINE**. It grows on the shores of the Mediterranean Sea, and is valuable both for its timber and for its resinous products. In the island of Corsica, it frequently attains the height of 140 feet. It grows well in sandy soils, and has been made particularly useful for preventing the drifting of the sand, and turning to account the otherwise useless tracts between the mouths of the Garonne and the Adour in France, thus also preserving valuable lands which the sand threatened to overwhelm.—The **PINASTER** or **CLUSTER PINE** (*P. Pinaster*) is another of the most important European species. It has cones in whorls of 3, 4, or even 8 together, 4–6 inches long, leaves in pairs, and very long. It is found on the shores of the Mediterranean, and also in the Himalaya and in China. It has been used in France to a great extent, in the same way as the Laricio, for covering waste sandy tracts. The timber is of inferior quality, but great quantities of resin are procured from it. It yields *Bordeaux Turpentine*.—The **PYRENEAN P.** (*P. Pyrenaica*) is a majestic tree, a native of the Pyrenees, and producing very fine timber.—The **CALABRIAN P.** (*P. Brutia*) somewhat resembles the Pinaster.—The **STONE P.** (*P. pinea*) a tree with a broad umbrella-shaped head, a form often seen also in the Scotch fir, forms a characteristic feature of the scenery of the Mediterranean, and is very often introduced in paintings. It is the *Pinie* of the Germans, the *Pignon* of the French. The leaves are in pairs, 4–5 inches long; the cones very large, ovate, and obtuse. The seeds, which do not ripen till the fourth year, are large, abound in a fixed oil, and when fresh, have a sweet taste resembling that of almonds. They are used in Italy and other countries in the same way as almonds and pistachio nuts for the dessert, in various dishes, also in emulsions, &c., under the names of *pinies*, *pinioles*, and *pignons*. The use of them, however, is almost entirely confined to the countries in which they are produced, as they very soon become rancid. They are sometimes imported into London in the cone, in which way they can be kept longer, but the cost of importation is much increased. The wood of this tree is very useful and beautiful. It yields resinous products only in small quantity.—The **CEMBRA P.**, or **SWISS STONE P.**, which grows in the central parts of Europe and the south of Siberia—a stately tree, with the lower branches more persistent than they

are in most pines, and rigid leaves in groups of three to five—also produces eatable seeds (*Cembra Nuts*), which, although they are extracted with difficulty,

Stone Pine (*P. Pinea*).

are much used. The cuticle contains a resinous juice; but in Siberia, this fruit is so much prized that noble trees are often cut down to obtain it. The Cembra P. yields a pellucid, whitish oil, resembling oil of turpentine, and known as *Caryophyllus Balsam*.

North America produces many species of *P.*, some of them very beautiful and very valuable. Besides those long known, and which are found in the states and colonies near the Atlantic, a number of the noblest species of this genus have, since the commencement of the present century, been discovered in California and the north-western parts of America.—The **RED CANADIAN P.** (*P. resinosa*) is found from Canada to the Pacific, but does not reach far south in the United States. It is the **YELLOW P.** of Canada and Nova Scotia. It delights in dry and sandy soils, and attains a height of 70–80 feet, with a diameter of two feet at the base, the trunk continuing of uniform diameter for two-thirds of its length. The leaves are in pairs and are congregated towards the extremities of the branches. The timber is highly esteemed for strength and durability, and furnishes excellent planks for ship-building. It is also used for masts. Somewhat resembling this in botanical characters, is the **SCRUB P.**, or **GRAY P.** (*P. Banksiana*), generally only 3–10 feet high, which begins to appear in the northern parts of the United States upon high mountains, and is interesting as an arctic species extending further north than any other.—The **YELLOW P.** (*P. variabilis*, or *P. mitis*) abounds in the Atlantic States from New Jersey to Virginia. It is a tree of 50–60 feet high, 15–18 inches in diameter at the base, with leaves 4–5 inches long, usually in pairs, but sometimes in threes upon the younger shoots. The timber is very extensively used for ship-building, and is largely exported to Great Britain. At Liverpool, it is known as **NEW YORK PINE**.—The **JERSEY P.**, or **SCRUB P.** (*P. niope*), abounds in the lower parts of New Jersey, and thence to the south-west. Its leaves are in pairs, 1–2 inches long, the cones armed with strong spines. The tree is rarely 30 or

80 feet high. Great quantities of it are made from it in Kentucky.—The *Prince P.* (*P. rigida*) is a native of the northern and middle parts of the United States, often growing to great size, straight, and attaining a height of 70–80 feet, and a diameter of two feet at the base. The leaves are in threes, varying much in length, as the cones do in size. Immense quantities of it are used for fuel. The best lamp-black are sometimes made from it.—The *Larix* or *Old Pine* (*P. 3P.*) *Pinus strobus* is dry and sandy soils in the lower part of the Southern States, often occupying lands so forested by cultivation. Next to the most cultivated, in the Southern States, are *Pin. Borealis*, in great part covered with this species of pine. It attains a height of 30 feet and upwards, and has a wide spreading crown. The leaves are 6 inches long, in dense sometimes in four or young branches, the cones four inches high, with strong spines. The timber is of much value.—The *Lambertian P.*, or *Longleaf P.* (*P. palustris*, or *P. distachya*) is perhaps the most important of North American forest trees. It furnishes the greater part of the tar, resin, pitch, and turpentine used in the United States. The timber is also very valuable, and is much used for ship-building. In England and the West Indies it is known as *Gumera*, *Princ Pine*. The tree attains a height of 60–70 feet, and a diameter of about 10–15 inches; the leaves are in threes, and about a foot long; the cones 7–8 inches long, and 4 inches in diameter, with small spines. The seeds are sometimes eaten.—The *Weymouth P.*, or *White P.* (*P. strobus*), attains a height of 150 feet, and a diameter of 6 feet and upwards. It has the sub-triangular leaves in groups of five, and sometimes cones 4–6 inches long, with thin smooth scales. It is frequently planted in Britain and on the continent of Europe as a beauty. In its native country, it abounds mostly from lat. 42° to lat. 47°, and southward to the Alleghenies. The timber is not strong, but easily wrought and durable.—Of the species

attained a height of 150–200 feet, and a diameter of 7 feet and upwards, almost to 30 feet. The trunk is remarkably straight, and destitute of branches for two-thirds of its height; the leaves ordered, the cones upwards of a foot long. The timber is white, soft, and light; and the tree produces great quantities of a pure uncoloured resin, which, when the wood is partly burned, is changed into a somewhat resinous substance, used by the natives as a substitute for sugar. The seeds are often either roasted or pounded into sweet cakes.—*P. Borealis* is found on the Rocky Mountains, near the head waters of the Arkansas, and grows almost to the limit of perpetual snow. It has a dense crown, formed of numerous and remarkably flexible branches. The leaves are in fives. The seeds are used as food by Indians and Indians. *P. ponderosa*, another native of the Rocky Mountains is a magnificent tree, remarkable for the heaviness of its timber, which almost sinks in water. The leaves are in threes, and 14 inches long. *P. Nelsoniana*, *P. Coulteri*, and *P. insignis* are also native species from the west of North America. The Himalaya Mountains abound in pines, some of which rival in magnificence those of North-west America. The *Burra P.* (*P. cuneata*), much resembling the Weymouth P. in its laminated character, and attaining a height of 100–150 feet, abounds in Hindostan, although it is not found in the neighbouring countries of Sikkim and Nepal. The wood is richly yellowish, heavy, durable, close-grained, and so numerous as to be used for flamboy and sandal.—The *Larix P.* (*P. longifolia*) of India is a tree of remarkable and more graceful appearance; with leaves in threes very long, very slender, and generally pendulous. It is abundant on the coast of Malabar to the lower Himalaya, growing at a lower elevation than the other pines. It is cultivated in some parts of India as an ornamental tree. It is much valued for its resin. The wood is used in India as a substitute for European deal.—The *Khasia P.* (*P. A. hasoria*) is peculiar to the Khasia Mountains, and has very much the general appearance of the Scotch pine.—*P. Himalayana*, a species with leaves in threes, is a large tree, a native of Nepal. The seeds are edible. The mountains of India and the north-western parts of America produce numerous other species. Mexico has a number of very fine ones peculiar to itself; the mountains of St Domingo have one; the Canary Islands have one; China and Japan also have some. Most of those which have been named, and a number of others, are now ready to be procured in numbers in Britain, although some of them only at prices which prevent any attempt at extensive plantation. Some wealthy noblemen and gentlemen devote a portion of their grounds to a collection of different kinds of *P.*, called a *Pinetum*. A few foreign species have become pretty common in plantations. Most of the pines are quite hardy in Britain, but this is not the case with the *Chama P.* and some of the Mexican species. The name *P.* is often popularly extended, and even in scientific works, to other *Coniferae*.

Five-pines.—This term is in general use for the timber of the pine-tree (see *Coniferae*), and is not confined to that of the genus *Pinus*, but embraces the wood of species of *Abies*, *Larix*, *Taxus*, *Juniperus*, &c. From the Baltic parts we receive red and white pine, or deal-timber. The former is yielded by the Scotch Fir (*Pinus sylvestris*), and the latter by the Spruce Fir (*Abies conica*). These two, with the Larch (*Larix Europæa*), yield the greatest part of the pine-timber of Europe; and of these, the imports into Britain from the north of Europe for the year 1862 were 59,000,000

Lambert's Pine (*P. Lambertiana*).

belonging to the north-western parts of America. One of the most magnificent is *P. Lambertiana*, which is found on the Rocky Mountains, between lat. 40° and lat. 44°, chiefly in sandy soils. It

PINEAL BODY—PINE-APPLE

cubic feet. Next in importance to these is the pine-timber of the British North American colonies, which is chiefly yielded by the Weymouth Pine (*Pinus Strobus*), although, doubtless, the wood of other coniferous trees is often substituted for it. The celebrated pitch-pine of Savannah, in the Southern States, is the produce of *Pinus rigida*. It is much used for ships' masts and yards, and for all purposes requiring great strength and durability, in both of which qualities it excels most others of its kind. The American war has, for the last three years, cut off the supply of this useful timber; but from her colonies in North America Great Britain imported, in 1862, upwards of 55,000,000 cubic feet of other kinds of pine timber. The kinds above mentioned are those which constitute the greater part of the pine-timber used in ship and house-building, carpentry, &c., in Great Britain. In France, the timber of the Corsican Pine (*Pinus Laricio*) and the Seaside Pine (*Pinus pinaster*) are greatly used. In Italy, the pine-timber is chiefly yielded by the Stone Pine (*P. pinea*) and the Calabrian Pine (*P. Bruttia*); that of Spain is from the Pyrenean Pine (*P. Pyrenaica*). In Germany, and especially in Austria, the Black Pine (*P. Austriaca*) furnishes the greater portion; but the fine-grained, soft white pine, or deal, so much used for sounding-boards of musical instruments, is the wood of the Silver Fir. See FIR. The trade in this timber is very great, for not only do the Germans use it almost exclusively in their vast toy-manufactories and for lucifer-matches, but considerable quantities are exported. The finest is cut in the forests of Bohemia, where large establishments are formed for dressing and preparing the wood for various purposes.

The timber of the Norfolk Island Pine (*Araucaria excelsa*) is sometimes imported for making ships' masts, as several other kinds of pine-timber are imported from time to time, but those mentioned form the great staples of the timber-trade. The chief value of this class of timber-woods is in the combination of lightness and strength with softness of texture and ease in working with ordinary tools; they constitute, in fact, the principal materials of our builders, and are more used than all other kinds of wood together. Much confusion prevails as to their common designations, for in this country alone, *fir*, *pine*, and *deal* are terms applied to all and each of them, according to the caprice of the individual. The two first names are used because the material is derived from one or other of those genera; but the last is a misnomer altogether, as the term *deal* belongs only to pieces of fir or pine timber cut to particular sizes: they are three inches in thickness, nine inches broad, and of variable length; if of less width, they are called *battens*.

PINEAL BODY, is a small reddish-gray body, of a conical form, and deriving its name from its resemblance to the fruit of the pine. It rests upon the corpora quadrigemina of the brain, in front of the cerebellum. It is about four lines in length, and from two to three in width at its base. It is larger in the child than in the adult, and in the female than in the male. It consists chiefly of gray matter, and in its base is a small cavity, which contains a transparent viscid fluid, in which are granules composed chiefly of phosphate and carbonate of lime, and termed *acervulus cerebri*. This organ was regarded by the ancients as the seat of the soul.

PINE-APPLE, or **ANANAS** (*Ananassa sativa*) a plant of the natural order *Bromeliaceæ*, highly esteemed, and much cultivated for its fruit. The

fruit is a *sorosis*, formed by the calyces and bracts of a close spike of flowers, becoming succulent and combined. This is the distinctive character of the genus *Ananassa*. The P. has a number of long, serrated, sharp-pointed, rigid leaves, springing from the root, in the midst of which a short flower-stem is thrown up, bearing a single spike of flowers, and therefore a single fruit. From the summit of the fruit springs a crown or tuft of small leaves, capable of becoming a new plant, and very generally used by gardeners for planting; the P., in cultivation, being propagated entirely by crowns and suckers, as, in a state of high cultivation, perfect seed is almost never produced. The P. is a native of tropical America; it is found wild in sandy maritime districts in the north-east of South America, but it has been very much changed by cultivation. It has also been gradually diffused over tropical and subtropical countries, and not only as a cultivated plant, for it is fully naturalised in many parts both of Asia and Africa. It delights in a moist climate, and consequently does not succeed well in the dry climate of the south of Italy, although the warmth is sufficient. The first particular account of the P. was given by Oviedo in 1535. It was in Holland that it first began to be cultivated in hot-houses; but it was introduced into England in the end of the 17th c., and its cultivation rapidly became general in the gardens of the wealthy. It is only since the peace of 1815 that it has received similar attention in continental Europe. Great care is requisite in the cultivation of the P., which, without it, is generally fibrous and coarse, with little sweetness or flavour; and with it, one of the most delicate and richly flavoured of fruits. Its size also very much depends on cultivation. The size varies from 2½ lbs. to 12 lbs. in weight. The pine-apples grown in British hot-houses are generally much superior to those of the West Indies, because the latter grow almost or altogether without cultivation; but the importation of pine-apples from the West Indies having now been carried on to a considerable extent, and promising to add to the sources of wealth for these colonies, has led to greater care in cultivation there, and consequent improvement of quality.

In the cultivation of the P. in Britain, a tropical heat must always be maintained. It is generally cultivated in hot-houses specially appropriated to it, called *Pineries* or *Pine-stoves*; sometimes also in flued pits; and sometimes even without fire-heat, in frames continually supplied with fresh tanners' bark and dung. The universal practice, till of late, was to grow the plants in pots, plunged to the requisite depth in tanners' bark or other fermenting matter, and these were transferred from one house or one compartment to another, according to their stage of advancement; three years' culture being deemed requisite for the planting of a crown or sucker to the production of the ripe fruit; but the P. is now often planted in beds, and fruit of the best quality is sometimes obtained in fifteen months. The best soil is a rich and rather sandy loam. It is often formed from the turf of old pastures, with dung, peat, sand, &c., thoroughly mixed. Ventilation must be freely allowed from time to time, but care must be taken to keep the atmosphere moist. A P. which has borne fruit is thrown away as useless.

There are many varieties of the P. in cultivation. Of these, some are referred by some botanists to distinct species. But the greater number of varieties are universally referred to *A. sativa*, and differ in the more or less spiny serratures of the leaves, the globular, cylindrical, or pyramidal fruit, its size, &c.

A voracious leaper (*Pteropoda Ross*) is much found on the P. in some warm countries.

The use of the Hops of the P. is noticed in the article HOPS.

PINE-CHAFER, or PINE-BEETLE (*Hypocypus piceivorus*), a small coleopterous insect of the family *Chrysomelæ*. See **DAVE-BEETLE**. It is often very destructive to Scotch firs in rich soils and low situations, attacking the younger terminal shoot in summer, and soon eating its way into the heart, which it proceeds to excavate so as to convert the shoot into a tube. Pines growing in open situations are little liable to the attacks of this insect; and when of thirty feet in height, or upwards, are very rarely attacked. The insect is about the size of a weevil of the British fir, and of a black or dark drab colour.

PINE-FINCH, or PINE-GROBBER (*Carpodacus*), a kind of bird of the family *Troglodytes*, mostly affixed to Hollands and Greenland, the last nearly resembling that of the former, but the former very similar to the tongue of the crossbill, with the same peculiar form articulated to the rigid bone. See **CROSSBILL**. One species, the *Carpodacus P. (P. hibernicus)*, is a very rare visitant of Britain, but is abundant in many of the northern parts of Europe, Asia, and America. It is larger than a lark, but much resembles the lark in form, shape, tail, &c. The general colour of the male is red. This bird frequents pine forests, and sometimes in flocks in winter. It is easily tamed. Its song is soft and full.—There are other species in the northern parts of the tree. The name P. is given in North America to a very different and much smaller bird (*Chondestes pinus*).

PINEL, PINIER, a celebrated French physician, was born 29th April 1730, at Saint-Ardre, in the Department of Yvon, France; and after receiving a good classical education at the college of Laon, removed to Toulouse, where he studied medicine, and took his degree in 1772. His continued his medical studies at Montpellier, maintaining himself meantime by teaching mathematics; and in 1778 removed to Paris, where he acquired some reputation by a translation into French of Cullen's *Doctrine* (1780), and the works of Haller (1789), and also by some *Mémoires* on subjects connected with botany and comparative anatomy. Having applied himself with assiduity to the study of medical literature, he was charged, in 1791, to make a report on the means intended of the Nation, became chief physician of the institution in 1793, and in 1792 was chosen to the same office at the Salpêtrière (a similar asylum, but for females). In the latter institution, P. commenced a class of clinical medicine, which he continued after his appointment to the Chair of Medical Physics and Hygiene, and subsequently that of Pathology, at the School of Medicine in Paris. He was admitted as a member of the Institute in 1803, and died at Paris, 25th October 1802. His most valuable works were his *Traité de Médecine Théorique* & *Pratique* (1791), and his *Nomenclature Philosophique* (1795), with its commentary, *La Médecine Clinique* (1802). P. joined to himself varying fame by his reformation of the old barbarous methods of treating the insane. The physicians brought up under the old system were not advanced in view a vigorous opposition to P.'s philanthropic opinions; but he fortunately succeeded in ultimately establishing his correctness, and his system in a few years prevailed over the whole of Europe.

PINEROLO, or PINEROL, a town in the south of Italy, in the Chiavari, at the entrance of the valley of Poeno, in the province of Turin, and 23

miles by railway southwest of the city of that name. It was formerly strongly fortified, and was the residence of the rulers of Piedmont. It contains a new cathedral, a bishop's palace, numerous barracks, &c. The ruins of the citadel, for some time the prison of the *Misérables* (see *Nov. 1848*), are still to be seen on the hill of St. Eugenio. Wool-cloth, paper, leather, iron, and silk, are manufactured. Pop. 14,000.

PINE-WOOL. Several attempts have been made of late years to utilize the leaves of pine and fir-trees, which are cut down in vast numbers for their timber only. The leaves contain a considerable quantity of the vegetable fibre, which, when separated, has much the appearance of cotton. In Germany, several works have been established for preparing this fibre, and fitting it for various applications; and under the name of pine-wool, it is now sold for spinning muslins, making wadding, &c. The principal manufacture is near Dresden in Silesia, where it is carried on by the merchant, Herr Hammer.

PINEY TREE. See **CARYOPHYLLUM**.

PINEY-VARNISH. See **DAMPEN**.

PINGPONG. See **RECREATION**.

PINGPONG, On, or. See **PAVANE NINE**.

PINK (*Dianthus*), a genus of plants of the natural order *Caryophyllaceæ*, of which there are many species, annual and perennial, with beautiful and often fragrant flowers, chiefly natives of Europe and the temperate parts of Asia. The leaves are opposite, A corolla, with two to five lobes at the base; there are five petals usually contracted at the throat of the corolla into a linear claw. There are ten stamens, and one pistil with two styles. The capsule is cylindrical and uncelled. The numerous beauty of the flowers has attracted admiration in all ages; and some of the species have long been much cultivated in gardens, particularly the *DIANTHUS P.* and *CARYOPHYLLUM* in v., which are often referred to one—original, the *Carya P.* (*D. caryophyllus*), a native of the south of Europe, growing wild on rocks and old walls, and naturalized in some places in the south of England; whilst some botanists refer the garden pinks in part to the *DIANTHUS P.* (*D. deltoides*), a pretty common British species, and those called *Thousand-eye pinks* to the *DIANTHUS P.* (*D. plumosus*), a native of some parts of continental Europe, differing from the *Carya P.* chiefly in having the leaves rough on the margin, and the petals bearded and much cut. Nearly allied to them is *D. barbatus*, found in moist places in some parts of Europe, and not infrequently to be seen in flower-borders. It has very fragrant flowers. All the varieties of *DIANTHUS P.* mentioned here, have been much changed by cultivation, and careful cultivation is requisite to preserve them in perfection. Both single and double pinks are generally propagated by *cuttings*, which are short cuttings of the younger shoots. They are also sometimes propagated by layers. A full young soil is the best for pinks. The *Clive P.*, in a wild state, has blood-coloured flowers. The leaves are linear and shaped, grooved, and glaucous. The *Maiden P.* is a small much branched plant growing in grassy places, on gravelly and sandy soils; it has rose-coloured flowers spotted with white, and a white eye encircled by a deep purple ring.—The *Heath P.* (*D. alpinus*) and the *Clive P.*, or *Clive P.* (*D. plumosus*), also natives of England, differ from those in being annuals and in having clustered flowers.—The *DIANTHUS P.*, or *DIANTHUS P.* (*D. barbatus*), a native of the middle of Europe and the south of France, with lanceolate leaves, broad

crowded in dense clusters at the top of the stem, acuminate bracts, and bearded petals, has long been a favourite garden-flower, still retaining its place alike in palace and cottage gardens. Although perennial, it is sown annually by florists, to secure fine flowers, and there are many varieties, single and double, exhibiting much diversity of colour.—The INDIAN P. or CHINA P. (*D. Chinensis*) is now also common in flower-gardens.

The Clove P. was formerly regarded as possessing medicinal properties, and was used in nervous maladies.—*Sea P.* is a common name of Thrift (*q. v.*).

PINK COLOURS, very light shades of rose-red colour: they are usually produced by extreme dilution of cochineal or carmine, Brazil and Braziletto wood colours, with whiting. Some mineral pinks for oil colours are obtained from preparations of manganese, &c. See RED COLOURS. The term pink is also applied to several Yellow Colours (*q. v.*).

PINKERTON, JOHN, an industrious and learned *littérateur*, was born at Edinburgh, 17th February 1758, and educated at the grammar-school of Lanark, where he was noted for the unusual excellence of his classical attainments, and for his hypochondriacal tendency. He was afterwards apprenticed to a Writer to the Signet, his father refusing to let him proceed to the university; and while engaged in the irksome and distasteful practice of law, he published an *Ode to Craigmillar Castle* in 1776, which he dedicated to Dr Beattie. In 1780, he went to London, where he settled as a man of letters. Next year, he gave to the public a volume of *Rimes* (as he called his pieces), and a collection of *Scottish Tragic Ballads*, followed in 1783 by a second collection of *Ballads of the Comic Kind*—both of which subsequently appeared under the title of *Select Scottish Ballads*. They professed to be ancient, but many of them were really compositions—*forgeries*, some might say, of P.'s own, and would hardly deceive a critical archæologist. In 1781, he published an *Essay on Medals*, which went through several editions, and long held a high place among books on numismatics; and in 1785, *Letters on Literature*, marked chiefly by a novel system of orthography (e. g., the use of *a* instead of *e* in forming plurals), intended to soften the harshness of the English language, and which was abused as heartily as it deserved. These *Letters* were, however, the means of introducing him to Walpole, through whom he became acquainted with Gibbon and other literary celebrities. P.'s next publication was a most valuable one, *Ancient Scottish Poems never before in Print, from the MS. Collections of Sir Richard Maitland of Lethington, Knight* (2 vols. Lond. 1786). It was followed in 1787 by his once notable *Dissertation on the Origin and Progress of the Scythians or Goths*, in which, for the first time, appears that grotesquely virulent hatred of the Britanno-Celtic race—Scotch Highlanders, Welsh, and Irish—that reaches its climax in his *Inquiry into the History of Scotland preceding the Reign of Malcolm III.* (2 vols. Lond. 1790), where he affirms again and again, obviously with the extremest gusto, that the Highlanders are 'mere savages, but one degree above brutes;' that they are just as they were 'in the days of Julius Cæsar;' that 'like Indians and Negroes,' they 'will ever continue absolute savages,' and that 'all we can do is to plant colonies among them, and by this, and encouraging their emigration, try to get rid of them.' But in spite of this extravagant truculence of speech, the *Inquiry* contains a great deal of important matter—rare and curious historical documents, some of which are to be found nowhere else in print. P. left

England in 1802, and fixed his residence at Paris, where he died 10th March 1826, after a life of hard literary work. His principal publications, besides those already mentioned, are, *The Modern History of England to the Revolution* (1790); *Scottish Poems* (3 vols. 1792), reprinted from scarce editions; *Iconographia Scotica, or Portraits of Illustrious Persons of Scotland, with Biographical Notes* (2 vols. 1795—1797); *The History of Scotland from the Accession of the House of Stuart to that of Mary* (2 vols. 1797), valuable for its laborious investigation of original materials, but disfigured, in a literary point of view, by an imitation of the grandiose style of Gibbon; *Walpoliana*, a collection of his notes of his friend Horace Walpole's conversation, in 2 vols.; *The Scottish Gallery, or Portraits of Eminent Persons of Scotland, with their Characters* (1799); *Modern Geography* (3 vols. 1802—1807); *General Collection of Voyages and Travels* (16 vols. 1808—1813); *New Modern Atlas* (1809—1815); and *Petrælogy, or a Treatise on Rocks* (2 vols. 1811).

PINK ROOT. See SPIGELIA.

PINNNA, a genus of lamellibranchiate molluscs of the same family with the *Pearl Mussel* (*Avicula*), and having a shell of two equal wedge-shaped valves, closely united by a ligament along one of their sides. The mantle is closed on the side of the ligament; the foot is small and conical. The byssus is remarkably long and silky; and by it the species affix themselves to submarine rocks and other bodies, sometimes even to sandy or muddy bottoms. The best known species is *P. nobilis*, a native of the Mediterranean, the byssus of which was used by the ancients for fabrics, but chiefly as an article of curiosity, to which a great value was attached. It is still so used in Sicily and elsewhere. It is very strong and lustrous. The only reason against its more general use is the difficulty of procuring it in sufficient quantity. The byssus of this species is sometimes two feet long, the shell is about the same length. Pinnæ are often found in large beds, with only the edges of their shells appearing above the mud or sand. The animal is eaten.

PINNACE (from the Ital. *pinaccia*, a diminutive of *pino*, a ship) was originally a small vessel, usually schooner-rigged, employed as tender to a large ship, for the purpose of communicating with the shore, &c. At present, however, the signification is limited to a large boat carried by great ships. It is smaller than the launch, but larger than the cutters; and is generally rowed 'double-banked,' by from ten to sixteen oars.

PINNACLE, an ornamental termination much used in Gothic architecture. It is of simple form in the earlier periods of the style, having a plain square or octagonal shaft and sloping roof or top, terminating with a finial; but in later examples the pinnacle is greatly developed, and becomes one of the most varied and beautiful features of the style. It is ornamented with shafts bearing canopies, and niches filled with statues. Pinnacles are most frequently used on buttresses and parapets, and when placed over the former, serve as a deadweight to increase their power of resisting a thrust.

PINNULE, in Botany, a leaflet of a pinnate leaf, or of one which is bipinnate, tripinnate, &c. See LEAVES. The term is more frequently used, however, to designate the ultimate divisions of the fronds of ferns, when divided in the same manner.

PINSK, a town of West Russia, in the government of Minsk, surrounded by vast marshes called the Pinsk Marshes, stands on the banks of the Pina, a branch of the Pripiet, 752 miles south-south-

mouth at St. Petersburg, lat. 59° 5' N., long. 29° 5' E. It was founded in the 13th c., was destroyed for the second time by Lithuanians in 1529, was annexed together with Lithuania to Poland in 1569, and passed at last into the possession of Russia in 1795. The route at P., chiefly through, has increased, especially since the opening of the Vistulsky Channel, which connects the Dniester and the Black Sea with the Russian and the Baltic Seas. A very considerable number of ships and barges gather near the port. They are laden principally with salt, corn, hempseed, iron, glass, tar, oil, wax, tobacco, and timber. These goods are forwarded to the east and north-west, being employed for fuel in Austria, and by water to Moscow, Kieff, Odessa, Warsaw, &c. The manufacturing activity of the town is not great. Pop. 11,200, of which about 4,000 are Jews.

PIST, a measure of capacity used both for liquids and dry goods, and equivalent to the eighth part of a chaffin in v. l. or 34.08625 cubic inches. The French pint still in use, though superseded as a legal measure by the imperial pint, is equivalent to somewhat imperial pints.

PINTA DO, see **ANTARES TOWNS**.

PINTAIL, or **PINTAIL DUCK** (*Querquedula discolor*), a species of ducks, of the section with the hind-feathers devoid of membrane. The bill is without barbs at the base, narrow, with lamina not projecting beyond the margin. The tail of the male is long, and tapers to a point.—The Common P. (*P. anas*) is a handsome bird, rather longer in shape than most

Pintail Duck (*Querquedula discolor*).

of the ducks; the neck also longer and more slender. It is about equal in size to the mallard. The head is brown, with a white longitudinal line on each side extending down the neck; the back and sides marked with waving lines of black and greyish-white; the lower parts white, the elongated central tail-feathers black. It is a native of all the northern parts of the world, migrating southwards in winter, and a regular migrant of many parts of the British coast. It also frequents fresh-water lakes and rivers, and is common in winter in the valley of the Mississippi. Its winter range extends southwards to the Mediterranean and the Gulf of Mexico, and even to Africa and the West India Islands. Its food is very equal and various. It is very much esteemed for the table. It has been tamed, and has been in cultivation.

PIOMBINO, a principality now incorporated in the kingdom of Italy, lies along the Italian coast opposite the island of Elba, the greater part of which belonged to it. Its extent was about 172 English square miles; and its population, previous

to its incorporation with the rest of Italy, about 24,000. P. was originally a fief of the empire, and at the end of the 14th c. came into the possession of the family of Aragon, which, after ruling it for nearly 200 years, made way for a new dynasty, the family of Boncompagni. The latter dynasty was finally overthrown by the movements of the neighbouring states of Savoy and Naples afterwards. In 1801, the Boncompagni family were expelled by Napoleon, and the principality given to his sister Eliza, the wife of Louis, Prince of Parma, but the latter was deposed, and the old dynasty restored, by the Congress of Vienna; the principality being then put under the sovereignty of Tuscany, whose grand duke incorporated the Boncompagni for their loss of sovereignty. It is now a part of the province of Grosseto, in the kingdom of Italy. The strait between P. and Elba is called the 'Channel of Piombino.'

PIONNER, a military labourer, employed to form roads, dig trenches, and make bridges as an army advances; and to preserve cleanliness in the camp when it halts. Formerly, the pioneers were ordinary labourers of the country in which the army was, impressed for military purposes; but now such persons are only brought in as auxiliaries, a few men being attached to every corps as a permanent body of pioneers. In the British army, one man is selected for his intelligence, from every company. These pioneers march at the head of the regiment, and the senior among them commands as corporal. Instead of a musket, each man carries a sword-buck sword, which is at once tool and weapon. Each band also has one and two gun-spears, other necessary tools being distributed among them. There is something rather conflicting between the functions of the pioneers and those of the engineer force.

PIOTRKOW, a town of Poland, in the government of Warsaw, and 94 miles north-west of the city of that name close to the Warsaw and Vienna Railway. It is known to have existed in the 15th c.; but it is now a decaying town, carrying on no prominent and special branches of trade or manufacture. Pop. 11,200.

PIOTRI, Mrs (née **HENRY LYNN SALISBURY**), who cannot be forgotten while the great Dr Samuel Johnson continues to be remembered, was the daughter of John Salisbury, Esq., of Rednal, in Cambridgeshire, where she was born in the year 1739. Early introduced into the fashionable world of London, she claimed by her beauty and her lively manners; and, in 1762, was married to Mr Henry Thrale, a rich brewer, with a recognised position in society, and, at the time, one of the members for the borough of Southwark. Her acquaintance with Dr Johnson, which speedily became an intimacy of the closest and most affectionate kind, began shortly after. Of all Johnson's many friendships, this was perhaps, in certain essential respects, the most valuable to him. To Johnson, widowed and alone, and subject, as he had been throughout, to accessions of a mortal gloomy hypochondria, which made life at times to him an almost insupportable burden, the society of Mrs Thrale, and of the circle which she gathered round her, was a source of innumerable solace. Mrs Thrale, in particular, with her warm heart and bright womanly intelligence, was always a comforting presence; and her unflinching cheerfulness and vivacity suffered for him many an otherwise cloudy hour. The married life, though prosperous, was not an uniformly happy one, Mr Henry Thrale, though always a pleasant and kindly gentleman, being so much of an unjugal virtue. If Johnson owed her much, it may be

surmised that the benefit was in some sort reciprocal, and that, by her affectionate reverence and solicitude for her sage, she a little consoled herself for the gentlemanly indifference of her husband. On the death, in 1781, of her husband, Mrs Thrale retired with her four daughters to Bath, where, in 1784, she married Mr Gabriel Piozzi, an Italian teacher of music. This *mésalliance*—as it was held—was deeply censured by all her friends, and so unreasonably excited the ire of Dr Johnson in particular, that a rupture of friendly relations was the result. In the correspondence between them on the subject, it must be admitted the lady has much the better of the philosopher, whose tone of unmannerly rudeness gives some countenance to the good-natured suspicion of his friends, that he had an eye to the widow himself. Though the feud was ostensibly healed, the friends never again met; Mrs P. leaving England for Italy with her husband, and Dr Johnson dying soon after. Some little time subsequent to his death, she published an octavo volume, entitled *Anecdotes of Dr Samuel Johnson during the last Twenty Years of his Life*, in which it seemed to the indignant Boswell and others, that her main intention was to take her little feminine revenge on the deceased for his outrage in the matter of Piozzi. This work she supplemented in 1788 by a collection of *Letters to and from Dr Samuel Johnson*, in 2 vols. 8vo. Of works more properly her own, may be mentioned, *Observations and Reflections made in the course of a Journey through France, Italy, and Germany* (2 vols. 8vo, 1789); *British Synonymy, or an Attempt at regulating the Choice of Words in Familiar Conversation* (2 vols. 8vo, 1794); and *Retrospection, or a Review of the most striking and important Events, Characters, Situations, and their Consequences, which the last Eighteen Hundred Years have presented to the View of Mankind* (2 vols. 4to, 1801)—books long since utterly forgotten, if ever they were at all read and remembered. Having survived her second husband, her own celebrity, and almost in some sort that of the great Dr Johnson, with whom her name remains indissolubly connected, Mrs P. died at Clifton, near Bristol, on the 2d May 1821.

PIPA, a genus of batrachians, in general form resembling frogs and toads, and characterised by the very broad and triangular head, the sides of which are destitute of the glands (*parotoids*) so large in the true toads; the eyes small, and situated near the margin of the lower jaw; the ear concealed beneath the skin; the tongue merely rudimentary; the jaws destitute of teeth; the fore-feet not webbed, but divided into four fingers, each of which divides at the extremity into four small points, these, again, being minutely divided in a similar manner; the hind-feet five-toed and completely webbed; the larynx of the male extremely large—a triangular bony box, within which are two small movable bones for occasionally closing the entrance of the bronchi; the back of the female furnished with numerous cells or pouches, in which the eggs are hatched, and the young undergo all their transformations till they have attained a form similar to that of their parents. These characters are so remarkable as to make the creatures of this genus objects of peculiar interest, but particularly the mode of rearing the young. It was at first supposed that the young were produced in some unusual way in the cells from which they were seen finally to emerge; but this is not the case. The eggs are deposited by the female in the ordinary manner, and are carefully placed by the male in the cells of her back, which close over them. When the young are ready to use their limbs, they struggle out of the cells, to which they never afterwards

return. The best-known species of P. is that commonly called the Surinam Toad (*P. Surinamensis*), a native of Guiana and other warm parts of continental America, where it inhabits swamps and ditches, and is occasionally found in damp and dirty corners of houses. It is sometimes seven inches long; its colour is brownish-olive above, whitish below; the skin covered with small hard granules, mingled with occasional horny tubercles. The whole aspect of the creature is peculiarly hideous.

PIP. See POULTRY.

PIPE, a measure of quantity commonly employed in Portugal, Spain, France, and in some other countries which trade with these. It is used almost exclusively for wine and oil, and has a particular value for almost each locality. The pipe is called in England a butt, and is equal to two hogheads, or half a tun. The pipe of Oporto is larger than those of Lisbon and of Spain in the proportion of 93 to 76. There are three different measures of this name in France; and there was formerly a pipe, a measure of capacity for dry goods, in use by the Bretons. But the pipe in England varies with the description of wine it contains: a pipe of port contains 114 imperial gallons; of sherry, 108 imperial gallons; and of madeira, 92 imperial gallons; while the common English pipe contains 126 wine gallons, or 105 imperial gallons nearly.

PIPECLAY is a fine Clay (q. v.), free from iron and other impurities, having a grayish-white colour, a greasy feel, and an earthy fracture. It adheres strongly to the tongue, and is very plastic, tenacious, and infusible. It is used for the manufacture of tobacco-pipes and white pottery. The localities where it is chiefly obtained are Devonshire, and the Trough of Poole in Dorsetshire. It is also found in various places in France, Belgium, and Germany.

PIPE-FISH (*Syngnathus*), a genus of oss. fish fishes of the order *Lophobranchii* (q. v.), and of the family *Syngnathidae*. In this family the form is elongated, there is little flesh, and the body is almost covered with partially ossified plates; the head is long; the jaws are elongated so as to form a tubular snout—whence the names P. and *Syngnathus* (Gr. *syn*, together; and *gnathos*, a jaw); and the males have pouches, variously situated, in which they receive the eggs of their mate, and carry them till they are hatched. The family *Syngnathidae* is sometimes restricted to those in which the egg-pouch

Pipe-Fish (*Syngnathus acus*).

of the males is on the tail, and is open throughout its whole length, and the tail is not prehensile. Thus restricted, it contains a number of genera, of which one only, *Syngnathus*, is British.—One of the most common British species is the GREAT P. (*Syngnathus acus*), which is sometimes found in deep water, and sometimes at low tide among the sea-weed in rock-pools. The specimens commonly seen are from 1 foot to 16 inches in length; but this fish is said to attain

a length of 2 or 3 feet. Its leaf and that of the other species, is believed to consist of small narrow subovate and the apex of lobes; and it may be seen slowly moving about with various contractions, pushing its long root into every crevice in search of food, and sometimes assuming a vertical position with the root downwards, poking into or emerging the soil. This and the other (epiphytic) singular direction for their young, which are believed to derive, on the appearance of danger, to the parent of their mode of root, after they have begun to leave it, and to creep about in the soil.

The genus *P.* is sometimes also given to the tribes *Saururus* and family *Cruciferales* (q. v.), or *Flabiferales*, sometimes called *Piperaceales*.

PIPERACEÆ, a natural order of exogenous plants, natives almost exclusively of the hottest parts of the globe, particularly of Asia and America. None of them found in cold regions. About 600 species are known, to most of which the name *PIPER* is sometimes given, although some are also known by other names, particularly those of which the fruit is not used as a spice, but of which some sort is employed for some other purpose, as *Helid*, *Cubeba*, *Malice*, and *Ara*. One of these leaves, Hot Pepper (q. v.) is the most important product of the order. Of the *P.*, a few are almost trees, but they are generally shrubs or herbaceous plants, often climbing. They have pointed stems, opposite whorled or alternate leaves, with or without stipules, and insignificant terminal flowers in slender spikes, unisexual or hermaphrodite; the different kinds generally mingled in the same spike; the flowers without calyx or corolla, but each with a bract, the stamens 2-8, the ovary with one cell and one ovule, and crowned with one or three stigmas; the fruit somewhat fleshy, containing one seed.

PIPERINE ($C_{12}H_{19}NO_3$) is an alkaloid possessing very weak basic properties, which is found in the Pepper tribe. It may be obtained by heating powdered pepper with alcohol, which extracts the piperine and some resinous matter, which may be removed by distillation in a solution of potash. It occurs in colourless well-formed prisms, which are insoluble in cold water, but dissolve readily in alcohol and ether. According to Miller, piperine 'has no sour taste, resembling that of pepper;' while Geoff. Meunier asserts that 'it is devoid of odour or taste, and that, consequently, the well-known preparation of pepper are not dependent on it.' On heating piperine with soda lime, a remarkable oily base, *Piperidine* (C_4H_9N), is obtained, with a pungent odour, resembling both that of ammonia and pepper.

PIPES or TUBES, are made of various materials and for various purposes. Thus, we have draining-pipes for agricultural and sanitary purposes, made of earthenware, wood, and metal; pipes of various kinds of metals for a great variety of purposes, and Tobacco-pipes (q. v.) of various materials. Formerly, wooden pipes were extensively used for conveying water and for draining; but so great an improvement has been effected of late years in the manufacture of metal and earthenware pipes, that they have now become exceedingly rare, and will soon disappear. For agricultural purposes, drains are made of ordinary brick-clay; and owing to the use of machinery in their manufacture, they are produced very rapidly and cheaply. They are of various sizes, but the most general is 15 inches in length by 3½ inches diameter. The operation in the drain-laying machine is to squeeze a continuous length of soft plastic clay through a ring-shaped orifice, the centre of which is occupied by a wire or mandrel of the size of the hollow part of the

pipe. Another arrangement of the machine is to cut the pipe to the proper length, as it passes through, and by means of a travelling table, to carry them forward to be connected to the sheds, where they are dried, previous to being buried in the field.

Within the last twenty years, earthenware pipes have been made of almost every size, from an inch or two in diameter up to the enormous size of fifty to 60 inches. They are usually made of fire-clay, and are glazed like common pottery. One *Porcelain*. They are white at one end, so as to form a socket, as in fig. 1, to receive the end of another, and thus form a continuous tube. These are greatly used for the drainage of houses, and for sewerage, for which

Fig. 1.

they are admirably adapted; the inner surface being glazed as well as the outer, offers no resistance to sedimentary matters, which are consequently carried away readily. These pipes are of such great strength, that many small towns in England are now covered with them almost entirely. Another kind has been introduced for chimney flues. They are also made of fire-clay, but unglazed externally, and so thick, that there is little fear of breaking. They are placed one on another, and are built into the walls of houses, instead of the ordinary chimneys, and in this way save much labour in building,

Fig. 2.

and afford a much more effective, and easily cleaned flue (fig. 2). *Cautchouc*, *rubber*, and *gutta percha* are also extensively used for making pipes for a variety of purposes, their flexibility rendering them very useful. *Leather* pipes are used chiefly for the conveyance of water temporarily, as in the case of fire-engines; they are generally called *hose*. Metal pipes are made of iron, lead, tin, or an alloy of tin and lead, copper, brass, &c. Iron pipes are usually cast, and the manufacture of such pipes has become of enormous extent, in consequence of the vast works, by which almost all large towns in this kingdom, and in many foreign states are now supplied with water and gas, the pipes for which are largely exported from Great Britain. A great proportion of the trade in cast-iron pipes is carried on in Scotland. The waterworks which supply the great towns of Lancashire have nearly all been furnished with pipes from Scotland, and the magnitude of the supply can be best understood when it is known that for the Birington Park Works, which supply Liverpool, upwards of twenty miles of iron pipes, nearly four feet in diameter, are required. It would be impossible to make a correct estimate, but it has been hinted, with great reason for belief, that in Great Britain the gas and water-pipes sold are not exceed half a million of miles in length.

Pipes made from the ductile metals, such as brass, copper, and tin, are made by first casting an ingot of the metal into the shape shown in fig. 3, with a hole through its length of the same diameter the bore of the pipe is intended to have. Into this is placed an iron rod, called the mandrel (q. v. fig. 4), which exactly fits, and which projects slightly at the tapered end (q. v. fig. 4). It is then

PIPE-STICKS—PIPPIN.

brought to the drawing-table, and here the small end with its projecting mandrel is put into a funnel-shaped hole, drilled through a steel post (a, fig. 5),

so as to allow the point to be gripped on the other side by a pair of pincers, at the end of a strong chain; the machine-power is then applied to the other end of the chain, and the soft metal and its mandrel are drawn through, the former being extended equally over the surface of the latter, which is then removed, and the length of pipe is complete. Some metals require repeated drawing through holes, getting gradually smaller, and have to be softened or annealed at intervals, as the metal hardens under repeated drawing. In this way, brass, copper, tin, and pewter pipes are made; and a patent has just been taken out for making steel ones; but lead pipes are made of great lengths by squeezing the soft metal through a hole in a steel plate in which there is a fixed core or mandrel projecting, which forms and regulates the size of the bore of the pipe. Pipes are also made from copper, brass, and malleable iron by rolling out narrow strips of metal, and then passing them successively through rollers, which are deeply grooved, and which turn up the edges (fig. 6). A mandrel is then laid in it, as in fig. 7, and it is next passed through double-grooved rollers, which turn the edges in, and thus form a complete tube round the

mandrel. The edges, however, require soldering or welding, if of iron. All boiler tubes used to be made in this way; but the method of drawing has lately been so much improved, that copper and brass pipes, or tubes, as they are frequently called, are now drawn of considerable thickness and diameter.

PIPE-STICKS. It is usual to call the wooden tubes used for some tobacco-pipes by this name; and unimportant as it may at first sight appear what the tube is made of, there is great difference of taste in this respect; and great care is taken by some smokers to get what they consider the choicest material. Perhaps the most prized are the Agriot or Cherry pipe-sticks of Austria. These are the young stems of the Mahaleb Cherry (*Prunus Mahaleb*), which is extensively grown for the purpose in the environs of Vienna. An astonishing amount of care is bestowed on the cultivation of these shrubs, which are all raised from seed. When the seedlings are two years old, they are each planted in a small pot, and as they continue to grow, every attempt at branching is stopped by removing the bud. As they increase in size from year to year, they are shifted to larger pots or boxes, and great care is taken to turn them round almost daily, so that every part is

equally exposed to the sun. When they have attained a sufficient height, they are allowed to form a small bushy head, and continue to receive the same attention in daily turning, &c., until they are thick enough in the stem. They are then taken up, and the roots and branches removed, and the stem put by to season. Afterwards, they are bored through, and are ready for use. These pipe-sticks have an agreeable odour, and are covered with a reddish-brown bark, which is retained. Sometimes they are five feet in length, and as smooth and straight as if turned. When of such a length, they command high prices. In Hungary, pipe-sticks made from the stems of the Mock Orange (*Philadelphus coronarius*) are much used; and the jessamine sticks of Turkey are in great esteem in all countries. Orange and lemon-trees and ebony are also used. The chief recommendation of these materials seems to be in the power of the wood to absorb the oil produced in smoking tobacco, and consequently to render the smoke less acrid. See TOBACCO-PIPES.

PIPI, the name given to the ripe pods of *Cæsalpinia Papai* (see *CÆSALPINIA*), which are used in tanning, and are not unfrequently imported along with Dividivi (q. v.), and sometimes separately, but not to any considerable extent, being very inferior to dividivi. They are easily distinguished from the pods of dividivi, not being curved as they are, but straight.

PIPING CROW. See *BARITAE*.

PIPIT, TITLING, or TITLARK (*Anthus*), a genus of birds included by Linnæus among Larks (*Alauda*); but now regarded as forming even a distinct family, *Anthidae*, which is ranked among the *Dentirostres*, whilst the lark family (*Alaudidae*) is ranked among the *Contirostres*. The bill is more slender than in larks; the tips of the mandibles slightly bent downwards and notched. The hind-claw is long, although not so long as in larks, and more or less curved. The plumage resembles that of larks; in habits and motion of the tail, there is a greater resemblance to wagtails. The bill is not strong enough for feeding on grain or hard seeds, and insects and worms are the principal food of pipits. The most common British species is the *MEADOW P.*, *COMMON TITLARK*, or *TITLING* (*A. pratensis*), familiarly known in many parts of England and of Scotland as the *Moss-catcher*. It is found in almost all parts of Europe, and the north of Asia, in Western India, in Japan, and in Iceland. It is a small bird, its colour brown of various shades. It frequents heaths, mosses, and pastures; and usually makes its nest on a grassy bank, or beside a tuft of grass or heath. Its song is weak and plaintive, and it generally sings in the air. It is gregarious in winter. The cuckoo is said to deposit its egg more frequently in the nest of the Meadow P. than in that of any other British bird.—A rather larger British species is the *TREE P.*, or *FIELD TITLING*, which has a shorter claw, and perches on trees, frequenting enclosed and wooded districts. It is a summer visitant of Britain, and most common in the south of England. It occurs in most parts of Europe, in Asia, and the north of Africa.—The *Rock P.*, or *SEA TITLING* (*A. petrosus*), is to be found on the shores of all parts of Britain and Ireland. It is rather larger than the Tree P., and has a long curved hind-claw. It feeds chiefly on small marine animals, seeking its food close to the edge of the retiring tide.

PI'PPIN (so called probably because raised from the pip, or seed), a name given to many varieties of apple, among which are some of the finest in cultivation, as the *Golden P.*, *Ribston P.*, &c. The

Rubens P. was long supposed to be an originally English vessel, produced at Rubens Hall in Yorkshire, but it is proved to have been introduced from Germany in the beginning of the 18th century.

PIQUE WORK, a very fine kind of inlaying with gold, silver, and other costly materials; it is, in fact, a kind of half-work (q.v.) carried out on a very intricate scale. It is only applied to articles of small size, such as snuff-boxes, card-cases, and similar articles.

PIQUET is a small body of men posted at some point beyond the general line of the army or corps, for the purpose of observing the motions of an enemy, or giving timely notice in case of any attack. *Piquets* are either *outlying* or *lying*.

PIQUET, a game of cards played between two persons with thirty-two cards—i.e., the four honours, and the highest four plain cards of each suit. The cards are shuffled and cut as in whist, and then dealt, two by two, till each player has twenty, and the remaining eight, called the *talon*, or stock, are then laid on the table. The first player must then discard from one to ten of his cards, replacing them with a similar number from the *talon*; and after him, the second must discard if he pleases, suitably making up his proper number from the remaining cards of the *talon*. The player who first scores 100 wins the game, and the score is made up by reckoning in the following order—cards blank, the point, the sequence, the quatorze, the cards, and the aces. *Blank* is a hand of twelve plain cards, and counts ten for the player who possesses it. The *point* is the greatest number of cards in any suit, or, if the players are equal in this respect, that which is highest in value (the ace counting eleven, each court card ten, and the plain cards according to the number of pips); and counts a number equal to the number of cards in the suit. The *sequence* is a regular succession of three or more cards in one suit, and the highest sequence (i.e., the one containing the greatest number of cards, or if the players have sequences equal in this respect, the one of the two which begins with the highest card); if of three cards, counts three; if of four cards, four; if of five cards, five; and if six cards, sixteen, &c. The *quatorze* is a set of four equal cards (not lower than tens), or four aces, four queens, &c., and the highest quatorze counts fourteen for its holder; but should neither player have a quatorze, then the highest set of three is counted instead, but it counts only three. The *sequence* of the highest sequence or the highest quatorze also counts all inferior sequences and quatorzes (including sets of three); while his opponent's sequences and quatorzes go for nothing. The first player reckons his points, and plays a card; the dealer then reckons his points, and follows the opponent's lead, and cards are laid and tricks are taken as in any ordinary card game. Each player counts one for every card he lays, and the game of the trick (if second player counts one for it, the possessor of the greater number of tricks counting two in addition (the 'cards'), or if he takes all the tricks, he counts forty in addition (the 'traps'). If one player counts thirty—i.e., 99 by his various points, and one for the card he lays, having his adversary has counted anything, he at once doubles his score, reckoning sixty instead of thirty; this is called the '*peque*'; and should his score reach thirty before he plays a card, or his adversary begins to count, he counts at once to twenty (the '*re-peque*').

PIRACY is robbery on the high sea, and is an offence against the law of nations. It is a crime not against any particular state, but against all

maritime, and may be punished in the competent tribunal of any country where the offence may be found, or into whose he may be carried, although committed on board a foreign vessel on the high sea. It is of the essence of piracy that the party has no intervention from a sovereign state, or from the belligerent state at war with another. Pirates being the common enemies of all mankind, and all nations having an equal interest in their suppression and punishment, they may be lawfully captured on the high sea by the armed vessels of any particular state, and brought within its territorial jurisdiction for trial in its tribunals. The African slave-trade was not considered piracy by the law of nations, but the measured laws of the United Kingdom out of the United States by statute declared it to be so; and since the treaty of 1841 with Great Britain, it is also declared to be so by Austria, Prussia, and Russia.

PIRELLA (Gr. Πύρρα), the principal harbour both of ancient and modern Athens (q.v.). Only a few traces remain of the long walls which formerly united it and Mureykeia with the capital city. The western P., which has sprung up since 1833, is a regularly laid-out town, with some good houses and shops, and is connected with Athens by a carriage-road that follows the line of the more modern of the ancient walls. The population of the town in 1862 was 6864. The harbour, called also *Perna* (from *Drakoni*), is both safe and deep; but its entrance is narrow. In 1858, the number of vessels entering the P. was 7157, whose tonnage amounted to 347,432.

PIRANO, a seaport of Austria, is the metropolis of Istria, stands on a peninsula in the bay of Lussin, 15 miles south-west of Trieste. It contains an old castle, has a port and several dockyards, commissions boats, in which large vessels find safe anchorage, and is the seat of considerable trade and commerce. Among its more important edifices are an interesting Gothic church, a town-house, and a Minorite convent, with a number of good pictures. Wine and oil are made in considerable quantities, and there are salt-works in the neighbourhood, which produce upwards of 330,000 cwt. of salt annually. Pop. 9230.

PIRAYA, or **PIRÁI**, the name given in Guinea to *Serranodon piraia*, and other species of *Serranodon*, a genus of fishes of the family *Characidae*, regarded by many as a section of *Solanodon* (q.v.). The fishes of this genus, of which numerous species inhabit the rivers and other fresh waters of tropical South America, have a compressed and deep body, the belly keeled and serrated with a double row of hard serrations. They are extremely voracious fishes, and not only consume with great rapidity dead carcasses thrown into the water, but attack living creatures very much larger than themselves, biting off the fins of large fishes, and then devouring those at leisure, often mutilating ducks and geese by depriving them of their feet, and venturing to attack even man and human beings. The latter, however, make reprisals on them, and find them very good food. *Serranodon piraia* seldom exceeds 10 or 12 inches in length, but some of the species attain a considerably larger size. Some of them are very brilliantly coloured. The Indians use the teeth for sharpening the arrows, made of the very hard ribs of palm-leaves, which they use for their blow-pipes, and which they sharpen to a very fine point by drawing them across a *piraia*'s jaw, an article with which the Indian of Guiana is always provided; on the edge of the teeth used to be seen. *Piraya* are readily taken by a baited hook, and almost any

kind of bait will do; but they at once cut through any line, and the line must therefore be cased above the hook in tin-plate. The Indians often shoot them with arrows.

PIRMASENS, a small town of the Bavarian Palatinate, and formerly the chief town of the county of Hanau-Lichtenberg, 22 miles west of Landau. It has 6735 inhabitants, who manufacture shoes and musical instruments.

PIRMA, a small town of Saxony, stands on the left bank of the Elbe, 11 miles by railway south-east of Dresden. It is surmounted by a hill, crowned by a castle, now used as a lunatic asylum, contains a beautiful parish church, and a number of important benevolent institutions. The manufacture of stoneware employs many hands. Pop. about 6000.

PISA, one of the oldest and most beautiful cities of Italy, and, till lately, the capital of the now extinct grand-duchy of Tuscany, is situated in a fruitful valley, on the banks of the river Arno, which intersects the city and is spanned by three noble bridges. P. is situated in 43° 43' N. lat., and 11° 24' E. long. The population was, in 1862, 51,057. It has broad, straight, well-paved streets, and several fine squares. Among its 80 churches, the most worthy of notice is the cathedral, or Duomo, begun in 1068, and completed in 1118, with its noble dome, supported by 74 pillars, and its fine paintings, variegated marbles, and painted windows. Near the cathedral stands the round marble belfry known as the Leaning Tower of Pisa, from the circumstance that it deviates about 14 feet from the perpendicular. This celebrated building, which is 180 feet in height, and consists of seven stories divided by rows of columns, and surmounted by a flat roof and an open gallery commanding a splendid view of the surrounding country, was erected in the 12th c. by the German architect Wilhelm of Innsbruck. The Baptistery, or Church of St John, opposite the cathedral, an almost equally remarkable structure, was completed in 1162 by Diotisalvi. The main building, which is circular, and raised on several steps, supports a leaden-roofed dome, having a second dome above it, surmounted by a statue of St John. The beautifully proportioned interior, noted for its wonderful echo, contains a pulpit, which ranks as the greatest masterpiece of Nicola Pisano, various pieces of sculpture, and a large octagonal marble font. The Campo-Santo, or ancient national cemetery, dates from the year 1228, when the Pisans caused earth to be brought from Jerusalem for the graves of the most distinguished citizens of the republic. In 1283, the ground was surrounded by cloisters, the walls of which were adorned by fresco-paintings, now nearly obliterated, although some of these works of art, which are chiefly by Giotto, Veneziano, Orcagni, and Memmi, still retain traces of their original beauty. Among the other public buildings of P., special notice is due to the churches of La Madonna della Spina and San Stefano, both rich in paintings and sculptures, and the latter famous for its organ, the largest in Italy; the grand ducal and Lanfranchi palaces; the Torre della Fame, so called from its being supposed to have been the spot in which Ugolino Gherardesca and his children were starved to death in 1288; the university, founded in 1330, and restored by Cosmo I. de' Medici, which enjoyed a high reputation in the middle ages, and still possesses claims to consideration in its library, botanical garden, observatory, and affiliated schools and art collections, &c. The population of P., which, in the 13th c., amounted to 150,000, had fallen, in the present century, to less than one-sixth of that number; but of late years, trade and

industrial arts have made a rapid advance, and the population has increased in proportion. In the neighbourhood of P., at the foot of San Giuliano, lie the mineral baths, whose fame was known to Pliny, and which continued through the middle ages to attract sufferers from every part of Italy. The waters, which are rich in carbonic acid and chloride of sodium, are found efficacious in various arthritic and rheumatic affections.

History.—Ancient P., like other Etruscan cities subject to Rome, retained its municipal government, and enjoyed an almost unlimited freedom while nominally under Roman protection; but, on the decline of the imperial power, it was compelled to submit in turn to the various transalpine nations who successively overran Northern Italy. Early in the 11th c., P. had risen to the rank of a powerful republic, whose sway included the then fertile district known as the Maremma di Lerici, and which yielded little more than nominal homage to its suzerain lords, the emperors of Germany. Throughout the 11th c., P. was at the height of its prosperity, and to this period belong most of the splendid monuments of art that still adorn the city. Its troops took part in all the great events of the Holy Land; and its fleet in turn gave aid to the pope in Southern Italy, to the emperor in Northern France, chastised the Moors, and exacted its own terms from the Eastern emperors. In their wars with the Saracens of Sardinia, the Pisans had conquered Sardinia, Corsica, and the Balearic Islands, and for a time maintained their ground against their hereditary enemies, the Genoese; but having sided with the Ghibellines in the long wars which desolated the empire, P. suffered severely at the hands of the victorious Guelphic party. Indeed, the rivalry of the Guelphic cities of Florence, Lucca, and Siena, nearly brought P. to the brink of ruin at the close of the 13th c.; and after struggling for more than a hundred years against external foes and the internal dissensions between the democratic mob and the Ghibelline nobles, without losing their character for indomitable valour, the Pisans finally threw themselves under the protection of Galeazzo Visconti of Milan. The son of the latter sold the Pisan territory to their greatest enemies, the Florentines, from whose tyrannical rule it was for a time relieved by Charles VIII. of France, who, in 1494, accepted the protectorate of the city. When the French left Italy, the old struggle was renewed; and after offering a desperate resistance, the Pisans, in 1509, were compelled by hunger to surrender the city to the Florentine army besieging the walls. The most influential families, as formerly in 1496, when P. first lost her independence, preferred emigration to subjection, and removed to Sardinia and Sicily, since which time, P. has remained incorporated with the Florentine territories of Tuscany.

PISA, COUNCIL OF, one of the councils commonly reputed by Roman Catholics as œcumenical or general, although some, especially of the Ultramontane (q. v.) school, do not look upon it as such. It was assembled in the time of the great Western Schism, for the purpose of restoring the peace of the church, and the unity which had been interrupted by the rival claims of two competitors for the papacy. The history of this rival claim will be found under the head **WESTERN SCHISM**. For our present purpose, it is enough to state that the adherents of both the claimants of the see of Rome—those of Gregory XII., as well as those of Benedict—agreed on the necessity of a general council, as the only means of putting an end to the schism; and the rival popes having themselves either evaded or declined the demand, the cardinals of both united in issuing letters of convocation, and in summoning

both the claimants to the council in person. Neither of them complied with the citation; but the council proceeded, nevertheless, to examine and adjudge upon the cases. It was opened at Pisa, March 28, 1563. There being present 94 cardinals, a patriarch, 19 archbishops, 50 bishops together with representatives of 15 archbishops and 102 bishops, and a vast body of abbots, doctors in theology, and other eminent ecclesiastics. Of the proceedings it will be enough to say, that after a formal citation of the rival popes to appear within a stated period, the council, on the expiration of that period, proceeded to declare them contumacious, and to excommunicate their respective claims as though they had appeared. The result, after a protracted inquiry, was a decree in the 17th session by which they were both declared schismatics and their excommunication, and calculated to lead the people from the truth, erroneous, since they had violated the solemn engagements made at their respective elections, that were deprived from the papal dignity, and their followers released from obedience." In the 17th session, the cardinals having first pledged themselves by oath, each, that if elected, he would maintain the sittings of the council, entered into each other to the number of 24, and unanimously elected Peter Philargi, one of the cardinal priests, and a member of the Franciscan order. He took the name of Alexander V. The council proceeded after his election to pass a number of decrees, for the purpose of giving validity to the acts done on either side during the schism. A vote attempt was made to obtain the submission of the still remnant rivals, and it was resolved that a new council should be held within three years. The authority of this council, like that of the Council of Constance, is alleged, on the Gallican side, as establishing the superiority of a general council over the pope. But the Ultramontanes reply that both these councils, and also that of Basel, must be regarded as abnormal assemblies, called to meet the special emergency of a disputed succession and of a doubtful pope, and that those principles cannot by any means be applied to the ordinary circumstances of the church, or even as precedents by which to estimate the normal relations between a pope whose title is certain and undisputed, and a general council regularly assembled at a time of peace, and in the ordinary circumstances of the church. It cannot be doubted, nevertheless, that the spirit of the fathers of Pisa was the same which ran through the succeeding assemblies of Constance and Basel, and found its permanent representation in the Gallicanism (see *GALLICAN CHURCH*) of later centuries.

PISCICULTURE, a river about 50 miles in length, which forms the southern part of the boundary between Maine and New Hampshire, U.S., and empties itself into the Atlantic, forming at its mouth the excellent harbour of Portsmouth.

PISCICULTURE, or **FISH CULTURE**, the breeding and rearing of fishes, in order to the increase of the supply for food. Hitherto, it has been almost entirely limited to fresh-water fishes; nothing having been done as to sea-fishes but by legislation, chiefly in the case of the herring—to prevent the destruction of the very young fish, and that was, apparently, to much advantage. Ponds for sea-fishes have, indeed, been sometimes constructed, advantage being taken of natural circumstances favourable for the purpose; the ancient Romans had such ponds, and some have been made in different parts of the British isles; fishes being caught in the open sea and placed in them to be fed and fattened for the table. Such ponds, however, are of little real utility. That the Romans

succeeded in keeping sea-fishes in fresh-water ponds as has been asserted, must be regarded as very false, in an exaggeration founded on the fable which a few fishes have of adapting themselves both to fresh and salt water. But it may be asked if in modern times sufficient advantage has been taken of this power.

Ponds for fresh-water fishes have been common from a very remote antiquity. It appears from Jewish, viz. 16, that they were used in ancient Egypt. In the times of Roman luxury, almost every wealthy citizen had fish-ponds. The Romans have long bestowed more attention on pisciculture than any other nation, and with them it is truly a branch of economy, tending to the increase of the supply of food and of the national wealth; and, merely, as it seems to have been among the Romans an appendage of the luxury of the great. In some countries of modern Europe, this branch of pisciculture is also prosecuted to a very considerable extent, particularly in Germany and Sweden, and in late years in France, in order to the supply of fish for the market. In Britain, it has never been systematically prosecuted, as for any important purpose; the country seats of the nobility and gentry being, indeed, generally provided with fish-ponds, but in most cases rather as ornamental waters than for use. In the northern parts of Britain, trout, perch, and pike are almost the only fish kept in ponds; in England, they are often stocked with carp and tench, and are turned to much better account than in Scotland. In Germany, ponds carefully attended to are found very productive and remunerative. There can be no doubt that in Britain, also, many a piece of land at present very worthless, might easily be converted into a pond, and made to yield large quantities of excellent fish; but such a thing seems almost never to be thought of.

In the construction of ponds, or dams, for fish, it is recommended to have, if possible, a succession of three ponds on the same rivulet, with sluices, by which they can be dried, so that the fish may be easily taken when required, the different ponds being in part intended for fish of different ages. But all this must be very much regulated by local circumstances. It is of more importance to make that the margins should be shallow, so that there may be abundance of reeds and other water-plants, and that only a small part of the pond should be too deep for the growth of pond-weeds (*Potamogeton*). Much depends on the soil of the neighbourhood as to the supply of food, and consequently the growth of fish and productiveness of the pond. Trees overhanging the pond are not desirable; the decomposition of their fallen leaves being injurious to fish. The growth of weeds is more to be encouraged in ponds for carp and tench than in those for perch or trout. A stony bottom is very advantageous to perch and trout ponds. Ponds for pike must be larger than is necessary for any other fish known to British pisciculturists; an extent of at least six acres is desirable. A nursery for minnows may be established with great advantage in connection with a fish-pond, as they afford most acceptable food to perch, pike, and trout. But in a pond where carp and tench are expected to spawn, the presence of minnows is very undesirable. It is often impossible to provide a pond with a place suitable for the spawning of trout, for which a gravelly stream with a quick current is necessary; but for perch, pike, carp, or tench, the pond itself is sufficient, and the stock once introduced is kept up without replenishing. Indeed, it is recommended that a pond stocked with carp should also be stocked with pike, that the excessive multiplication of the carp may be checked

PISCICULTURE

which would otherwise prevent the fish from growing rapidly or to a good size.

The greatest improvement in pisciculture, and a most important branch of it, to which the term is often restricted, is the breeding of fish in artificial breeding-places, from which not only ponds but rivers may be stocked; or the art of fecundating and hatching fish-eggs, and feeding and protecting the young animals till they are of an age to secure their own food, and protect themselves from their numerous enemies. As at present conducted, pisciculture has become in many instances a profitable branch of industry; and the art has been employed in France with great success for replenishing with fishes many of the most important streams that had become barren through over-fishing; in Britain, also, this artificial system has become a profitable adjunct of one or two of our larger salmon-fisheries.

Modern pisciculture is the revival of an old art well known to the ancient Italians, but which had fallen into abeyance for a number of centuries. The art of breeding and fattening fish was well known to the luxurious Romans, and many stories are told about the fanciful flavours which were imparted to such pet fishes as were chosen for the sumptuous banquets of Lucullus, Sergius Orata, and others. The art had doubtless been borrowed from the ingenious Chinese, who are understood to have practised the art of collecting fish-eggs and nursing young fish from a very early period. Fish forms to the Chinese a most important article of diet; and from the extent of the water-territory of China, and the quantities that can be cultivated, it is very cheap. The plan adopted for procuring fish-eggs in China is to skim off the impregnated ova from the surface of the great rivers at the spawning season, which are sold for the purpose of being hatched in canals, paddy-fields, &c.; and all that is necessary to insure a large growth of fish is simply to throw into the water a few yolks of eggs, by which means an incredible quantity of the young fry is saved from destruction. Although all kinds of fish are enormously fecund, it is well known to naturalists that only a small percentage of the eggs ever come to life, and of the young fish, very few ever reach the table as food. So many of the eggs are destroyed by various influences, and so many likewise escape impregnation, that if we are to keep up our fish supplies, pisciculture, or protected breeding becomes absolutely necessary.

Commercial pisciculture, as at present carried on, owes its origin to the French, the art having been first put in practice by M. Remy, a poor fisherman, who gained a living by catching fish in the streams of La Bresse in the Vosges. This re-discovery of the lost art of fish-breeding is understood to have been quite accidental on the part of Remy, although it is thought by some zealous Scotchmen that the Frenchman must have heard of the experiments of Mr Shaw of Drumlanrig, who, for a few years previous to Remy's discovery, had been trying to solve some problems in the natural history of the salmon by means of the artificial system. The art had also been partially revived in Germany about the middle of last century by a gentleman of the name of Jacobi, who practised the artificial breeding of trout. Whether or not Remy had heard of either of these experimenters, it is certain that to him we owe the revival of the art in its larger or commercial sense; the others only used it as an adjunct to their study of the natural history of fishes. In one sense, fish-culture was largely practised in this country long before the discovery by Remy of the system of artificial fecundation—we allude to the fact of there being large numbers of private ponds and stews in which country gentlemen bred fish for the

use of their own tables, as well as similar places attached to monasteries and other religious edifices, in which fish were grown for fast-day uses. The range of fish suited for pond-breeding was very limited; and to render them at all good in flavour, expensive food had to be obtained for them, and they had to be served up accompanied by expensive sauces. It is probable that some of our rarest fishes were introduced into this country during these old monastic times, such as the Lochleven trout, the vendace, &c.

It was the great waste of eggs incidental to the natural system of fish-breeding that led Remy, about 1842, in conjunction with Gehin, a coadjutor whom he assumed as a partner, to try what he could do in the way of repeopling the fish-streams of his native district. His plan being at once successful, attracted the favourable notice of many of the French savans, and led to rewards and preferment for Remy; the new art was taken under the protection of the government; and now, after the experience of twenty years, artificial fish-culture has been so perfected in France that there has arisen at Huningue, near Basel, on the Rhine, a gigantic fish-nursery and egg-dépôt for the supply of eggs, and the dissemination of the art both in France and other countries. The place is fitted up specially for this purpose with egg-boxes and reservoirs; and millions of eggs are annually received, and sent to Germany, Spain, England, and other places. A drawing is given on the next page of one of the halls of this interesting establishment.

The course of business at Huningue is as follows: the eggs are chiefly brought from the streams of Switzerland and Germany, and embrace those of the common trout, as well as the Rhine and Danube salmon, and the tender charr or ombre chevalier. People are appointed to capture gravid fish of these various kinds, and, having done so, to communicate the fact to Huningue. An expert is at once sent to deprive these fishes of their spawn, and bring it to the breeding or resting boxes, where it is carefully tended till it is ready to be despatched to some district in want of it. It is, of course, much more convenient to send the eggs than the young fish, as the former, nicely packed among wet moss in little boxes, can be carried to a distance with greater facility. The mode of artificially spawning a salmon is as follows. It should, of course, be ascertained that the spawn is in a perfectly matured state, and that being the case, the salmon is held under water in a large tub, while the hand is gently passed along its abdomen, when, if the ova be ripe, the eggs will flow out like so many pease. The eggs are then carefully washed, and the water is poured off. The male salmon is then handled in a similar way, when the contact of the milt immediately changes the eggs into a brilliant pink colour. After being again washed, they may be ladled out into the breeding-boxes, and left to come to life in due season. The period occupied in hatching is different in different climates. At Stormontfield, where the eggs have no shelter, the usual period is about 135 days; but salmon ova have been known to burst in about half that period, and to yield very healthy fish. Great care is of course necessary in handling the ova. The eggs manipulated at Huningue are all carefully examined on their arrival, when the bad ones are thrown out, and those that are good are counted and entered in a record. The ova are watched with great care, and from day to day all that become addled are removed. The applications for eggs, both from individuals and associations, are always a great deal more numerous than can be supplied; and before second applications can be

PISCICULTURE.

entertained, it is necessary for the parties to give a detailed account of how their former efforts succeeded. It may be interesting to note, as regards

the cost of pisciculture at Huningue, that the most expensive fish is the ombre chevalier. Of some species, as many as sixty or seventy per cent. of the

Reception-hall for Fish-eggs at Huningue.

eggs are lost. The general calculation, however, is twelve living fish for a penny.

The total number of all kinds of fishes distributed from Huningue, during the first ten years was upwards of 110 millions! See HUNINGUE.

A very successful effort in pisciculture has been carried out in connection with the salmon-fisheries of the river Tay. At Stormontfield, near Perth, a series of ponds have been constructed, and a range of breeding-boxes laid down capable of receiving 300,000 eggs; and in a large addition to their rental, the proprietors of the Tay fisheries are reaping the reward of their enterprise. The operations at Stormontfield were begun in 1853, and from the end of November till the end of December, 300,000 ova were deposited, and these coming to life in April 1854, remained in the boxes and ponds one half for one year, and the other moiety for two years before they assumed the scales of the smolt, and were seized with the migratory instinct. See SALMON. Every two years since the completion of the ponds, a brood has been obtained, and upwards of one million of salmon have by means of these ponds been added to the fish-stock of the river Tay, so as considerably to enhance the value of the fisheries. Another pond (there was only one originally) has now been added to the suite, for the purpose of holding the second-year parrs, so that a brood of 300,000 will now be obtained annually. At several other places in Scotland, the artificial system is being introduced as an adjunct to the natural breeding resources of different rivers.

The art of pisciculture has also been introduced into Ireland, at the fisheries of Loughs Mask and Carra, by the Messrs Ashworth, who have obtained excellent practical results from their enterprise. These lochs contain an area of water equal to thirty-five acres; and a communication with the sea having been opened, they now teem with salmon; and the proprietors are confident that it is as easy and as profitable to cultivate salmon as sheep. The latest experiment in fish-culture with the salmon consists in the introduction of that fish into Australia and Tasmania. Impregnated eggs carefully packed in ice were sent out in a fast-sailing ship, and were at once transferred to a suitable river, where (1864) they burst into life, with every prospect of becoming naturalised in that vast continent.

A series of piscicultural experiments have been very successfully carried on in the upper waters of the Thames, and the salmon has been bred along with various other fishes, upwards of 120,000 fishes having been added to the stock of the river; but the success of this experiment yet remains to be determined, as it is not certain whether the salmon will be able to penetrate to the sea, in consequence of the lower Thames being used as the sewer of London.

This branch of pisciculture has begun to be prosecuted to some extent in several countries of Europe, and has been deemed of sufficient importance to demand the attention of governments. It is probable that the attention turned to the whole subject of pisciculture, and the example of the transportation of salmon to Australia, may lead to

the introduction of valuable kinds of fishes into waters where they are now unknown. The grayling has thus already been introduced into the Clyde and Tweed. There is no apparent reason why every valuable fresh-water fish of Europe should not be plentiful in Britain.

The French government are now extending the system of artificial culture to some kinds of sea-fish and to many of the larger crustaceans. See OYSTER. At Comacchio (q. v.), on the Adriatic, a curious industry is carried on in the cultivation of eels; and in the Bay of Aiguillon, there is an ancient mussel-farm in which large quantities of that shell-fish are annually grown from the seed, and turned to

very profitable account. There is no practical difficulty, it is said, in rendering an acre of water as productive as an acre of land.

PISCINA, the large basin (or pond) in the Roman thermae, containing tepid water, in which the bather might swim.

PISCINA, a shallow stone basin with a drain (usually leading directly to the earth), in Roman Catholic churches, in which the priest washes his hands, and for rinsing the chalice at the celebration of the mass. In England, it is almost invariably placed on the south side of the choir, at a convenient height.

Piscina, Warmington.

PISE, a kind of work used instead of brick, &c., for the walls of cottages. It consists of loam or earth hard rammed into framing, which, when dry, forms a wall.

PISEK (Boh. *Pisek*, sand), a small town of Bohemia, on the right bank of the Wottawa, an affluent of the Moldau, stands on a sandy plain (from which circumstance it probably received its name) 55 miles south-south-west of Prague. The town is old, and contains the remains of a royal castle. Among other institutions are a school of arts and a high school. The manufactures are woollen and cotton fabrics, iron wire, and musical instruments. Pop. 6100.

PISHAMIN. See DATE PLUM.

PI'SOLITE (Gr. pea-stone), a concretionary limestone, differing from oolite in the particles being as large as pease.

PISTA'CIA, a genus of trees of the natural order *Anacardiaceæ*, having dioecious flowers without petals, and a dry drupe with a bony stone.—The PISTACIA or PISTACHIO TREE (*P. vera*) is a small tree of about 20 feet high, a native of Persia and Syria, but now cultivated in all parts of the south of Europe and North of Africa, and in many places naturalised. It has pinnate leaves, with about two pair of ovate leaflets, and an odd one; flowers in racemes; fruit ovate, and about the size of an olive. The stone or nut splits into two valves when ripe; the kernel, which is of a bright green colour, is very oleaginous, of a delicate flavour, and in its properties very much resembles the sweet almond. In the south of Europe and in the East, *Pistachio nuts* are much esteemed; but as they very readily become rancid, they are little exported to other countries. They are sometimes called *Green Almonds*. Oil is expressed from them for culinary and other uses. In cultivation, one male tree is allowed to

five or six fertile ones. The tree produces flowers and even fruit readily enough in the south of England, but the summers are not warm enough to ripen the fruit, and the tree is apt to be destroyed by a severe frost.—The MASTIC TREE, or LENTISK (*P. lentiscus*), yields the gum-resin called Mastic (q. v.). It is a native of the countries around the Mediterranean.—The TURPENTINE TREE (*P. teredintus*) yields the Turpentine (q. v.) known in commerce as *Cyprus Turpentine*, *Chian Turpentine*, or *Scio Turpentine*, which is of a consistency somewhat like that of honey, a greenish-yellow colour, an agreeable odour, and a mild taste, and in its properties resembles the turpentine of the Coniferae, but is free from acidity. It is obtained by making incisions in the trees, and placing stones for the turpentine to flow upon, from which it is scraped in the morning, before it is liquefied again by the heat of the sun. The tree is about 30 or 35 feet in height; and has pinnate leaves, of about three pair of leaflets and an odd one; the flowers in compound racemes, the fruit nearly globular. The kernel of the fruit is oleaginous and pleasant.—The BAYON TREE (*P. Atlantica*), a round-headed tree of about 40 feet in height, a native of the north of Africa, produces a fruit much used by the Arabs; and a gum-resin of pleasant aromatic smell and agreeable taste, which exudes from its stem and branches, is chewed to clean the teeth and impart a pleasant smell to the breath.—The fragrant oil of the kernels of *P. oleosa*, a native of Cochin China, is used by the people of that country to impart a perfume to ointments.

PISTIL, in Botany, the female organ of fructification in phanerogamous plants; that part of the Flower (q. v.) which, after flowering is over, is developed into the fruit. There is sometimes one pistil in a flower, sometimes more; in some flowers, which have numerous pistils, they form a number of whorls, one within another, sometimes on an elevated receptacle or elongated axis, or, more rarely, they are spirally arranged. In every case, the centre of the flower is occupied by the pistil or pistils, if present. See FLOWER. A pistil is either formed of a single Carpel (q. v.), as is the case when there are numerous pistils, or of several carpels combined; and the number of carpels of which the pistil is formed is often indicated by the number of the cells of the germen, or by its lobes or angles. The pistil usually consists of a Germen (q. v.) or ovary, in which the Ovules (q. v.) are contained, and which is surmounted by a stigma, either immediately or through the intervention of a style; but in Gymnogens (q. v.), there is neither germen, style, nor stigma, the female organs of fructification being mere naked ovules. The germen is always the lowest part of the pistil. The stigma exhibits an endless variety of forms, and is adapted to the reception and retention of the pollen grains requisite for fecundation, partly by the roughness of its surface—which is of a somewhat lax cellular tissue, covered with projecting cells, often in the form of minute warts, and often elongated into hairs—and partly by the secretion of a viscous fluid. The stigma when not sessile—or seated immediately on the germen—is supported by the style, which rises from the germen, and on the top of which the stigma is generally placed. The style is sometimes very long and slender, sometimes very short; the germen sometimes passes imperceptibly into the style, and sometimes the style rises from it abruptly; and similar differences appear in the relations of the style and stigma; the stigma, however, may be regarded as always an expansion of the top of the style, although it is sometimes, but rarely, situated on one or both sides of the style, beneath its summit. In like

PISTILLIUM - PISTOLE

known for peculiar modifications taking place in the growth of the germen, the style sometimes seems to arise from beneath the ovary, or even from

Pistils

1, Section of flower of a species of *Pelicanus*, showing the pistil (cut open); numerous ovules attached to a free central placenta. 2, Section of flower of *Camellia*, with ovules attached, showing base of the style, and the stigma. 3, Pistil of the Strawberry, consisting of several carpels combined, the style very short and thick, the stigma divided. 4, Section of the ovary of a Lily. 5, Section of flower of *Cherry*, showing pistil of two separate carpels, only one of which seems to participate in fruit. 6, Pistil of *Pea*, opened; a, ovule; b, ovary; c, stigma; d, style. 7, Pistil of *Pea*, opened; a, ovule; b, ovary; c, stigma; d, style. 8, Pistil of *Pea*, opened; a, ovule; b, ovary; c, stigma; d, style. 9, Pistil of *Pea*, opened; a, ovule; b, ovary; c, stigma; d, style. 10, Pistil of *Pea*, opened; a, ovule; b, ovary; c, stigma; d, style.

We have, but it always rises from what is, structurally considered, the real axis of the germen. When several carpels are united to form one germen, they are sometimes again separated in their styles and more frequently in their stigmas, so that one germen bears several styles, or the style divides at some point above the germen, or one style is crowned by a number of stigmas. The style is usually cylindrical, and when this is not the case, it is often owing to the combination of several styles into one, although sometimes the style is flat and even petal-like. It is traversed throughout its whole length by a canal, which, however, is in general partly filled up by cells projecting from its sides, and often also by very slender tubes extending in the direction of its length; the function of the canal, to which in some way or other the enclosed slender tubes are subservient, being to bring about the connection between the pollen and the ovules for fecundation (q. v.). The length of the style is adapted to the ready fecundation of the ovules, being such that the pollen may most easily reach the stigma; and in erect flowers, the styles are usually shorter than the stamens; in drooping flowers, they are longer than the stamens. After flowering is over, when fecundation has taken place, the *pericarpium* of the ovules closes, the germen enlarges and ripens into the fruit, whilst each ovule is developed into a seed. The style and stigma meanwhile either fall off, or remain and dry up, or they increase in size, and are changed into various kinds of appendages of the fruit, as feathery awns, hooks, &c.

PISTILLIDIUM, in Botany, a term which, along with *Androecium* (q. v.), must be regarded as provisional, and as expressive of an opinion probable, but not yet ascertained to be true. The evidence in favour of it, however, seems continually to increase, and the great probability is more and

more generally acknowledged. The pistillidium is an organ of cryptogamous plants, supposed to perform functions in fecundation analogous to those of the pistil in phanerogamous plants. It consists of a perianth-like body, the *perigonium*, *theca*, or *gynaeum*, and containing stamens (q. v.), by which the species is propagated. These stamens are very various in their forms and in the situations which they occupy in different orders and genera; being sometimes immersed in the substance of the plant, sometimes distinct from it, sometimes sessile, sometimes stalked, &c. See the articles on the different cryptogamous orders.

PISTOTA (anc. *Pistoria*), a manufacturing town of Italy, in the province of Florence, and 21 miles by railway north-west of the city of that name, stands on a gentle rising ground at the foot of the Apennines. It is well built; its streets are thoroughly Tuscan, and it is surrounded by lofty and well-preserved walls. The chief buildings are the cathedral, built at various times, and containing a number of good pictures; several old and interesting palaces, and a number of churches, some of which are of importance in the history of medieval architecture and sculpture. The principal manufactures are iron and steel wares, and paper. Pop. about 12,000.

PISTOL is the smallest description of fire-arm, and is intended to be used with one hand only. Pistols vary in size from the delicate salmon-pistol, often

Ancient Pistols:

1, Long Wheel-lock Pistol; 2, Pocket Wheel-lock Pistol.—Temple Elizabeth.—from *Vanderg's Costume in England*.

not six inches long, to the horse-pistol, which may measure 15 inches, and sometimes even two feet. They are carried in holsters at the saddle-bow, in the belt, or in the pocket. Every cavalry soldier

Modern Pistol.

should have pistols, for a fire-arm is often of great service for personal defence, and almost indispensable in giving an alarm or signal. Sailors, when boarding an enemy's ship, carry each two in their waistbelts.

As early as the reign of Henry VIII. the English cavalry carried clumsy pistols called 'dags.' The latest improvement on the pistol is the Revolver (q. v.).

PISTOLE, the name given to certain gold coins current in Spain, Italy, and several parts of Germany. The pistole was first used in Spain, and was originally equivalent to about 11 old French livres, but till 1725 it was merely an irregular piece of gold. From this time till 1772 its value was 17s. 1d. sterling; but it was after this date decreased till it reached its present value of 60 reals, or 16s. 2d. sterling. Gold coins of 4, 2, 1, and 1/2 pistoles are at the present day current in Spain. The Italian pistoles are also gold coins and vary considerably in value; that of Rome =

13s. 9d.; of Venice = 16s. 2½d.; of Florence and Parma = 16s. 10½d.; and the old coin of Piedmont = 41, 2s. 7½d., or 24 old liras. These will, however, in all probability, be soon superseded by the new pistole of 20 liras, or francs, which is equivalent to 16s. sterling. Gold coins of this name are current in Hesse-Cassel, Switzerland, Brunswick, and Hamburg, but are in most cases merely convenient multiples of the ordinary thaler and gulden.

PISUM. See **PEA**.

PIT, in Gardening, is an excavation in the ground, intended to be covered by a Frame (q. v.), and to afford protection to tender plants in winter, or for the forcing of vegetables, fruits, &c. Pits are often walled on all sides, although, in many cottage gardens, excellent use is made of pits which are mere excavations. The walls are often raised above the ground, particularly the back wall, the more readily to give slope to the glazed frame. A pit in which no artificial heat is supplied, is called a *cold pit*; but when forcing is intended, flued pits are often used. Artificial heat is sometimes also given by means of fermenting matter. The ventilation of pits, as much as the weather will permit, is of the greatest importance.

PIT'A-HEMP, one of the names of the Agave or Aloe fibre. See **AGAVE**.

PIT'AKA (literally, 'basket') is, with the Buddhists, a term denoting a division of their sacred literature, and occurs especially in combination with *tri*, 'three'; *tripitaka* meaning the three great divisions of their canonical works, the *Vinaya* (discipline), *Abhidharma* (metaphysics), and *Sūtra* (aphorisms in prose), and collectively, therefore, the whole Buddhist code. The term 'basket' was applied to these divisions, because the palm-leaves on which these works were written were kept in baskets, which thus became a part of the professional utensils of a Bhikshu, or religious mendicant.

PITCAIRN ISLAND, a solitary island in the Pacific Ocean, lying at the south-eastern corner of the great Polynesian Archipelago, in lat. 25° 3' 6" S., and long. 130° 6' W. Its length (2½ miles) is about twice its breadth, and the total content is approximately 1½ square miles; so that, except from its being the only station (with the exception of the Gambier Islands) between the South American coast and Otaheite at which fresh water can be procured, it would be too insignificant to deserve notice, were it not for the manner in which it was colonised. The island is wholly surrounded by rocks; it has no harbour, and its soil is not very fertile. It was occupied in 1790 by the mutineers of the *Bounty* (see **BLIGH, WILLIAM**), who, after touching at Toobonai, sailed for Tahiti, where they remained for some time. Christian, the leader of the mutineers, however, fearing pursuit, hastened their departure; and after leaving a number of their comrades who preferred to stay on the island, they brought off with them 18 natives, and sailed eastward, reaching P. I., where they took up their residence, and burned the *Bounty*. They numbered then 9 British sailors—for 16 of the sailors had preferred to remain at Tahiti, and of these, 14 were subsequently captured, and (September 1792) three of them executed—and 6 Tahitian men, with 12 women. It was impossible for concord to subsist in a band of such desperate character; and, in the course of the next ten years, all the Tahitian men, all the sailors, with the exception of Alexander Smith (who subsequently changed his name to John Adams), and several of the women, had died by violence or disease. From the time of their leaving Tahiti, nothing had been heard of them, and their fate was only known when an American, Captain

Folger, touched at P. I. in 1808, and on his return, reported his discovery to the British government; but no steps appear to have been taken by the latter. On September 17, 1814, a British vessel, the *Britain*, called at the island, and found old Adams still alive, commanding the respect and admiration of the whole little colony, by his exemplary conduct and fatherly care of them. Solitude had wrought a powerful change in Adams; and his endeavours to instil into the young minds of his old companions' descendants a correct sense of religion, had been crowned with complete success, for a more virtuous, amiable, and religious community than these islanders, had never been seen. They were visited by British vessels in 1825 and 1830, and the reports transmitted concerning them were fully corroborative of the previous accounts; but, in 1831, their numbers (87) had become too great for the island, and at their own request, they were transported to Tahiti in the *Lucy Ann*, by the British government. But, disgusted at the immorality of their Tahitian friends and relatives, they chartered a vessel, defraying the cost of it in great part with the copper bolts of the *Bounty*, and most of them returned to P. I. at the end of nine months. In 1839, being visited by Captain Elliot of H.M.S. *Fly*, they besought to be taken under the protection of Britain, on account of the annoyances to which they had been subjected by the lawless crews of some whale-ships which had called at the island; and, accordingly, Captain Elliot took possession of it in the name of Her Majesty, gave them a Union Jack, and recognised their self-elected magistrate as the responsible governor. He also drew up for them a code of laws, some of which are amusing from the subjects of which they treat, but the code was of great use to the simple islanders. From this time, they were frequently visited by European ships; and, in 1855, finding their numbers again too great for the island, they petitioned government to grant them the much more productive Norfolk Island, to which they were accordingly removed in 1856. In 1859, however, two families, numbering in all 17, returned to P. I., reducing the number of those left on Norfolk Island to 202. From their frequent intercourse with Europeans, the Pitcairn Islanders have, while still retaining their virtuous simplicity of character and cheerful hospitable disposition, acquired the manners and polish of civilised life, with its education and taste. They are passionately fond of music and dancing, the latter evidently a legacy from their maternal ancestry. The men are engaged in whaling and herding cattle, or in cultivating their gardens and plantations; while the women (who seem to be the more industrious class) attend to their families, manage the dairies, and take an occasional part in field-labour.

P. I. was first discovered by Carteret in 1767, and was named by him after one of his officers; but it was never visited by Europeans till taken possession of by the mutineers, though the latter found satisfactory indications of its having previously been occupied for a considerable period by savages probably from the neighbouring islands.

PITCH. The common kind of pitch is the black residue which remains after distilling wood-tar. See **TAR**. It is made extensively in Russia, Norway, and North America. It is a most useful material for protecting wood from the action of water, hence it is used for calking the seams, and coating the outsides of ships and boats; it is also applied to the inside of water-casks, and many similar uses. A variety of pitch is now obtained from the distillation of coal-tar, and another from bone-tar: the latter is said to be nearly equal in

value to that from wood, but coal-pitch wants the toughness which is one of the most valuable qualities of wood-pitch. It is, however, much used in making artificial asphalt for building and paving purposes, and for the black varnish used for coating iron-work to keep it from rusting. Pitch is solid at the ordinary temperature of our climate, but softens and melts with a small accession of heat.

PITCH, HARMONY. See **HARMONY** **PROPHET**.

PITCH, the degree of acuteness of musical sounds: A musical sound is produced by a series of vibrations depending on the rate at which they are produced; the greater the number of vibrations in a given time, the more acute or higher is the pitch. In stringed instruments the pitch is dependent on the length, the thickness, and the degree of tension of the strings; the shorter and thicker a string is, and the greater its tension, the higher is the pitch of the note. In wind instruments, where the notes are produced by the vibration of a column of air, as in the mouthpiece of an organ, the pitch is dependent on the length of the column set in motion; the shorter the column of air, the higher the pitch becomes.

The pitch of musical instruments is adjusted by means of a tuning-fork, consisting of two prongs springing out of a handle, so adjusted as to length that, when struck, a particular note is produced, that

note being C  in Britain, and A  in Germany.

It is obviously important to have a recognized standard of pitch, by which instruments and voices are to be regulated; but there is, unfortunately, not the uniformity that might be desired in the pitch in actual use. For a long time prior to 1855, concert-pitch had been gradually rising, to the detriment of the voices of public singers. The *Clarendon* fork, in use in 1699, made 439 vibrations per second, while in 1859, the number of vibrations had increased to 528. Mr. Hullah, in 1842, in the numerous classes instituted by him under the sanction of the Committee of Council on Education, found a necessity to secure a uniform standard of pitch, and adopted 512, which has an especial convenience as being a power of 2. The French Imperial government, in 1859, fixed on 522. In 1859, a Committee of the Society of Arts was appointed to consider the subject of a uniform musical pitch. Their deliberations lasted 12 months. Sir John Herschel, in a letter to the Committee, strongly recommended the number 512. It was agreed on all hands that the then existing opera-pitch of 546 was too high and painful to the singers of aspirant voices. The instrumental performers stated that they could lower the pitch to 528, but if they had to lower it to 512, some of them would have to purchase new instruments; and, in consequence of the unanimity of their representation, the Committee decided in favour of 512.

PITCHBLINDER, a mineral which is essentially oxide of Uranium (q. v.), with slight mixtures of other substances. Its colour is grayish-black or brownish-black. It is infusible before the blow-pipe, without the addition of borax, with which it fuses into a dull yellow glass.

PITCHER PLANT. See **NEREUS**.

PITCHSTONE, a name sometimes given to a variety of common Opal (q. v.), brown, black, gray, red, or of mixed colours; the latter more common than the rest, and the fracture less perfectly conchoidal. It occurs in several localities in the British Islands, in Saxony, &c. The same name is given to another mineral (viz. *Pechatol*), a variety

of Pique (q. v.), occurring as a rock in dikes which traverse strata or in overlying masses; compact, silty, or conglomeratic; silty concretions. It exhibits great variety of colour, and has a somewhat resinous appearance. It often contains numerous included crystals of felspar, and is then called *P. porphyry*.

PITCHERIM BEANS or **SASSAFRAN NUTS**, an occasional article of importation from South America, are the seed-beds of *Frederickia Pickers*, a tree of the same genus with the *Greenheart* (q. v.), growing on the banks of the Rio Negro and elsewhere in the rich alluvial parts of the basin of the Amazon. They are about an inch and a half long, and half an inch broad. They are much in request among chocolate manufacturers for flavouring chocolate, as a substitute for vanilla. They are sometimes called *Wild Nuts*, because of a resemblance to nutmeg in flavour. The name *Sassafras Nuts* is also due to the flavour, which approaches that of *Sassafras* bark, and the tree belongs to the same natural order with the *Sassafras* tree.

PITH (*Medulla*), the light cellular substance which occupies the centre of the stem and branches in Exogenous Plants (q. v.). In the earliest stage of a young stem or branch, it is entirely composed of pith and bark, by which alone, therefore, young buds are nourished; the vascular bundles of woody fibre appearing afterwards, and in these and shrubs, generally increasing, so as to constitute the greater part of the substance of the stem and branches, whilst the pith is ultimately reduced to a very small column in the centre. The pith, however, exists even in the most mature woody stem, and maintains its connection with the bark by means of *Medullary Rays*, analogous in their character to the pith itself, and which add even in the most compact wood, although much compressed by the woody layers, and in a transverse section appearing as mere lines. The medullary rays convey in the central parts of the stem the excretions of the bark necessary for their nourishment. P. is in general entirely composed of cellular tissue; vessels occurring in it only in a few plants. Its cells diminish in size from the centre towards the circumference. In a few plants, it exhibits cavities which have a regular arrangement; in many herbaceous plants of rank growth, large irregular cavities occur in it. The pith is immediately surrounded by a thin vascular layer called the *Medullary Sheath*, consisting chiefly of spiral vessels, which continue to exercise their functions during the life of the plant.

PITHECIA. See **SABU**.

PITHECUS. See **ORANG**.

PITON BARK. See **CASSIA BARK**.

PITRI (a Sanscrit word literally meaning father = Latin *pater*, in the plural *Pitres*, but in English translations from the Sanscrit usually Anglicized to *Pitris*, a name which, in a general sense, means the deceased ancestors of a race, but in the special sense in which it occurs in Hindu mythology, denotes an order of divine beings inhabiting celestial regions of their own, and receiving into their society the spirits of those mortals for whom the funeral rites (see **SHRADDHA**) have been duly performed. They include, therefore, collectively the names of the deceased ancestors; but the principal members of this order are beings of a different nature and origin. According to Manu, they were the sons of Marichi, Atri, Angiras, and the other Rishis or sages produced by Manu, the son of Brahma; and from them named the gods, demons, and men. According to several Puranas (q. v.), however, the first Pitris were the sons of the gods; and to reconcile this discrepancy, a legend relates

that the gods having offended Brahmā by neglecting to worship him, were cursed by him to become fools; but upon their repentance, he directed them to apply to their sons for instruction. Being taught accordingly the rites of expiation and penance by their sons, they addressed the latter as fathers, whence the sons of the gods were the first Pitṛis (fathers). See Wilson's *Viṣṇu-Purāṇa*. Manu enumerates various classes of Pitṛis in defining those who were the ancestors of the gods, those who were the ancestors of the demons, and those from whom proceeded the four castes severally; but he adds, at the same time, that these are merely the principal classes, as their sons and grandsons indefinitely must likewise be considered as Pitṛis. The *Purāṇas* divide them generally into seven classes, three of which are without form, or composed of intellectual, not elementary substance, and assuming what forms they please, while the four other classes are corporeal. In the enumeration, however, of these classes the *Purāṇas* differ. The Pitṛis reside in a world of their own, called Pitṛi-loka, which is sometimes supposed to be the moon; according to the *Purāṇas*, it is below the paradise of Indra, and is also the abode of the souls of devout Brahmans. The time at which the Pitṛis are to be worshipped, the libations which they are to receive, the benefit which they derive from them, and the boons which they confer on the worshipper, are all minutely described in the *Purāṇas*. See ŚRĀDDHA. A song of the Pitṛis, as given by the *Viṣṇu-Purāṇa*, may convey an idea of the importance attributed to this worship, and of the manner in which the Brahmans turned it to their profit. It runs as follows: 'That enlightened individual who begrudges not his wealth, but presents us with cakes, shall be born in a distinguished family. Prosperous and affluent shall that man ever be who, in honour of us, gives to the Brahmans, if he is wealthy, jewels, clothes, lands, conveyances, wealth, or any valuable presents; or who, with faith and humility, entertains them with food, according to his means, at proper seasons. If he cannot afford to give them dressed food, he must, in proportion to his ability, present them with unboiled grain, or such gifts, however trifling, as he can bestow. Should he be utterly unable even to do this, he must give to some eminent Brahman, bowing at the same time before him, sesamum seeds, adhering to the tips of his fingers, and sprinkle water to us, from the palms of his hands, upon the ground; or he must gather, as he may, fodder for a day, and give it to a cow; by which he will, if firm in faith, yield us satisfaction. If nothing of this kind is practicable, he must go to a forest, and lift up his arms to the sun and other regents of the spheres, and say aloud: "I have no money, nor property, nor grain, nor any thing whatever fit for an ancestral offering; bowing therefore to my ancestors, I hope the progenitors will be satisfied with these arms tossed up in the air in devotion." See Wilson's *Viṣṇu-Purāṇa*.

PITT, WILLIAM, the second son of the Earl of Chatham and of Lady Hester Grenville, daughter of the Countess Temple, was born on the 28th May 1759. His genius and ambition displayed themselves with an almost unexampled precocity. 'The fineness of William's mind,' his mother writes of him, when he was but twelve years old, 'makes him enjoy with the greatest pleasure what would be above the reach of any other creature of his small age.' Owing to the excessive delicacy of his constitution, it was found impossible to educate him at a public school. His studies were, however, prosecuted at home with vigour and success. In 1773, he was sent to the university of Cambridge, where his knowledge of the classics seems to have

astonished veteran critics. To modern literature, he appears to have been utterly indifferent—he knew no continental language except French, and that very imperfectly. Among English poets, he liked Milton best; the debate in *Pandemonium* being his favourite passage. In 1780, P. was called to the bar. He took chambers in Lincoln's Inn, and joined the western circuit. A general election having taken place in the autumn of the same year, he stood for the university of Cambridge; but he was at the bottom of the poll. Through the influence, however, of the Duke of Rutland, he obtained a seat in parliament as member for Appleby. Lord North was now prime minister. The Opposition consisted of two parties; one being led by Rockingham and Fox, the other by Lord Shelburne. The latter consisted chiefly of the old followers of Chatham; and to this party Pitt naturally became attached. On 26th February 1781, he made his first speech in parliament. It was in favour of Burke's plan of economical reform, and was a splendid success. 'It is not a chip of the old block,' said Burke; 'it is the old block himself.' Shortly before the meeting of parliament, in the autumn of 1781, the news arrived of the surrender of Cornwallis and his army. In the debate on the address, P. spoke with even more energy and brilliancy than on any former occasion. No one was so loud in eulogy as Henry Dundas, Lord Advocate for Scotland; and from this night dates a connection between him and P., which was only broken by death. After several defeats, the ministry resigned, and Rockingham was called on to construct a cabinet. P. was offered the vice-treasuryship of Ireland; but he declined to accept a position which did not confer a seat in the cabinet. On 7th May 1782, he made his first motion for a reform in the representation of the people; which motion was lost by only 20 votes in a house of more than 300 members. The reformers never again had so good a division till 1831. At the end of three months after his accession to office, Rockingham died; Lord Shelburne succeeded to the head of the treasury; and P., at the age of 23, became Chancellor of the Exchequer. In opposition to the government, there was then formed a coalition emphatically known as 'The Coalition.' On Lord Shelburne's resignation in 1783, the king himself, who hated the Coalition, tried to persuade P. to take the helm of affairs, but he resolutely declined. The Duke of Portland succeeded, with Fox and North as Secretaries of State. P., from the Opposition benches, brought a second time the question of parliamentary reform before the House. His motion was lost by 293 votes to 149. On the prorogation, he visited the continent for the first and last time. In 1783, the ministry having been defeated on a motion for transferring the government of India to parliament, P. became First Lord of the Treasury and Chancellor of the Exchequer. But parliament was dead against him: between 17th December 1783 and 8th March 1784 he was beaten in sixteen divisions. The nation, however, was in his favour; both on account of his policy, and from admiration of his private character. Pecuniary disinterestedness is what all can comprehend; and even when known to be overwhelmed with debt, when millions were passing through his hands, when the greatest men in the land were soliciting him for honours, no one ever dared to accuse him of touching unlawful gain. At the general election in 1784, 160 supporters of the Coalition lost their seats, P. himself heading the poll for the university of Cambridge. He was then, at 25 years old, the most powerful subject that England had seen for many generations. He ruled absolutely over the cabinet, and was at once the

records of the sovereignty of the parliament, and of his nation, and from this date, the life of P. became the history of England and of the world for seventeen eventful years, he held his great position without a break. In 1794, he concluded a co-convention for the East India Company. In that, he carried through a commercial treaty with France on liberal principles. In the same year, he concluded a new sinking fund, a scheme which afterwards has shown to be wrong in principle, though it was long shrouded with favour by the nation. To exceptions which were now begun to the abolition of the slave-trade, he gave little time as his eloquence and power. In 1798-1799, he engaged against Fox the right of parliament to supply the temporary deficit of royal authority imposed by the incapacity of the king. The two 1799 saw the beginning of the great war with France. Antislavery differ as to the name. Fox, however, certain that P.'s military administration was eminently successful. But no longer could doubt his spirit. When a new French victory, a rebellion in Ireland, a mutiny in the fleet, and a panic in the city had spread dismay through the nation, P. from his place in parliament poured out the language of unshakable hope and cheerful resolution. Disaster ahead was regularly followed by triumph at home, until at last it had no longer an opposition to encounter. In 1801, he effected the union with Ireland. It was one of his schemes to relieve the Roman Catholic life from civil disabilities, and to grant a public allowance to their clergy; but the obstinacy of a king frustrated this design. Chagrined by this, P. resigned office in 1801. He was succeeded by Mr. Addington, to whom for a while he lent his support. In 1804, he returned again to be head of the treasury, which position he continued to hold till his death on 23d January 1806. The event was doubtless hastened by the stupendous success of Napoleon. The peculiar look which shows during the last days of his life was pathetically termed by Widdowson 'the Austerlitz look.' A disappointed aide of his friend, Lord Melville, is reported greatly to have hastened his end. It gave him, he said in parliament, a deep pang. His voice faltered as he uttered the word, and it seemed as if the name of iron were about to shatter. 'He had,' says Maesley, 'a number of great talents, great intentions, and liberal opinions; . . . but equal to surprising and terrible emergencies, and almost equal to emergencies in our grievous, both on the side of weakness and on the side of violence.' 'He who, now ever lived, we may ask, who, placed in such circumstances as P. would not often have justly served? His policy was liberal beyond his era; at least he wished it to be so, although he was often obliged to yield to the prejudices of his sovereign. He resigned office because he could not see Catholic emancipation. He laid before the king unanswerable reasons for abolishing the Test Act. He was more deeply imbued with the doctrine of free-trade than either Fox or Grey. It cannot need be denied that he was addicted to port-wine, and that he died overburdened with debts; parliament voting £40,000 to his creditors. High as his character stands, it would have stood even higher had he entered the vortex of fragility to that of Austerlitz.' See *Life of Pitt* by Lord Stanhope (1801); also Lord Maesley's *Biographies* (1806). In the former work, vol. ii., p. 195, will be found a valuable criticism on Maesley's account.

PITTAUGH, one of the 'Seven Wise Men' of New Brunswick, was born at Mitylene, in the island of Lesbos, about the middle of the 7th c. B.C. The

incidents of his life do not rest on a very secure historical basis, but he is by no means to be regarded as a merely traditional personage. We may feel quite certain that his career and character were substantially what later history represents them. About 612 B.C., in conjunction with the brothers of Alcibiades the poet, he overthrew the 'tyrant' Melancomus, and put him to death. He next figures in the conflict between the Lesbian and the Athenians for the possession of Sigeion in the Troad, and displayed as much valor in the battlefield as Alcibiades did elsewhere. His overthrow, the Mitylenians were so pleased with his deeds of prowess that they gave him a portion of the city-territory, which he dedicated to sacred use, and which was known long after as the 'Mitylenian field.' Meanwhile, the civil struggle did not cease; the democratic party, however, much represented by a series of popular tyrants, were in the ascendant, and the oligarchic aristocrats, at the head of whom was Alcibiades, were finally banished. It was subsequently chosen Hecataeus, 600 B.C., to prevent the turbulent exiles from returning to Mitylene, and ruled absolutely with great success for ten years, after which he voluntarily resigned his power, and withdrew into humbler retirement. He died in 550 B.C. Many of the anecdotes preserved by tradition concerning P. are probably apocryphal; but they all attribute to him the same characteristics—great moral sagacity, a contempt of outward pomp, and a plain practical order standing. His favorite maxim, *ἄσκησις καὶ νῆστις* ('Know the fitting moment'), may be recommended to all statesmen and politicians. To P. is also ascribed the saying which has so often been verified in actual history, *ἡλιπύος αὐτῷ καὶ καὶ καὶ* ('It is a misfortune to be eminent'). Of his 600 dactylic verses, only four are extant, and these prove that he was strongly impressed with the falsehood and insincerity of men. See *Strabo's Geographical Poets* (Grosvenor Edition, &c., 1897).

PITTOSPORACEÆ, a natural order of exogenous plants, allied to *Vinaceæ* (the Vine, &c.), and containing nearly 100 known species of trees and shrubs, chiefly Australian, although a few are natives of different parts of Asia, Africa, and the islands of the Pacific. To this order belongs the genus *Banksia* (q.v.). The genus *Silphium* also deserves notice, as containing some of our most beautiful green-house plants.

PITTSBURG, a city of Pennsylvania, U.S. of America, at the confluence of the Allegheny and Monongahela rivers, at the head of the Ohio, lat. 40° 20' 34" N., long. 80° 2' 38" W. It is situated among some of the richest deposits of bituminous coal and iron in America, supplying coal to the extent of 1,500,000 tons a year to the whole Missouri Valley, and having 63 mining companies, 23 iron and steel works, 16 foundries, extensive machine-shops, manufactures of steam-boilers, engines, nails, spikes, rivets, filer, wire, fasteners for mines, &c. There are also paper-milling and rolling mills, 6 cotton-mills, wool-card and glass works. The numerous foundries and factories fill the atmosphere with smoke, and have given P. the name of the Birmingham of America. It is connected by steamboats with the whole Mississippi Valley, and by railways and roads with Philadelphia and Cleveland. Among its public buildings are a fine court-house, the largest Roman Catholic cathedral in the country, 115 churches, railway, aqueduct, and other bridges, United States Arsenal, schools and colleges, western state penitentiary, &c. There are 10 or 12 newspapers, 2 German. P. occupies the site of Fort Pitt, and the older French

Fort Duquesne, in an expedition against which, the British general, Braddock, was defeated in 1755, by an allied force of French and Indians. It was taken, on a third attempt, by General Forbes in 1758. The city was chartered in 1816; in 1845, it was nearly destroyed by fire. The population in 1840 was 21,115; in 1860, 49,220; or, including the towns which cluster around it, 115,000.

PITTSFIELD, a village in Massachusetts, U.S. of America, on the Western Railway, 151 miles west of Boston, and the terminus of the Housatonic and Pittsfield Railway. It has two cotton and nine woollen factories, various manufactories, the Berkshire Medical College, two banks, nine churches, &c. Pop. (1860) 8045.

PITUITARY BODY, a small reddish-gray mass of an oval form, weighing from six to ten grains, and situated on the sella turcica of the sphenoid bone, on the floor of the cavity of the skull. It is very vascular, and in its structure it resembles the ductless glands. In the fœtus, it is relatively larger than in the adult, and contains a cavity which subsequently disappears. It derives its name from its having been formerly supposed to secrete the fluid which (as we now know) is yielded by the Schneiderian or pituitary membrane of the nostrils. Its function is not known.

PITYRIASIS (from the Greek word *pityron*, bran) is the term given to one of the squamous or scaly diseases of the skin, in which there is a continual throwing off of bran-like scales of epidermis, which are renewed as fast as they are lost. It may occur upon any part of the body, giving rise to brown patches, in which there are sensations of itching, tingling, or pricking. It is more easily cured than the other scaly diseases, and its removal can generally be effected by the frequent use of the warm bath; or, if it fails, recourse may be had to alkaline or sulphur baths; due attention being at the same time paid to the general health. It sometimes occurs on the scalp, when it is known as *dandruff*, and must be treated with weak alkaline lotions, or, if these fail, with tar ointment, provided there is no inflammation. There is a variety known as *Pityriasis versicolor*, which is probably due to the presence of a parasitic fungus, the *Microsporon furfurans*; but whether the fungus is the positive cause of the disease, or only an attendant on it, finding a suitable nidus in the diseased epidermis, is not certain. This variety may be detected by a microscopic examination of the exfoliated scales, when the spores and filaments of the fungus will be detected. The treatment of this affection must be solely local. Dr Watson mentions a case which yielded at once to a couple of sulphur baths. Probably the best remedy is the application of a saturated watery solution of sulphurous acid gas, or of one of the sulphites dissolved in diluted vinegar.

PIÙ (in Ital. more), as a musical term, when prefixed to another word, intensifies its meaning—e. g., *pil mosso*, with more movement.

PIUS, the name of nine among the Roman pontiffs, of whom the following only appear to call for particular notice.—**PIUS II.**, originally known as *Æneas Sylvius*, was a member of the noble family of Piccolomini, and was born (1405) at Corsignano, in the duchy of Siena. His early life was not free from serious irregularities, but he made amends by his subsequent decorous conduct; and his eminent abilities as a canonist led to his being employed, when but 26 years of age, as secretary of the Cardinal of Fermo, in a post of the highest confidence at the council of Basel (q. v.). He was intrusted by that council—the views of which, in its conflict with the pope, he fully shared—

in several commissions of great importance; and on the election of the antipope, Felix V., *Æneas Sylvius* was chosen as his secretary. But having been sent by him as ambassador to the Emperor Frederick III., he was induced to accept office in the imperial court, and served on several embassies and other missions of importance on behalf of the emperor. In the difficulties between Frederick and the Pope Eugenius IV., which arose after the council of Florence, *Æneas* conducted so skillfully a negotiation with which he was intrusted, that the pope was induced to retain him in his own court, in the capacity of secretary. His views of church matters having undergone a considerable change, he continued in equal favour under the successor of Eugenius, Nicholas V., 1447; and under Callistus III., he was elevated to the cardinalate. On the death of Callistus in 1458, he was elected pope, and took the name of Pius II. His pontificate was embarrassed by some contests on German affairs, but it is chiefly rendered memorable by the sustained efforts which P.—the first in this policy of a long line of pontiffs, to whom the public security of Europe owes a deep obligation—made to organise an armed confederation of Christian princes to resist the progress of the Turkish arms. This organisation, however, for a long time did not lead to any considerable results. P. died, August 14, 1461. The literary reputation of the scholar, *Æneas Sylvius*, has partially eclipsed the historical fame of the Pope Pius. He was one of the most eminent scholars of his age. His works were published at Basel (1 vol. fol., 1551), but many of his works are not included in that edition. They consist chiefly of histories, or historical dissertations and materials of history; but the most interesting portion of his collected works are his letters, which are very numerous, and full of details, characteristic as well of the writer as of the age. The same may be said of a biographical commentary, which is in truth an autobiography, being chiefly written from his own dictation, by his secretary, John Gohedius, published at Frankfort in 1614. See Voight's *Life of Pius* (Berl. 1856).—**PIUS IV.**, Giovanni Angelo Medici, uncle of Saint Carlo Borromeo, deserves to be noticed from his connection with the celebrated creed known under his name. He was elected in 1560; and his pontificate is chiefly memorable as that in which the protracted deliberations of the Council of Trent (q. v.) were brought to a close. P. had the duty, in December 1563, of issuing the bull confirmatory of its decrees. The well-known creed called the Creed of Pius IV., and sometimes the Tridentine Creed, was issued by P. IV. as an embodiment of all the doctrines defined in that council. P. died, December 8, 1565, in the arms of his nephew, Carlo Borromeo.—**PIUS V.**, a saint of the Roman Catholic Church, originally named Michele Ghisleri, was born of poor parents, in the village of Bosco, near Alessandria in 1504, and at the age of fourteen, entered the Dominican order. His eminent merits were recognised by Paul IV., who named him Bishop of Sata in 1556, and cardinal in the following year. Of austere and mortified habits, he carried into his administration the same rigour which distinguished his personal conduct; and when appointed inquisitor-general for Lombardy, he employed the most rigorous measures in repressing the progress of the Reformation, which had begun to effect an entrance. He was afterwards translated to the see of Mondovì; and immediately after the death of Pius IV., he was chosen unanimously as his successor, January 8, 1566. P. carried into his pontifical life the same personal austerity and administrative rigour which he had evinced as a bishop. Applying to others the same

sales which he entered upon himself, by exacting a number of severe laws for the regulation of public morals, prohibiting ball games, suppressing prostitution, and suppressing a variety of popular but dissipated exhibitions. The Roman Inquisition, too, under his government, executed a severity of which no other pontificate has shown any example. He endeavoured to reform everywhere the discipline decreed by the Council of Trent; and the whole spirit of his pontificate is most strikingly exhibited in the decree by which he ordered the speedy publication of the celebrated bull, *In Christa Domini*, &c. It was an application to the 10th of the principles and the legislation of the Hildebrandian epoch. But the most momentous event of the pontificate of P. was the expedition which he organized, with Spain and Tuscany, against the Turks, and which resulted in the great naval encounter in the Gulf of Lepanto, on 25a October 1717. P. died in the following May, 1722. He was succeeded by Clement XI. in 1712.—Pius VI., originally named Angelo Braschi, was born at Cesena, December 27, 1717. He was selected by Benedict XIV. as his secretary; and under Clement XIII. he was named to several important appointments, which led finally, under Clement XIV., to his elevation to the pontificate. On the death of Clement XIV., Cardinal Braschi was chosen to succeed him, February 28, 1775. The conflict with the civil power in the various states of Europe, in which, from the days of Innocent XI., the Roman see had been almost incessantly involved to a greater or less degree, assumed under P. what may be called its complete and final development. His relations to the Emperor Joseph of Austria and the Grand Duke Leopold of Tuscany, who presided in the reformation of the religious orders, &c., were far from amiable. The internal administration of P., however, was enlightened and judicious. To him, Rome owes the drainage of the Pontine Marsh, the improvement of the port of Ancona, the completion of the church of St. Peter's, the foundation of the new Museum of the Vatican, and the general improvement and embellishment of the city. These and other similar projects were interrupted by the outbreak of the French Revolution. In 1793, a popular tumult at Rome, which was caused by the imprudence of a French political agent named De Bazeville, and which resulted in his death, gave the French Directory an opportunity of hostile demonstrations against the pope. In 1798, Bonaparte took possession of the fortress, and afterwards of the Marsh of Ancona, and by a threatened advance upon Rome, extorted from P., in the Treaty of Tolentino, the surrender of those provinces to the Cisalpine Republic, together with a heavy war contribution. The year 1797 was marked by a continuance of the same vexatious measures; and at length the Directory ordered the invasion of Rome. Another entered the city, February 10, 1798, and took possession of the castle of St. Angelo. P. was called on to renounce his temporal sovereignty, and on his refusal, was seized, February 20, and carried away to Soria, and afterwards to the celebrated Cortona, or Carthusian monastery, of Florence. On the threatened advance of the Austrian Russian army in the following year, he was transferred to Grenoble, and finally to Valence, in the Rhone, where, worn out by age and by the rigour of confinement, he died in August 1799, in the 81st year of his age and the 24th of his pontificate.—Pius VII., originally Gregory Barnabas Chiaramonte, was born at Cesena in 1742, he entered the Benedictine order at an early age, and was employed in teaching philosophy and theology at Parma, and afterwards at Rome. He was appointed bishop of Tivoli; and afterwards, being

created cardinal, was transferred to the see of Imola. After the death of Pius VI., Cardinal Chiaramonte was chosen his successor (March 18, 1800). Rome, which, up to this time, had been in the occupation of the French, was now restored to the papal authority, and in the July of that year, P. VII. returned into his capital; and in the following year, the French troops were definitively withdrawn from the papal territory, with the exception of the Legations. From that time forward, P. still assisted by his secretary of state, Cardinal Consalvi, was destined to occupy a prominent place in the political as well as the ecclesiastical affairs of Europe. Bonaparte had resolved to restore religion in France on the ancient basis of communion with Rome. With this view, he entered into negotiations with P. VII. for the establishment of a concordat suited to the new order of things which had arisen. These negotiations were conducted at Paris, and were attended with many difficulties and delays, until at length Cardinal Consalvi repaired in person to the conference, and, by his energy and decision, disentangled the complicated embarrassments in which it was involved. It was agreed at Paris, July 18, 1801; ratified in Rome, August 14, and published in Notre-Dame on Easter Sunday 1802. But simultaneously with the concordat, and as if forming part of the same arrangement, was published a note of what were called 'Organic Laws,' seriously affecting the discipline of the church on matters, on the clergy, and on public worship, which had never been submitted to P., and to which he not only had not assented, but to which he found himself compelled to offer every opposition. For the first year which succeeded the publication of the concordat, no occasion of difficulty arose; but conflict of principle was in the end inevitable. In 1804, Bonaparte having resolved on assuming the imperial crown, invited P. to come to Paris for the purpose of crowning him, and the pope, although with much hesitation, consented. He took advantage of his visit to demand the recall or modification of the articles, but without success; and although, during his visit to Paris, he was treated with great distinction and reverence, his relations with Napoleon from that date began to assume a less friendly character. The French emperor now proceeded from one petty outrage to another, until finally, in February 1805, the French troops, under General Molit, entered Rome, and took possession of the castle of St. Angelo; and on the 2d of April, a decree was issued annexing the provinces of Ancona, Fermo, Urbino, and Macerata to the kingdom of Italy. P., besides protesting against the usurpation, declared himself a prisoner in the French hands, and confined himself to his palace. The papers of the cardinal secretary were violently seized, and the pope was compelled to appoint a pro-secretary; and finally (May 17, 1806), the usurpation was consummated by a decree annexing Rome and all the remaining papal territory to the French empire. This was the signal for the pope abandoning his long-cherished policy of forbearance. On June 10, P. issued a bull of excommunication, directed (without naming Napoleon) against the perpetrators and abettors of the invasion of the rights and the territory of the holy see. Soon afterwards, the French general ordered the removal of the pope from Rome; and P., without offering any resistance beyond the declaration that he yielded to force, was removed, first to Florence, then to Grenoble, thence for a longer time to Savona, whence, in June 1812, he was finally transferred to Fontenbleau. During this prolonged captivity, P. firmly but quietly resented every effort to compel or seduce him from his policy. 44

Fontainebleau, he was treated with much external respect; and on Napoleon's return from the Russian campaign, in December 1812, orders were given that the cardinals, with certain exceptions, should be admitted to the presence of the pope. Under much pressure, both from the emperor himself—who is alleged by some to have acted with great rudeness, and even with personal violence—and from the ecclesiastics to whom the emperor confided his plans, P. was induced to sign a new concordat, an important provision of which was the recognition of the annexation of the Roman states to the empire. Having obtained the concession, Napoleon at once permitted the absent cardinals to return, and of these many remonstrated so earnestly against the concordat, that, on March 24, P. wrote to revoke his consent. Napoleon took no notice of the revocation; nor was it till after the disasters of 1813 that he began to seek an accommodation. P. refused to treat until he should be restored to Rome; and on January 22, 1814, orders were sent for his immediate return to his capital. Unattended by his cardinals, he was escorted to Italy, and remained at Cesena until the fatal campaign of the spring of 1814 placed Paris in the hands of the allies, when P. re-entered Rome amidst the gratulations of the people on May 24, 1814—a day since that time held sacred in the Roman calendar. During the Hundred Days, he was again compelled to leave Rome; but after the campaign of Waterloo, he finally resumed possession, which was undisturbed for the rest of his life, and which extended to the whole of the ancient territory, including the Legations.

The last years of his pontificate were devoted to measures of internal administration; and under the enlightened government of Cardinal Consalvi, were marked by much wisdom and moderation. But the administration chiefly by ecclesiastics and the secrecy of law procedure were resumed. P. repressed, too, with great vigour the disorder and brigandage which the long wars had introduced, and a whole village of notorious and incorrigible criminality, that of Somma, was razed to the ground in 1819. He was equally vigorous in repressing secret societies, especially that of the Carbonari (q. v.). The ecclesiastical measures of his later period were also of much importance. In 1814, he formally restored the suppressed order of the Jesuits (q. v.). In 1817 and the following years, he concluded concordats with Naples, with Prussia, Würtemberg, and other courts of Germany. In this and every other period of his life, P. was a model of gentleness, simplicity, benevolence, and Christian charity. In July 1823, having reached the patriarchal age of 81, he fell accidentally in his own apartments, and broke his thigh. Under the inflammation which ensued, he sunk gradually, and died August 20, 1823.

PIUS IX., GIOVANNI MARIA MASTAI FERRETTI, the reigning pontiff, was born at Sinigaglia, May 13, 1792. He was originally destined for the military profession, and was sent to Rome to enter the Noble Guard; but symptoms of an epileptic tendency led to his abandoning his intended profession, and entering an ecclesiastical seminary. He received holy orders, and for a time exercised his ministry in connection with several works of charity and benevolence in Rome; but was sent to South America as 'auditor' of Monsignor Mugé, the vicar-apostolic of Chili. On his return, he became domestic prelate of Leo XII., and President of the Ospizio of San Michele; and in 1829 he was named Archbishop of Spoleto, whence he was translated to Imola. He was soon afterwards sent to Naples as nuncio; and in 1840, was named cardinal, from which date

he continued to reside in his see. On the death of Gregory XVI. in 1846, Cardinal Mastai Ferretti was elected by acclamation to succeed him; and having learned, by long intercourse with the people of the Legations, the prevalence and the causes of discontent—which had been concealed under the repressive system of Gregory, following the direction of the Austrians, by whom a protectorate was exercised—he entered at once on a course of reforms, by which he hoped to establish the papal government on a popular, but yet on a firm basis. He resolved to extirpate all abuses of administration, financial as well as political, to withdraw as far as possible the restrictions of personal liberty, to secularise in many details the local administration, and to extend the rights of self-government as far as was compatible with the essential institutions of the Roman states. His first step to this end was to grant an amnesty; and this measure, however humane and necessary, had the unfortunate result of drawing together into the Roman states a body of men whom an unhappy experience of foreign exile had embittered against the existing order of things, and who had served in foreign revolutions, and in the secret councils which their position had necessitated, an apprenticeship to the arts of political intrigue. For a time, the reforming policy of P. carried with it the affections of the people; but he soon began to fall short of the expectations which he had created. The outbreak of the revolution of February 1848 precipitated the crisis of popular excitement and of popular discontent. Reform assumed the shape of revolution. In November of that year, Count Rossi, whom the pope had appointed as his minister, was assassinated; and violent demonstrations were daily employed to compel the pope's assent to measures which he repudiated. He was driven to confine himself a close prisoner in the Quirinal; and at length, in December, he fled secretly from Rome and established himself at Gaeta, a Neapolitan seaport, not far beyond the Roman frontier. A republic was proclaimed in Rome, the provisional heads of which proceeded to a complete and radical remodelling of the civil government of the state. P. from his exile addressed a remonstrance to the various sovereigns. In April 1849, a French expedition was sent to Civita Vecchia, which eventually advanced upon Rome, and after a siege of about 30 days took possession of that city, and established a French army of occupation within the Roman state. The pope's government was re-established, but he himself did not return till 1850, when, once again, he entered upon the administration. In consequence of the unsettled condition of Italy and the failure of many of his early measures of improvement, he declared himself unable to proceed with the reformations which he had contemplated. Since that time, his authority has been maintained without interruption; but it has always been believed that the discontent with the government still continues, and that, if the French army were withdrawn, violent changes would be imminent. In consequence of the war for the unification of Italy, the Legations, Ancona, and a considerable part of the papal territory southward in the direction of Rome, have been annexed to the kingdom of Italy, but P. has persistently refused to cede any portion or to enter into any compromise. His ecclesiastical administration has been very active, and has proceeded upon the strongest assumption of the right of independent action on the part of the church. In this view, he re-established the hierarchy in England, he sanctioned the establishment in Ireland of a Catholic university, and condemned the principles upon which the Queen's Colleges in that country were

unsubdued. He concluded with Austria a concordat much more favorable to church authority than the existing concordat laws had permitted. In 1834, he issued a decree propounding as a doctrine of the church the faith of the Immaculate Conception of the Blessed Virgin Mary (q. v.). In the internal administration of his states, notwithstanding the embarrased condition of finances produced by the curtailment of his territory, he has introduced many ameliorations, and has done much for the advancement and improvement of the city of Lima and of its institutions. In this he has been aided by the voluntary contributions of the several churches, as well in special acts as in the organization of the permanent tributes called *Pedro-pagos* (q. v.). His health has for some years been precarious, but with the exception of occasional interruptions, he continues (1864) to attend personally to all the public affairs, civil as well as ecclesiastical, of his government.

PIVOT, the point on which a body revolves, has a like signification in military affairs—the pivot-man being that soldier who marks the centre while a line is wheeling.

PIYĀDASI, one of the names of the celebrated King Aśoka. See BUDDHISM, INDIA. He is often designated by this name in inscriptions.

PIZARRO, *FRANCISCO*, the conqueror of Peru, was an illegitimate son of Gonzalo Pizarro, a colonel of infantry, and a soldier of some distinction. He was born at Truxillo, in Estremadura, Spain, about 1471. Of his youth, little is known, but it appears that he was wholly neglected by his parents, was taught neither to read nor write, and that in his youth his principal occupation was that of a swimmer. Abandoning this ungenial employment, he sought the port of Seville, and there embarked, to seek fortune in the New World. He was in Hispanola in 1510; later, he joined Balboa, and was with that cavalier when he crossed the Isthmus of Panama, and discovered the Pacific. In 1513, he was engaged to traffic with the natives on the shores of the newly-discovered ocean, but was afterwards chiefly employed in military service, in which he showed great bravery, resource, and power of endurance. About this time, when a fresh and powerful impulse was given to adventure by the splendid achievement of Cortes, rumours of a country far south, in which gold and silver were said to be as abundant as iron in Spain, reached Panama, and kindled P.'s ambition. He formed a sort of conspiracy with Diego de Almagro, an adventurer and a founding like himself, and Hernando Luque, an ecclesiastic; and with the funds which the three friends amassed, they were enabled to fit out a small expedition, of which P. took command. In November 1524, he set sail southward, but went no further than Quetzala Point. Making an agreement (dated March 10, 1526), that all lands, treasures, vessels, &c., that should be discovered, were to be equally divided between them, the three friends, P., Almagro, and Luque, organized a second expedition, consisting of two ships, which set sail for the South Sea. Having reached the port of Stada, in lat. about 9° N., and having really discovered Peru, P. returned to Panama, carrying with him, however, many beautiful and valuable ornaments of gold and silver, which he had obtained from the friendly and generous natives, as well as specimens of woollen cloths of silky texture and brilliant hue, and some llama or alpaca. Unable to find in Panama a sufficient number of volunteers for the invasion of the newly-discovered country, the indomitable adventurer returned to Spain in 1528, narrated the story of his discoveries

before Charles V. and his ministers, described the wealth of the territory, and showed, as proof, the gold ornaments and vessels, the manufactures, &c., which he had brought with him. The result of his representations was, that the right of the discovery and conquest of Peru was conceded to him, and honourable titles—among others, those of Governor and Captain-general of Peru—were conferred on him. On his side, he agreed to raise a certain number of followers, and to send to the crown of Spain a fifth of all the treasure he should obtain. Returning to Panama, he set sail for Peru for the third and last time, with a well-equipped but small force, the number being not more than 150 men, of whom 27 were cavalry. The chief events of the conquest of Peru are detailed at sufficient length in the article PERU, and also the articles ALMAGRO and ATAHUALPA. Within two years, the great conqueror made the centre of Peru his own; but he who had surmounted so many stupendous difficulties, who had broken through the lofty barriers of the Andes, and, with his group of followers, been a victor in so many fields, fell a victim to a palsy, June 26, 1541.

P. was a soldier of the most undaunted courage, inflexible constancy of purpose, and indomitable resource; yet his success in Peru appears to have been, more the result of chance than of calculation. The bold stroke was the seizure of the Inca Atahualpa (q. v.), when surrounded by thousands of his followers; but in doing so, he deserved credit neither for originality nor policy, because the idea was borrowed from Cortes, and the step itself was as rashly and desperate, that its success can be regarded only as luck. Although on many occasions he appears to have been guided by noble and generous impulses, he was eminently selfish, perfidious, and relentless. His conquest of Peru is a drama in every act of which there is bloodshed; but the drama is at least consistent to the end. P. lived a life of violence, and died a violent and bloody death.

PIZARRO, GONZALO, threw in his fortunes with those of his brother Francisco, on the occasion when that leader returned to Spain in 1528. He was, like the great conqueror, illegitimate. He became a soldier at an early age, distinguished himself, before he joined his brother's expedition, by his skill in martial exercises, and when he reached Peru, was esteemed the best lance in the Spanish troop. The territory of Quito was assigned to him by Francisco, and he was enjoined to undertake an exploring expedition to the east, where a land, reputed to be extremely rich in specie, was said to lie. At the head of 530 Spaniards and a great concourse of Indians, P. set out on his famous journey in the beginning of 1540. Marching east, they reached a country traversed by lofty branches of the Andes. Here the icy winds besetted the limbs of the adventurers as they rose to the higher plateaus, and rendered helpless by the cold, many of them sick and died. Descending the eastern slopes of the Andes, they reached the 'Land of Cinnamon,' but as they could not transport the trees across the mountains, their discovery was almost valueless. Hearing of a land abounding in gold at the distance of ten days' journey, the leader resolved to reach it. Pushing forward, the Spaniards entered great forests, where often they had to hew a passage with their axes. Their clothes were now torn to shreds, and their provisions had been long exhausted. They killed and ate the dogs they had brought with them, after which they lived on the herbs and dangerous roots of the forest. At length they struck the broad but desolate waters of the Napo, an important affluent of the Amazon. On the surface of this broad river,

no vessel floated, and it ran amid gloomy woods, the silence of which was undisturbed save by the sound of the rushing waters. Here P. caused a rude bark to be constructed for the transport of the baggage and of the weaker travellers. Francisco de Orellana was intrusted with the command of the vessel. P., hearing of a populous nation at the distance of a few days' journey, who dwelt near the confluence of the Napo with a larger river, sent forward Orellana to obtain and bring back supplies for the starving travellers, who had eaten the last of their horses, and were now reduced to the leather of their saddles and belts. Orellana reached the Amazon; but, unable either to obtain supplies, or to return against the current of the river, abandoned the expedition, and with his fifty followers resolved to sail down the Amazon, reach the Atlantic, and make for Spain. This wonderful design was successfully carried out. P., after waiting in vain for the return of the barque, resolved to return to Quito, which, after enduring terrible sufferings, and seeking fruitlessly for the rich regions of which he had heard so much, he reached in June 1542, after an absence of more than two years. The fatal character of this expedition may be inferred from the appearance the travellers presented on their return. Half of the 4000 Indians had perished, and of the Spaniards, only eighty remained; and these, clad in skins, blackened by the sun, and wasted by hunger and fatigue, with long matted locks, seemed like a troop of spectral savages. This expedition stands unmatched in the annals of American discovery for its dangers and sufferings, for the length of their duration, and for the heroic fortitude with which they were endured. For the fate of Gonzalo P., see article PERU.

PIZZICATO (Ital. twitched), abbreviated *pizz.*, a phrase used in Music for the violin or violoncello, to denote that the strings, instead of being played as usual by the bow, are to be twitched with the fingers in the manner of a harp or guitar. The pizzicato is much used in accompaniments, as sounds thus produced do not cover the voice; it is also used in symphonic effects. The ordinary mode of playing is restored by the letters *c. a.* (*col arco*, with the bow).

PLACENTA, or **AFTER-BIRTH**, a temporary organ that is developed within the uterus during pregnancy, and is, as its popular name implies, expelled from the maternal organism shortly after the birth of the child or young animal. It is a spongy vascular mass, existing in some form or other in all mammals, excepting the *Marsupialia* and *Monotremata*, as an appendage to the fetal membrane called the *chorion*. In the human subject (fig. 1), it is of considerable size at the period of delivery, being of a rounded or oval form, with a diameter of 6 or 8 inches, and a thickness of somewhat more than an inch. Its outer surface, which, till the period of its detachment and expulsion, is attached to the walls of the uterus, is uniform and level (unless it has been morbidly adherent), being covered by a membrane, shortly to be noticed, called the *decidua serotina*; and on peeling off this membrane, the various lobes of which the placenta is composed are apparent. The internal or free surface is smooth and shining, and gives attachment to the umbilical cord or navel-string, which connects it with the fetus. To render the mode of formation of the placenta clear, we must premise that the impregnated ovum, when it reaches the uterus, is invested with an outer membrane, the *chorion*, which forms a shut sac, externally covered with short villi. As the ovum advances in age, these villi diminish in number, until few remain,

except at that part of the chorion which is in contact with the uterus; and here, about the second month (in the human subject), they divide into branches, as shewn in fig. 2. While these changes are going on in the membrane of the ovum, the uterus is also undergoing modification; and it is on the nature and extent of these uterine changes that the character or type of the placenta depends.

Fig. 1.—Human Placenta (half of it being split in two) and Umbilical Cord.

There are two such types, the first of which is best represented by the human placenta, and the latter by that of the pig.

In animals exhibiting the first type of placental structure, the mucous membrane lining the uterus

Fig. 2.—Diagrammatic Section of a Human Pregnant Uterus, with the contained Ovum:

u, uterus; f, oviuct (or Fallopian tube); c, cervix uteri or neck of the womb; du, decidua uteri; dr, decidua serotina; ds, decidua serotina; ch, chorion; am, amnion; al, allantois; nb, umbilical vesicle; z, villi, which form the fetal part of the placenta; z', villi over the rest of the chorion, which, in the human subject, take no part in the placental function.

undergoes a rapid growth and modification of texture, becoming connected with the *membrana decidua*, which is so called from its being thrown off at each parturition. For brevity, it is usually termed the *decidua*. This decidua is from an early period separable into three portions—the *decidua*

even, or decidua vera, which lines the general cavity of the uterus; the decidua reflexa, which immediately invests the ovum; and the decidua serotina, which is merely a special development of a part of the decidua vera at the part where the villi of the chorion are becoming converted into the fetal portion of the placenta. The arrangement of these layers is distinctly seen in fig. 2. At first, the villi of the chorion lie loosely in the corresponding depressions of the decidua; but subsequently, the fetal and maternal structures (the villi and the decidua vera) become closely united, so as to form one inseparable mass, by the following means: the deepest villi of the chorion become imbricated in the spaces of the placenta; a network of vessels which enters a space not, in the case of the young, are formed vessels, slip down between the villi, 'not at last well united and between them, so that finally the villi are completely bound up or covered by the membrane which constitutes the walls of the space; in this membrane following the contour of all the villi, and with passing, to a certain extent, over the branches and stems of the tufts.'—Gould's *Anatomical and Pathological Observations*, p. 63.

The pure maternal blood is conveyed to the placenta by what are termed from their tortuous nature, 'the uterine arteries' of the uterus, and is returned by the large veins termed sinuses. 'The fetal vessels,' says Dr Carpenter, 'being bathed in this blood, as the branches of aquatic animals are in the water that surrounds them, not only enable the fetal blood to exchange its venous character for the arterial, by taking up its carbonic acid as the maternal blood, and reserving oxygen from it, but they also serve as excretors, by which certain nutritious elements of the maternal blood (probably those composing the liquor sanguinis) are taken into the system of the fetus.' It is probable, too, that the placenta is to be regarded as an excretory organ, serving for the removal, through the maternal blood, of excrementitious matter, whose continued circulation through the blood of the fetus would be prejudicial to the latter.—*Huxley's Physiology*, 3d ed., pp. 1012, 1014. Moreover, the recent investigations of Brown show that the placenta secretes, like the liver, the xanthine matter known as Glycogen (p. v.), which probably takes part in keeping up the animal heat. The vascular connection between the fetus and the placenta is effected by the umbilical vein (containing arterial blood) and the two umbilical arteries (containing venous blood), all of which lie in the umbilical cord which connects the Fetus (p. v.) with the placenta. The placenta may be formed at any point of the uterus, but is most commonly on the left side. Occasionally (in 11 cases out of 660, according to Naegle), it is situated partially or entirely over the mouth of the womb (see *sterc*), in which case dangerous flooding takes place previous to or at the period of labour. This condition is known as *placenta previa*, and under ordinary management, 'one in three of the mothers are lost, and more than 85 per cent. of the children.'—Churchill, *Theory and Practice of Midwifery*, 5d ed. p. 473. By substituting the detachment and extraction of the placenta for the old method of turning the child *in utero*, Professor Simpson finds that the mortality sinks to one in fourteen of the mothers, but slightly rises (to 69 per cent.) in the case of the children.

Another difficulty in midwifery practice, but far less serious than the preceding, is undue retention of the placenta. In ordinary cases, the average interval between the birth of the child and the separation of the after-birth is a quarter of an hour; but as this separation does not take place within an hour or at least two and a half, the case is regarded as

coming under the head of 'retained placenta.' It occurs in about 1 case in 400, and in these cases is fatal to about one mother in five; the cause of death being hæmorrhage. The principal causes of retention are either imperfect and inefficient, or irregular contraction of the womb, after the birth of the child. In the first of these cases if the uterus cannot be excited to sufficient action, the placenta must be withdrawn by steady traction at the umbilical cord, and if it is not, extraction by the introduction of the hand (an operation always to be avoided if possible) must be resorted to; in the latter case, manual extraction is constantly necessary. Sometimes, in consequence of indolence, or other affection of the placenta, there may be adhesion between its outer surface and the inner surface of the uterus. This is the most dangerous form of retention, there being usually extensive laceration, and additionally the risk arises from the decomposition of any portion that cannot be removed without undue violence.

The placenta acquires its proper character, in the human subject, during the third month, and it subsequently goes on increasing to the full period of gestation. At about the fourth month, the blood, moving through the enlarged chorionic vessels, produces a peculiar murmur, which is known as the *placental bruit*, resembling the sound made by blowing gently over the lip of a wide-mouthed phial, and increasing in intensity and strength as pregnancy (of which it is one of the characteristic signs) advances.

In animals exhibiting the second type of placental structure—as, for example, the pig—the placenta is comparatively simple in its structure. 'No decidua is developed; the elevations and depressions of the unimpregnated uterus simply acquire a greater size and vascularity during pregnancy, and adhere closely with the chorionic villi, which do not become restricted to one spot, but are developed from all parts of the chorion, except its poles, and remain persistent in the broad zone thus formed throughout fetal life. The cohesion of the fetal and maternal placenta, however, is overcome by slight maceration or post-mortem change; and at parturition, the fetal villi are simply drawn out like fingers from a glove, no vascular substance of the mother being thrown off.' Professor Huxley, from whose *Elements of Comparative Anatomy* (1864, p. 103) the preceding extract is borrowed, follows the opinion adopted by De Blainville, Von Baer, Eschricht, Milne-Edwards, Gervais, and Vogt in regarding 'the features of the placenta as affording the best characters which have yet been proposed for classifying the monodelphous (or placental) mammals.' He proposes to apply the term *deciduous* to those animals whose placenta presents the human type, and which throw off a decidua; and to term those animals *non-deciduous* in which the placenta is constructed on the same plan as that of the pig. 'Thus,' he observes, 'man; the ape, or so-called *Quadrumanus*; the *Insectivora*; the *Chiroptera*; the *Rodentia*, to which the lowest apes present as many remarkable approximations; and the *Carnivora*, are all as closely connected by their placental structure as they are by their general affinities. With the pig, on the other hand, the ungulate quadrupeds, and the Cetacea which have been studied, agree in developing no decidua, or, in other words, in the fact, that no vascular maternal parts are thrown off during parturition. But considerable differences are observed in the details of the disposition of the fetal villi, and of the parts of the spine which receive them. Thus, in the horse, camel, and Cetacea, the villi are scattered as in the pig, and the placenta is said to be diffuse; while

PLACENTA—PLACETUM REGIUM.

in almost all true *Ruminants*, the foetal villi are gathered into bundles or cotyledons (fig. 3), which in the sheep are convex, and are received into cups

be correct as to different orders of plants. It is certain that in many cases in which the placenta appear as axile, they are formed from the edges of the carpellary leaves which fold in to meet in the axis, and form *Dissepiments* (q. v.) between the cells of the germen. The number of placenta corresponds with the number of carpels in the germen, or appears to be the double of it, each carpel producing two rows of ovules instead of one. See figures in article **PISTIL**.

PLACENZA. See **PIACENZA**.

PLACETUM REGIUM, called also **PLACET**, **EXEQUATUR**, **LETTRES PATENTES**, is an act or instrument executed in virtue of the privilege claimed by the government in certain kingdoms to exercise a supervision over the communications of the Roman pontiff with the clergy and people of those kingdoms, and to suspend or prevent the publication of any brief, bull, or other papal instrument which may appear to contravene the laws of the kingdom, or to compromise the public interest. The early Christian emperors, it is well known, freely stretched their legislation into the affairs of the church; and one constant cause of conflict between church and state, in the medieval period, was the attempt, on the part of the sovereign, to control the free intercourse of the pope with the several churches. In the Pragmatic Sanction in France, and in the similar legislation of Spain, Portugal, Sicily, and the Low

Countries during the 15th c., the claims of the state on the same head are more than once asserted; and among the so-called 'liberties' of the later Gallican Church was a certain, though not a complete subjection to the state in this particular; but it was in the German states that this claim was most distinctly asserted, and most formally embodied in the constitutional law. The principle upon which the Peace of Westphalia, so far as regards its religious provisions, is based, is that the will of the sovereign of the state is supreme and final in all the concerns of religion. *Cujus regio illius et religio* ('Whose territory, his also the religion'), became the maxim of church government; and, of course, within certain limits, the Catholic sovereigns acted as freely upon it as the Protestant. This intermixture of the spiritual and the temporal prevailed especially in the mixed governments of the ecclesiastical sovereigns of Germany, the prince-bishops of the Rhine; but without the same foundation, the system was carried to its height in Austria under Joseph II. (see **FEBRONIANISM**, **PIUS VI.**), the excessive minuteness of whose ecclesiastical ordinances procured for him the sobriquet of 'The Sacristan.' Under him, all pontifical bulls, briefs, and constitutions, and all the ordinances of the local bishops, were made subject to the imperial censorship, and it was forbidden to publish any of them without its receiving the *placet* of the emperor. The only exception, in the case of pontifical decrees, regarded those emanating from the Roman Penitentiary (q. v.), which, as being of their nature secret, were not held subject to revision. In Prussia, the same law was enforced, as also in Baden and Saxony, no less than in the Protestant governments of Wurtemberg, Saxe-Gotha, Saxe-Weimar, &c. These claims of the state had always been the subject of protest on the part of the Roman see, but the church, nevertheless, had been compelled to acquiesce silently in the enforcement. In many cases, however, they have led to serious disputes, of which the mixed-marriage question in Prussia furnished a recent and very

Fig. 3.—Uterus of a Cow in the middle of Pregnancy, laid open :

v, vagina; u, uterus; ch, chorion; c', uterine cotyledons; c, foetal cotyledons.

of the mucous membrane of the uterus; while in the cow, on the contrary, they are concave, and fit upon corresponding convexities of the uterus.'

The remarks which have been made on the functions of the human placenta, are equally applicable to all placental mammals generally.

The *diseases* of the human placenta had not been studied with any accuracy, until the subject was taken up by Professor Simpson. This distinguished physician and subsequent observers have ascertained that the placenta is liable to (1) congestion, ending in the effusion of blood into the substance of the organ upon its surfaces, or between the membranes; (2) Inflammation, giving rise to adhesions, or terminating in suppuration, which may occasion very serious constitutional disturbances; (3) Partial or entire hypertrophy or atrophy; and (4), Fatty degeneration, affecting its small vessels. Whatever be the form of disease by which the placenta is attacked, the result is usually fatal to the foetus.

PLACENTA, in Botany, a membrane of the interior of the Germen (q. v.) or ovary, to which the ovules are attached either immediately or by Umbilical Cords (q. v.). The placenta sometimes appears as a mere thickening of the walls of the germen. In many cases, it is a more decided projection from the walls of the germen. When thus connected with the walls of the germen, the placenta are described as *parietal* (Lat. *paries*, a wall). But in some plants, the placenta of the different cells of the germen are united together in a column in its axis, and they are then described as *axile*. This distinction is of great importance as characterising different natural orders. Parietal placenta are formed where the edges of carpellary leaves unite; but great difficulty has been experienced by vegetable physiologists in explaining the formation of axile placenta; some regarding them as also originally formed in this manner, and others as formed in a quite different manner from the axis itself; nor is it impossible that both theories may

PLACOID FISHES—PLAGUE

remarkable example. On the whole, nevertheless, the results have involved less of conflict than might have been expected. The general relaxation of absolutist principles in the government, whether of state or of church, which followed the revolution of 1848, has led to very considerable modifications of these regulations in almost all the German states; and in Austria especially, the concordat has involved many important changes in every department of ecclesiastical institutions.

PLACOID FISHES, an order of fishes, in the classification proposed by Agassiz, characterized by having *piloid* (Gr. *plax*, a broad plate) scales, irregular plates of hard bone, not imbricated, but placed near together in the skin. These scales or plates are of considerable size in some fishes, but in others they are very small, tolering, as in the dogfish, of which the skin forms fine-grained

epidermally, characterized by hollow, or swellings of the lymphatic glands, by catarrhes and patches, and not apparently furnishing any security against its recurrence in the same individual. For a history of the origin of the plague in the far East (China), and its gradual spread, under the name of the *Black Death* (q. v.), through Asia and Europe, in the 14th c., the reader is referred to Hensler's *Epidemics of the Middle Ages* (1844), published by the Hygienic Society. Its true and permanent home seems to be in the regions bordering upon the eastern extremity of the Mediterranean. At different periods of the 16th, 16th, and 17th centuries, it visited Western Europe. It last attacked London and England about generally in the years 1603-1604, while so late as 1710, it destroyed nearly half the population of Marseille; and seventy years afterwards, prevalent in Russia and Poland, since which time it has been almost unknown in Western Europe. It is now limited solely to Egypt, Syria, Anatolia, Greece, and Turkey, occasionally extending northward towards Russia, and westward as far as Malta.

The disease usually commences with a swelling of the lymphatic glands, slight fever, nausea, pains, and stiffness, confusion of ideas, giddiness, and pain in the loins. These symptoms are rapidly followed by increased mental disturbances, with occasional stupor and delirium, by alternate pallor and flushing of the face, by catarrhs of the eyes, and a feeling of intense constriction in the region of the heart. During pains are felt in the groin, armpits and other parts of the body, which are soon followed by enlargements of the lymphatic glands, or buboes (which sometimes appear on the foot and second day, sometimes not till near the close of the disease), and sometimes are altogether absent, and by the formation of *carbuncles* on various parts of the body. As the disease advances, the tongue becomes dry and brown, while the gums, teeth, and lips are covered with a dark fur; the bowels, at first constipated, become relaxed, the stools being dark, offensive, and sometimes bloody. The power of the will on the muscles is much impaired; and altogether the patient resembles a person under the influence of intoxication. Throughout the disease, there is more or less tendency to faintness; and usually about the second or third day, petechial spots, livid patches like lesions and dark stripes (called *striae*), appear upon the skin, especially in severe cases. These discolorations are owing to the extravasation of blood, and are often accompanied with hæmorrhagic discharges from the mucous membranes. In fatal cases, the pulse gradually sinks, the surface becomes cold and clammy, blood issues from the nostrils, sometimes, there is coma, or low delirium, and death occurs usually in five or six days, either without a struggle, or preceded by convulsions.

Great differences of opinion exist as to the cause of plague. Some maintain that it is propagated exclusively by a peculiar contagion; others, while admitting its contagious nature, maintain that it may also be spontaneously suggested by endemic or epidemic influences; while others, again, reject the contagion view altogether, and assert that it originates exclusively in local causes or epidemic influences. Of these three views, the great mass of evidence goes to show that the second is the correct one. Whatever may be the cause of the disease, temperature appears to exert a considerable influence over it. In tropical climates, the disease is unknown, and the mild weather of northern climates has been observed to check its ravages. In Europe, it has always been most fatal in the summer and autumn, especially in September. Thus, in the

FIGURE 1.

Figure 1. Placoid scales of different species. (a) shows a cluster of scales from the bottom of the tail of a shark. (b) shows a single scale from the side of a shark. (c) shows a single scale from the side of a shark. (d) shows a single scale from the side of a shark.

sharp-pointed, dentate scales among the P. F. These cartilaginous fishes which have no scales. The order is exclusively composed of *Cartilaginous fishes* (q. v.). The existing P. F. are few in comparison with the fossil genera and species. Placoid scales are often elevated in the middle, the centre sometimes rising into a strongly projecting point or spine. They exhibit great variety of form, sometimes even in different parts of the same fish.

PLAGIAL, a musical term, principally applicable to *Circle Fives* and signifying collateral. Gregory the Great, in revising the labours of Ambrose, and recommending the *Plagalus* (q. v.) of the church, added to the scales of Ambrose, which he distinguished as authentic, certain other collateral scales, which he called *plagal*, possessing the peculiarity of having the octave so divided that the fourth was above the fifth. Melodists are now known as *plagal* which have their principal notes contained between the fifth of the key and its octave or twelfth. The *salience*, consisting of the subdominant harmony followed by the tonic, is called the *plagal salience*—

PLACIOTOMI (Gr. *transverse-nostil*), an order of fishes, in the system of Müller, containing the cartilaginous fishes with Placoid (q. v.) scales, and divided into two sub-orders, one containing *scorpioids*, and the other rays. The P. have five or seven gill-openings. They have no air-bladder. Fertilization takes place before the eggs are deposited, and the scales are furnished with *spines*.

PLAGUE, a very malignant kind of contagion, being prevailing at certain times and places

great plague of London in 1665, the deaths from the plague were, in June, 590; in July, 4129; in August, 20,046; in September, 26,230; in October, 14,373; in November, 3449; while in December, they were less than 1000.

The exact nature of the disease is unknown. A poison whose characters evade all chemical and microscopical examination, is absorbed, and alters at once, or after a short stage of incubation, the composition of the blood and the condition of the tissues.

With respect to treatment, little can be done to arrest the progress of the disease in any individual case. The patient should, if possible, be removed at once from the source of the disease; he should be exposed freely to fresh air; his secretions should be duly regulated, and his strength supported as far as possible. Friction with olive oil has been strongly recommended, but subsequent experience has not confirmed the first reports in its favour. But although treatment is comparatively valueless, much may be done towards guarding against the attacks of the disease. There can be little doubt that it is in consequence of the free external use of cold water, perfect cleanliness, moderate habits of life, and superior ventilation, that European (especially English) residents in the infected cities of the Levant are comparatively exempt from this disease. It is very possible that inunction of the body with olive oil may be (as has been asserted) a useful prophylactic agent, although it fails to cure the disease. It is almost needless to add, that all unnecessary communication with the sick, or contact with clothes or other matter that may have been infected with the poison, should be as much as possible avoided.

PLAICE (*Platessa vulgaris*), a species of Flounder (q. v.), much resembling the common flounder, but rather broader in proportion to its length; the upper surface of the body and the fins olive-brown, marked with large bright orange spots; a row of similar spots on the dorsal fin and on the anal fin; no tubercular asperities on any part of the body, but a curved row of bony tubercles on the eye-side of the head. The P. inhabits sandy and muddy banks, not in very deep water, and is very abundant on most parts of the British coasts, as well as on those of continental Europe. Like the common flounder, it often ascends slow rivers to some distance from the sea, and it has even been found to thrive well when transferred to fresh-water ponds. It feeds on worms, molluscs, small crustaceans, and young fishes. It has been known to attain the weight of fifteen pounds, but a P. of seven or eight pounds is accounted large. It is taken both by lines and trawl-nets. It is in considerable esteem for the table, although so plentiful in the British markets, that it is in general very cheap.

PLAID, a woollen garment, in the form of a large scarf, to wrap round the body, and used chiefly among the rural population of Scotland. See **TARTAN**.

PLAIN, in Geography, is an extensive tract of country which, on the whole, preserves a nearly uniform elevation. When referred to the level of the sea, plains may be distinguished into low plains or lowlands, and elevated plains called plateaux or *Table-lands* (q. v.). Plains differ much in appearance, according to the nature of their soil and climate, from the frightful sandy wastes of Africa, to the luxuriant fertility of the South American *silvas*. They are occasionally crossed by hills of moderate altitude, which, however, are generally detached, and exhibit no connection with

any neighbouring mountain system. These hills often, as in the North American plains, degenerate into mere undulations, perfectly uniform in structure. The term 'plains' is, in a limited sense, confined to the plains of Western Europe; those of other parts of the world receiving special designations, and differing from each other in many important points; thus, we have the *Steppes* (q. v.) of Eastern Europe and Asia; the *Deserts* (q. v.) of Arabia and Africa; the *Savannahs* (q. v.) and *Prairies* (q. v.) of North America; and the *Llanos* (q. v.), *Pampas* (q. v.), and *Silvas* (q. v.) of South America. The chief plains of Europe are, the country stretching from the foot of the Carpathians in Galicia to the Ural Mountains (including Poland and Russia), the drainage-area of the Danube in Hungary, and the portion of Europe which is bounded by the Elbe, the Harz Mountains, France, and the sea. Plains of comparatively small extent, but presenting the necessary characteristics in perfection, are found in almost all countries.

PLAINSONG, or **CANTO FERMO** (Ital.), a name given by the Church of Rome to the ecclesiastical chant. It is an extremely simple melody, admitting only notes of equal value, rarely extending beyond the compass of an octave, and never exceeding nine notes, the staff on which the notes are placed consisting of only four lines. The clefs are C and F. St Ambrose is considered to have been the inventor or systematiser of Plain-song. His labours consisted in selecting from the extremely complicated system of the Greeks a set of scales sufficiently few and simple for a very rude people. During the two centuries succeeding the death of Ambrose, his institutions fell into utter confusion. Gregory the Great revived and perfected them, recasting them into an *Antiphony*, or authorised body of ecclesiastical music, and brought Plain-song into the state in which it is yet used in the Roman church. See **AMBROSIAN CHANT** and **GREGORIAN CHANT**.

PLAIN-TIFF, in English and Irish Law, is the name given to the person who institutes and maintains a civil action or suit against another, who is called the Defendant. In Scotland, a plaintiff is called a Pursuer. But in both countries, many proceedings and applications of a civil nature are commenced by petition; and hence the party taking the initiative is called the Petitioner.

PLAN, a word frequently applied to all kinds of architectural drawings, but which ought to be limited to those which represent the horizontal sections of the various floors of buildings. Plans shew the disposition of the apartments and walls, with the situation of the fireplaces, cupboards, doors, &c.; they, in fact, represent the different stories as they actually appear as seen from above, when the walls are built two or three feet above the level of each floor.

PLANARIA, a genus of worms placed by Cuvier among *Entozoa*, although not parasites, but inhabitants of stagnant waters, because of their great resemblance to some of the entozoic parasites, and particularly to flukes. The species are numerous. Some inhabit fresh, and others salt water; they feed on small annelids, molluscs, &c. They are generally found creeping among confervæ, or on the stems of plants. Many of the larger marine species are able to swim freely by flappings of the broad margins of their bodies. The body of a planaria seems to be entirely gelatinous; but M. de Quatrefages has detected under the skin an arrangement of muscular fibres. Two red specks in the fore-part of the body of many species have been supposed to be eyes; but there is no proof of

II. *Plasmas* are hermaphrodites, but regulate for mutual impregnation. Their power of multiplication by division is very great: if an individual be cut to pieces, each piece continues to live and feed, and even if it be the end of the tail, as soon as the first moment of pain and irritation has passed, begins to move in the same direction as that in which the entire animal was advancing, as if the body was actuated throughout by the same impulse; and, moreover, every division, even if it is not more than the eighth or tenth part of the creature, will become complete and perfect in all its organs.—*Exquisite Jokes.*

PLANE, in Geometry, is a surface without curvature, and the test of it is, that any two points whatever being taken in the surface, the straight line which joins them lies wholly in the surface. When two planes cross or intersect one another, their common section is a straight line; and the inclination of the planes to each other is measured by taking any point in their common section, and drawing from it two straight lines, one in each plane, perpendicular to the common section; the angle contained by these lines is the angle of inclination of the planes. When the angle is a right angle, the planes are perpendicular to each other.

PLANE (*Platanus*), a genus of trees, the sole genus of the natural order *Platanaceæ*, regarded by many as a suborder of *Asteraceæ* (L.V.). The flowers are in globose stalked catkins; the ovary is unilocular, and contains one or two pendulous

Plane Tree (*Platanus orientalis*).

ovules. The species of *P.* are few; natives of temperate climates in the northern hemisphere; tall trees, with smooth whitish bark, which annually scales off in large pieces, and large palmate deciduous leaves. The catkins are small, and commonly placed one above another on the same stalk; they are pendulous, with long stalks, and give plane trees a very peculiar appearance, especially in winter, when they remain after the leaves have fallen.—The ORIENTAL *P.* (*P. orientalis*), a native of Greece and the East, was much admired and planted, both by the Greeks and the Romans, as an ornamental tree; no other tree, indeed, commanding equal admiration; and, for centuries, the youth of Greece assembled under the shade of planes in the groves of Academe and elsewhere, as we now do in philosophy. To this day, the *P.* is generally planted for shade and ornament in

the south of Europe. Many fine trees exist in England, but they were at one time much more numerous, great part having died in the end of last century, probably from some disease similar to the potato disease. The injury often done to the young leaves by late frosts, and the lengthening duration of the summer for the proper ripening of the wood, render the *P.* less suitable for husbandry; yet there is a tree at Carlton Castle 66 feet high. No tree better endures the atmosphere of a large city, and there are no finer trees within the precincts of London than the *P.* trees which are to be seen in some places there. In its native regions the *P.* attains an immense size. One tree, which grows in the meadow of Byzantium on the banks of the Bosphorus, is 141 feet in circumference at the base—the trunk being apparently formed of several which have grown together—extends its branches 45 feet from the trunk, and is believed to be more than 2000 years old. The wood of the *P.*, when young, is yellowish-white; when old, it is brownish, fine grained, takes a high polish, and is esteemed for cabinet-making. A rich alluvial soil and the vicinity of water are most suitable to the tree.—The NORTH AMERICAN *P.*, or BETTLEWOOD (*P. occidentalis*), is a very similar tree. It is the largest deciduous tree of the United States, and abounds on the banks of the great rivers of the middle states. Its timber is not very valuable, and is very liable to decay. It is sometimes called the *Water Tree*, from the weed which, as in the former species, covers the under side of the young leaves, and which, being cast off, floats about on the wind. A tree of this species on the bank of the Thames, in Chelsea Hospital gardens, is 115 feet high, with a trunk five feet in diameter.—The name *P.* tree is commonly given in Scotland to the *Myrica* (*Acer pseudo-platanus*), which resembles the true plane in its foliage.

PLANE, a tool used for rendering the surface of wood smooth and level. It consists of an oblong block of wood or metal (the latter is only just coming into use), with an opening through the centre; this opening is square on the upper side, and is always large enough to admit the cutting instrument; it diminishes down to a mere slit on the under side, merely wide enough to allow the cutting edge of the plane-iron and the shaving of wood which it cuts off to pass through. The form

Fig. 1.

of this opening will be seen at *a*, fig. 1, which represents the section of a common jack-plane. The essential part of the tool is the plane-iron, a piece of steel with a chisel-shaped edge, and a slot in its centre for a large headed screw to work and to attach to it a strengthening plate. Fig. 2 shows the plane-iron, and fig. 3 the same with the strengthening plate attached; these are shown in their proper position at *bd* in the section fig. 1, and they are held in place by the hand-screw wedges (fig. 4), seen also in the section at *c*. By driving in the wedges, the irons are held very firmly in their place, and they are so adjusted that only the fine

PLANETA—PEANETOIDS.

sharp chisel-edge of the cutting-tool projects through the slit in the bottom of the body of the plane, so that when the tool is pushed forward by the force of the hand, the cutting edge pares off all irregularities, until the wood is as smooth as the under

surface of the plane. There are many modifications in this tool, which can have its cutting edge and under surface made to almost any contour, so that mouldings of all kinds may be made. The two commonest are the jack-plane for rough work, and the smoothing-plane for finishing off plane surfaces.

PLANING-MACHINES have lately been much in use, by which both wood and metal are planed. In the case of those intended for wood, the cutting instruments are moved forward over the wood by machinery in the same manner as in the hand-plane. The precision and rapidity with which these machines work have given great facilities for building, as one machine will do as much work as sixty men. The planing-machines used for metal are different in principle. A well-tempered, chisel-edged steel cutter is held in a fixed position, pressing downwards upon the metal plate, which is moved forward by powerful machinery. The action of this movement is, that a groove is ploughed into the metal of the size of the steel cutter; when the metal has travelled its full length, and has made the groove complete, the downward pressure of the tool is removed, and by the action of the double screw which has carried it forward, it is returned, and readjusted for another groove to be formed by the side of the first; and this is repeated until the whole surface of the plate is reduced to the required level. However tedious this process may appear, it offers such facilities for metal working as were previously unknown.

PLANETA, the Greek name of the vestment called by the Latins Casula, and in English 'Chasuble,' which is worn by priests in the celebration of mass. The form of this vestment in the modern Roman church, differs both from the ancient form and from that in use in the Greek church. The change appears to date from the 9th c., but has been gradual. A certain modification of the Roman planeta was recently introduced in England under the inspiration of the late Mr Pugin, the great reviver of Gothic architecture and ecclesiastical costume and decoration. But its use has been only partial even in England.

PLANETARIUM, a machine much employed by astronomers in the 17th and 18th centuries, and first constructed by Huyghens and Römer, for the purpose of exhibiting clearly the motion of the heavenly bodies in conformity with the Copernican doctrine. The P. exhibited only the orbital motions of the planets about the sun, either in circles or ellipses, and with constant or varying motions, according to the perfection of the machine. It was subsequently supplemented by the combined tellurian and lunarian, which exhibited at one and the same time the motion of the moon about the earth and that of the latter round the sun, with the principal phenomena (such as the succession of day and night, the varying length of each, eclipses, and

the motion of the moon's apogee and nodes) which accompany these motions. A *satellite machine* was also invented to illustrate the motions of Jupiter's satellites. All these machines are now combined in the Orrery (q. v.), which exhibits in the best manner possible the varied motions and phenomena of the bodies in the solar system.

PLANETOIDS, or A'STEROIDS, the name given to that numerous group of very small planets which are situated in the solar system between Mars and Jupiter. Till the present century they remained undiscovered; but for some years before, their existence had been suspected, mainly owing to the remarkable hiatus in the series of the planetary distances when compared with the law of Bode (q. v.). On the first day of the present century the first of them was detected by Piazzi of Palermo, and his success roused his brother astronomers to search for more planets. Their search was successful, for Olbers (q. v.) discovered two in 1802 and 1807, and Harding one in 1804; but as all researches for some time subsequent to 1807 were unavailing, astronomers gradually allowed themselves to settle down into the belief that no more planetoids remained to be discovered, when the detection of a fifth by Hencke in 1845, revived the hope of fresh discoveries, and from this period no year (excepting 1846) has passed without adding to the list. The number at present (1864) known is 81. This remarkable success of the astronomers of our time is due to the systematic manner in which the zodiacal belt has been explored, and the place and apparent size of every star of this region distinctly determined; so that the presence of a wandering body can at once be detected.

The magnitudes of these celestial bodies have not been accurately ascertained, but it is certain that they are exceedingly small as compared even with Mercury, the least of the other planets; the diameter of the largest among them being generally believed not to exceed 450 miles, while most of the others are very much smaller than this. They also differ, generally speaking, from the rest of the planets in other respects; their orbits are of greater eccentricity, are inclined to the ecliptic at a greater angle, and are interlaced in a most intricate manner, crossing each other so frequently as to form, when viewed perpendicularly, a kind of network. The consequence of this is, that a planetoid which is nearest the sun at one part of its orbit, is, when at another part of its orbit, further from it than are several of the others, and a mutual eclipsing of the sun at different periods by two planetoids must be of very frequent occurrence. From the generally large size of their angle of inclination to the ecliptic, many of them occasionally travel far beyond the limits of the zodiac, and are thence termed *ultra-zodiacal planets*. Of the planetoids, Flora has the shortest period of revolution (1193 days), and consequently, by Kepler's third law, its mean distance from the sun is a little over 209 millions of miles; Maximiliana has the longest period (2343 days), and its mean distance from the sun is about 330 millions of miles. Concordia's orbit has least eccentricity, that element amounting to little more than $\frac{1}{4}$ of the major axis, while in Polyhymnia it amounts to more than $\frac{1}{2}$. Massalia's orbit makes a smaller angle—only $41^{\circ} 7'$ —with the ecliptic than that of any other planet in the solar system, while the inclination of the orbit of Pallas is no less than $34^{\circ} 42' 41''$. After the first two or three of these bodies had been discovered, the opinion was propounded by Olbers that they were but the fragments of some large planet; and this hypothesis received corroboration from the intimate connection which was shewn

PLANETOIDS—PLANETS.

to subsist among them; but of late years it has, to a considerable extent, fallen out of favour with astronomers.

The 81 planetoids, with the names of their discoverers, the dates of their discovery, and their periods of revolution, are as follows:

Name.	Date of Discovery.	Discoverer.	Period of Sidereal Revolution in Days.
1. Ceres,	1801, January 1, .	Piazzi, Palermo,	1671.
2. Pallas,	1802, March 28, .	Obers, Bremen,	1684.
3. Juno,	1804, September 1, .	Harding, Lilienthal (Bremen),	15.2.
4. Vesta,	1807, March 29, .	Obers, Bremen,	1325.
5. Astraea,	1845, December 8, .	Hencke, Driesen (Prussia),	1511.
6. Hebe,	1847, July 1, . . .	Hencke, Driesen (Prussia),	1380.
7. Iris,	1847, August 13, .	Hind, London,	1346.
8. Flora,	1847, October 18, .	Hind, London,	1193.
9. Metis,	1848, April 25, . .	Graham, Sligo,	1347.
10. Hygieia,	1849, April 12, . .	De Gasparis, Naples,	2043.
11. Parthenope,	1850, May 11, . . .	De Gasparis, Naples,	1402.
12. Victoria,	1850, September 13, .	Hind, London,	1301.
13. Egeria,	1850, November 2, .	De Gasparis, Naples,	1611.
14. Irene,	1851, May 19, . . .	Hind, London,	1513.
15. Eunomia,	1851, July 29, . . .	De Gasparis, Naples,	1070.
16. Psyche,	1852, March 17, . .	De Gasparis, Naples,	1826.
17. Thetis,	1852, April 17, . .	Luther, Bilk (Düsseldorf),	1420.
18. Melpomene,	1852, June 24, . . .	Hind, London,	1270.
19. Fortuna,	1852, August 22, . .	Hind, London,	13.3.
20. Massalia,	1852, September 19, .	De Gasparis, Naples,	1366.
21. Lutetia,	1852, November 15, .	Goldschmidt, Paris,	1353.
22. Calliope,	1852, November 16, .	Hind, London,	1612.
23. Thalia,	1852, December 15, .	Hind, London,	1.56.
24. Themis,	1853, April 5, . . .	De Gasparis, Naples,	2034.
25. Procyon,	1853, April 7, . . .	Chacornac, Marseille,	1359.
26. Proserpine,	1853, May 5,	Luther, Bilk,	1581.
27. Euterpe,	1853, November 8, .	Hind, London,	1314.
28. Bellona,	1854, March 1, . . .	Luther, Bilk,	1689.
29. Amphitrite,	1854, March 1, . . .	Murth, London,	1492.
30. Urania,	1854, July 22, . . .	Hind, London,	1.29.
31. Euphrosyne,	1854, September 1, .	Ferguson, Washington,	2048.
32. Penona,	1854, October 26, .	Goldschmidt, Paris,	15.0.
33. Polyhymnia,	1854, October 28, .	Chacornac, Paris,	1778.
34. Circe,	1855, April 6, . . .	Chacornac, Paris,	1609.
35. Leucothea,	1855, April 19, . . .	Luther, Bilk,	1908.
36. Atalanta,	1855, October 5, . .	Goldschmidt, Paris,	1666.
37. Fides,	1855, October 5, . .	Luther, Bilk,	1564.
38. Ieda,	1856, January 12, . .	Chacornac, Paris,	16.7.
39. Laetitia,	1856, February 8, . .	Chacornac, Paris,	1644.
40. Harmonia,	1856, March 31, . . .	Goldschmidt, Paris,	1247.
41. Daphne,	1856, May 22, . . .	Goldschmidt, Paris,	1779.
42. Iris,	1856, May 23, . . .	Pogson, Oxford,	1392.
43. Ariadne,	1857, April 15, . . .	Pogson, Oxford,	1195.
44. Nysa,	1857, May 27, . . .	Goldschmidt, Paris,	1379.
45. Eugenia,	1857, June 27, . . .	Goldschmidt, Paris,	16.0.
46. Hestia,	1857, August 16, . .	Pogson, Oxford,	1470.
47. Melite,	1857, September 9, .	Goldschmidt (Paris), & Schubert (St. Petersburg),	1529.
48. Aglaia,	1857, September 15, .	Luther, Bilk,	1783.
49. Doris,	1857, September 19, .	Goldschmidt, Paris,	1993.
50. Pales,	1857, September 19, .	Goldschmidt, Paris,	1980.
51. Virginia,	1857, October 4, . . .	Ferguson, Washington,	1577.
52. Nemausa,	1858, January 22, . .	Laurent, Nîmes (France),	1330.
53. Europa,	1858, February 6, . .	Goldschmidt, Paris,	1993.
54. Calypso,	1858, April 4, . . .	Luther, Bilk,	1543.
55. Alexandra,	1858, September 10, .	Goldschmidt, Paris,	1629.
56. Pandora,	1858, September 10, .	Searle, Albany, New York,	1674.
57. Mnemosyne,	1859, September 22, .	Luther, Bilk,	2049.
58. Concordia,	1860, March 24, . . .	Luther, Bilk,	1619.
59. Olympia,	1860, September 12, .	Chacornac, Paris,	16.3.
60. Echo,	1860, September 15, .	Ferguson, Washington,	1352.
61. Dunke,	1860, September 19, .	Goldschmidt, Paris,	1992.
62. Erato,	1860, September 14, .	Förster, Berlin,	2023.
63. Ausonia,	1861, February 10, . .	De Gasparis, Naples,	1556.
64. Angelina,	1861, March 4, . . .	Tempel, Marseille,	1601.
65. Maximiliana,	1861, March 8, . . .	Tempel, Marseille,	2143.
66. Maia,	1861, April 9, . . .	Tuttle, Cambridge, Massachusetts,	1558.
67. Asia,	1861, April 17, . . .	Pogson, Madras,	1374.
68. Heberia,	1861, April 29, . . .	Schiaparelli, Milan,	1893.
69. Leto,	1861, April 29, . . .	Luther, Bilk,	1638.
70. Panopea,	1861, May 5,	Goldschmidt, Chatillon (Paris),	1557.
71. Niobe,	1861, August 13, . . .	Luther, Bilk,	1671.
72. Feronia,	1862, February 12, . .	Peters (Clinton, N.Y.), & Safford (Washington),	1148.
73. Clytie,	1862, April 7, . . .	Tuttle, Cambridge, Massachusetts,	1590.
74. Galatea,	1862, August 29, . . .	Tempel, Marseille,	1590.
75. Eurydice,	1862, September 22, .	Peters, Clinton, New York,	1590.
76. Freya,	1862, October 21, . .	D'Arrest, Copenhagen,	2080.
77. Rigga,	1862, November 12, .	Peters, Clinton, New York,	1360.
78. Diana,	1863, March 15, . . .	Luther, Bilk,	Not determined.
79. Euryome,	1863, September 18, .	Watson, Ann Arbor, America,	Not determined.
80. Sappho,	1864, May 3,	Pogson, Madras,	Not determined.
81. Teleschore,	1864, September 30, .	Tempel, Marseille,	Not determined.

PLANETS (Gr. *planētes*, 'a wanderer'), are heavenly bodies (including the Earth) which revolve round our solar system, and revolve in elliptic

orbits round the sun. They are often denominated *primary planets*, to distinguish them from their moons or satellites, which are called *secondary*

sharp chisel-edge
the slit in the
that when the
of the head
larities, until

any place (not in a very high latitude) at mid-
night; they are always invisible at their superior
and inferior conjunctions, except when, at the latter
a Transit (q. v.) takes place. The superior conjunctions
are likewise invisible at conjunction, but when at
opposition they are seen with the greatest brilliancy,
being then due south at midnight. The time
which elapses from one conjunction to its corre-
sponding conjunction is called the *synodic period*
of a planet, and in the case of the inferior planets
must always be greater than the true period of
revolution.

Mercury, the planet which is nearest the sun, is
also, with the exception of the Planetes, the
smallest (being only 3 times the size of the
moon), and performs its revolution round the sun
in the shortest time. Its greatest elongation is
never more than $28^{\circ} 45'$, and consequently it is
never above the horizon more than two hours after
sunset, or the same time before sunrise. On this
account, and from its small apparent size (about
 $12''$), it is seldom distinctly observable to the
naked eye. It shines with a peculiarly vivid white
or rose-coloured light, and exhibits no satellites.

Venus, the next in order of distance and size to
us the most brilliant of all the planets, has an
orbit is more nearly a circle than any of the
others, and when at its inferior conjunction it
approaches nearer the Earth than any other planet.
Its apparent angular dimensions thence vary from
 $10''$ at the superior, to $70''$ at the inferior con-
junction. Its greatest elongation varies from 47°
 $47' 12''$, and therefore it can never be seen at
horizon for much more than three hours after
set, or the same time before sunrise. When seen
from the inferior to the superior conjunction it is
a *morning star*, and during the other half of its
synodic period an *evening star*. When the planet
is at an elongation of 40° , its brilliancy is
far surpassing that of the other planets, and
requiring a minute examination through the telescope
impossible. At this period it sometimes becomes
visible in the daytime, and after sunset is seen
as to throw a distinct shadow. Astronomers have
repeatedly attempted to ascertain the nature and
characteristics of its surface, but its brilliancy
dazzles the eyes as to render the correctness of the
observations at best doubtful. From the position
in the position of dusky patches on its surface,
which have been frequently noticed, it is concluded
that it revolves on its axis, and that its axis
is inclined to the plane of its orbit at an angle of
 75° , but many astronomers (Sir John Herschel
included) profess to doubt these conclusions. Venus
and Mercury necessarily exhibit phases like
the moon.—The *Earth*, the next planet in
will be found under its own name; it has a
satellite, the *Moon* (q. v.).—*Mars*, the
superior planets, is much inferior in size to
two previous, its volume being about one-third
the Earth's, and after Mercury, its orbit is more
more eccentric than those of the other planets.
The next planet to the Earth (i. e. in apparent
angular diameter is $30''$; but when at
conjunction, its diameter is less than that of
the moon.

 $10''$ at the superior, to $70''$ at the inferior con-
junction. Its greatest elongation varies from 47°
 $47' 12''$, and therefore it can never be seen at
horizon for much more than three hours after
set, or the same time before sunrise. When seen
from the inferior to the superior conjunction it is
a *morning star*, and during the other half of its
synodic period an *evening star*. When the planet
is at an elongation of 40° , its brilliancy is
far surpassing that of the other planets, and
requiring a minute examination through the telescope
impossible. At this period it sometimes becomes
visible in the daytime, and after sunset is seen
as to throw a distinct shadow. Astronomers have
repeatedly attempted to ascertain the nature and
characteristics of its surface, but its brilliancy
dazzles the eyes as to render the correctness of the
observations at best doubtful. From the position
in the position of dusky patches on its surface,
which have been frequently noticed, it is concluded
that it revolves on its axis, and that its axis
is inclined to the plane of its orbit at an angle of
 75° , but many astronomers (Sir John Herschel
included) profess to doubt these conclusions. Venus
and Mercury necessarily exhibit phases like
the moon.—The *Earth*, the next planet in
will be found under its own name; it has a
satellite, the *Moon* (q. v.).—*Mars*, the
superior planets, is much inferior in size to
two previous, its volume being about one-third
the Earth's, and after Mercury, its orbit is more
more eccentric than those of the other planets.
The next planet to the Earth (i. e. in apparent
angular diameter is $30''$; but when at
conjunction, its diameter is less than that of
the moon.

PLANETS—PLANT.

land; the green, water; while the white spots at the poles are with some reason supposed to be snow, since they decrease when most exposed to the sun, and increase under the contrary circumstances. The Phases (q. v.) of Mars range between full, half, full (in conjunction, if visible), and half.—After Mars in order come the *Planetoids* (q. v.), formerly but improperly called *Asteroids*.—*Jupiter*, the next in order, is the largest of all the planets, its bulk being more than 1400 times that of the Earth, though, from its small density, its mass is only 338 times more. After Venus it is the brightest of the planets and the largest in apparent size, its angular diameter varying from 30" to 45". When looked at through a telescope, it is seen to be considerably flattened at the poles, owing to its rapid revolution on its own axis; and its surface is crossed in a direction parallel to its equator by three or four distinct and strongly-marked belts, and a few others of a varying nature. Spots also appear and remain for some time on its surface, by means of which its revolution on its axis has been ascertained. This planet is attended by four satellites, which are easily observable through an ordinary telescope, and which have rendered immense service in the determination of longitudes at sea, and of the motion and velocity of light. The satellites, which were discovered by Galileo, were proved by Sir William Herschel to revolve on their own axes in the same time that they revolve round their primary. The smallest is about the same size as our Moon, the others are considerably larger.—*Saturn*, the next in position, is about 735 times larger in volume, though only about 100 times greater in mass than the earth. Its apparent diameter when in opposition is 18", and there is a considerable flattening towards the poles. Its surface is traversed by dusky belts much less distinctly marked than those of Jupiter, owing doubtless in great part to its inferior brightness; its general colour is a dull white or yellowish, but the shaded portions, when seen distinctly, are of a glaucous colour. The most remarkable peculiarity of Saturn is its ring, or series of concentric rings, each one parallel and in the same plane with the others, and with the planet's equator; the rings are at present supposed to be three in number, the two outermost are bright like the planet itself, while the innermost is of a purplish colour, and is only discernible through a powerful telescope. The rings are not always visible when Saturn is in the 'opposite' half of its orbit, for when the plane of the rings is intermediate between that of the earth's orbit and of the ecliptic, their dark surface is turned towards us, and when the sun is in their plane only the narrow edge is illuminated; in both of these cases the ring is invisible from the Earth. Its plane being inclined at an angle of 28° to the ecliptic, we see the two surfaces of the ring alternately for periods of 15 years at a time; and at the middle of each period, the rings attain their maximum obliquity to the ecliptic, and are then best seen from the Earth. It is hardly necessary to remark that at the end of each period they become invisible. Saturn has also no less than eight satellites, seven of which revolve round it in the same plane with the rings, and the eighth, which is the second in size, is inclined to it. Two of the satellites were discovered by Herschel in 1787 and 1789, four by Cassini in 1684, one by Huyghens in 1655, and one by England and Professor Bond in 1846. The satellites are all situated

outside of the ring, and the largest of them is nearly equal to the planet Mars in size.—*Uranus*, the next planet in position, was discovered accidentally by the elder Herschel on 13th March 1781, and was named 'the Georgium Sidus' and 'Herschel,' but these names soon fell into disuse. It is about 96 (some astronomers say 82) times greater than the Earth in volume, and 20 (according to others, 15) times in mass; but though so large, its distance is so much greater in proportion that astronomers have been unable to gain much information concerning it. No spots or belts have hitherto been discovered on its surface, and consequently its time of rotation and the position of its axis are unknown. It is attended by a number of satellites, but so minute do these bodies appear, that astronomers hitherto have been unable to agree as to their exact number; Sir William Herschel reckoned six, while other astronomers believe in the existence of four, five, and eight respectively. That there are at least four is without doubt.—The next and outermost member of the solar system is *Neptune*, which, at a distance of nearly 3000 millions of miles from the centre of the system, slowly performs its revolution round the sun, accomplishing the complete circuit in about 165 solar years. It is about 84 times larger than the Earth, but from its extreme remoteness is of almost inappreciable magnitude when seen through an ordinary telescope. It was the disturbance in the motion of Uranus caused by the attractive force of this planet which led Leverrier and Adams to a calculation of its size and position, on the supposition of its existence, and the directions which were given by the former to Dr Galle of Berlin, specifying its exact position in the heavens, led that astronomer to its discovery on 23d September 1846. Mr Lassell of Liverpool has discovered that Neptune is attended by one satellite. The satellites of Uranus and Neptune differ from the other planets, primary and secondary, in the direction of their motion, which is from east to west, and in the case of the former, in planes nearly perpendicular to the ecliptic. Both Uranus and Neptune were observed long before the times of Herschel and Leverrier, but they were always supposed to be stars. Uranus is known to have been observed by Flamsteed between 1690 and 1715, and Neptune by Lalande in 1795. For the periods, distances, size, density, &c., of the planets, see SOLAR SYSTEM. In astronomical tables, almanacs, &c., the planets are for convenience denoted by symbols instead of their names, as follows: Mercury, ☿; Venus, ♀; Earth, ⊕; Mars, ♂; the Planetoids, in the order of their discovery, ♁, ♂, ♆, &c.; Jupiter, ♃; Saturn, ♄ or ♅; Uranus, ♅; Neptune, ♆; the Sun, ☉; the Moon, ☾.

PLANT, a living organic being, destitute of any indication of mind or feeling, and sometimes defined as essentially differing from an animal in the want of voluntary motion. Plants are the organisms which form the *Vegetable Kingdom*. The science which treats of plants is called Botany (q. v.), of which there are several important branches.

The difference between plants and animals is sometimes difficult to discern, but only in some of the groups, which must of necessity be referred to the lowest place whether in the animal or vegetable kingdom. Plants of higher organisation can never be mistaken for animals, nor animals of higher organisation for plants. Instead of a regular ascending and descending scale of organisms, from the highest animal to the lowest plant, we find a widely-extended base from which the ascent seems to begin at once in both the organic kingdoms, with many ramifications in each; and perhaps that we do not at once recognise the difference even in the lowest

at his observation has

PLANETS.

planets. The name planet is of considerable antiquity, and was applied to these dependents of the sun to distinguish them from the myriads of luminous bodies which stud the sky, and which present to the naked eye no indication of change of place (see STARS). The planets at present known are, in the order of their distance from the sun, Mercury, Venus, the Earth, Mars, the Planetoids (q. v.), Jupiter, Saturn, Uranus, and Neptune. Six of these, Mercury, Venus, the Earth (which was not, however, then reckoned a planet), Mars, Jupiter, and Saturn, were known to the ancients; Uranus was discovered by Sir William Herschel (q. v.) in 1781; and Neptune, after having its position and elements determined theoretically by Leverrier and Adams, was discovered by M. Challis, and afterwards by Dr Galle, in 1846. The Planetoids, which now number 81, have all been discovered during the present century. Five of the planets, the Earth, Jupiter, Saturn, Uranus, and Neptune, are attended by one or more satellites; Uranus (generally), Neptune, almost the whole of the Planetoids, and all the satellites except the Moon, are invisible to the naked eye. The visible planets can be at once distinguished from the fixed stars by their clear steady light, while the latter have a sparkling or twinkling appearance. The comparative proximity of the planets may be proved by examining them through a telescope of moderate power, when they appear as round luminous disks, while the fixed stars exhibit no increase of magnitude. The planets, as observed from the Earth, move sometimes from west to east, sometimes from east to west, and for some time remain stationary at the point where progression ends and retrogression commences. This irregularity in their movements was very puzzling to the ancient astronomers, who invented various hypotheses to account for it. See PROLEMAIC SYSTEM and EPICYCLE. The system of Copernicus, by assuming the sun, and not the earth, as the centre of the system, explained with admirable simplicity what seemed before a maze of confusion.

The planetary orbits differ considerably in their degrees of excentricity, the Planetoids, Mars, and Mercury being most, and the larger planets least excentric. No two planets move exactly in the same plane, though, as a general rule, the planes of the larger planets most nearly coincide with that of the ecliptic. The latter are consequently always to be found within a small strip of the heavens extending on both sides of the ecliptic; while the others have a far wider range, Pallas, one of them, having the angular elevation of its orbit no less than $34^{\circ} 35'$ above the ecliptic. According to Kepler's Laws (q. v.), the nearer a planet is to the sun the shorter is the time of its revolution. The arrangement of the planets in the solar system bears no known relation to their relative size or weight, for though Mercury, Venus, and the Earth follow the same order in size and distance from the sun, yet Mars, which is further from the sun, is much less than either the Earth or Venus, and the Planetoids, which are still further off, are the least of all. Jupiter, which is next in order, is by far the largest, being about $1\frac{1}{4}$ times as large as all the others together; and as we proceed further onwards, the planets become smaller and smaller, Saturn being less than Jupiter, Uranus than Saturn, and Neptune than Uranus.

With reference to their distance from the sun, as compared with that of the Earth, the planets are divided into *superior* and *inferior*; Mercury and Venus are consequently the only 'inferior' planets, all the others being 'superior.' The inferior planets must always be on the same side of the Earth as the sun is, and can never be above the horizon of

any place (not in a very high latitude) at midnight; they are always invisible at their superior and inferior conjunctions, except when, at the latter, a *Transit* (q. v.) takes place. The superior planets are likewise invisible at conjunction, but when in opposition they are seen with the greatest distinctness, being then due south at midnight. The time which elapses from one conjunction to its corresponding conjunction is called the *synodic period* of a planet, and in the case of the inferior planets must always be greater than the true period of revolution.

Mercury, the planet which is nearest the sun, is also, with the exception of the Planetoids, the smallest (being only 3 times the size of the moon), and performs its revolution round the sun in the shortest time. Its greatest elongation is never more than $28^{\circ} 45'$, and consequently it is never above the horizon more than two hours after sunset, or the same time before sunrise; on this account, and from its small apparent size ($5''$ to $12''$), it is seldom distinctly observable by the naked eye. It shines with a peculiarly vivid white or rose-coloured light, and exhibits no spots.—*Venus*, the next in order of distance and period, is to us the most brilliant of all the planets. Its orbit is more nearly a circle than any of the others, and when at its inferior conjunction, it approaches nearer the Earth than any other planet. Its apparent angular dimensions thence vary from $10''$ at the superior, to $70''$ at the inferior conjunction. Its greatest elongation varies from 45° to $47^{\circ} 12'$, and therefore it can never be above the horizon for much more than three hours after sunset, or the same time before sunrise. While moving from the inferior to the superior conjunction, Venus is a *morning star*, and during the other half of its synodic period an *evening star*. When this planet is at an elongation of 40° , its brilliancy is greatest, far surpassing that of the other planets, and rendering a minute examination through the telescope impossible. At this period it sometimes becomes visible in the daytime, and after sunset is so bright as to throw a distinct shadow. Astronomers have repeatedly attempted to ascertain the nature and characteristics of its surface, but its brightness so dazzles the eyes as to render the correctness of their observations at best doubtful. From the changes in the position of dusky patches on its surface, which have been frequently noticed, it is concluded that it revolves on its axis, and that its equator is inclined to the plane of its orbit at an angle of 75° , but many astronomers (Sir John Herschel included) profess to doubt these conclusions. Both Venus and Mercury necessarily exhibit phases like the moon.—The *Earth*, the next planet in order, will be found under its own name; it has a single satellite, the *Moon* (q. v.).—*Mars*, the first of the superior planets, is much inferior in size to the two previous, its volume being about $\frac{1}{14}$ th of the Earth's, and, after Mercury, its orbit is much more excentric than those of the other planets. When it is nearest to the Earth (i. e., in opposition), its apparent angular diameter is $30''$; but when furthest from it (i. e., in conjunction), its diameter is not more than $4''$. Mars is less known than the rest of the superior planets, owing to its not possessing a satellite, by the motions of which its attractive force (and hence its mass and density) could be estimated. It shines with a fiery red light, and is a brilliant object in the heavens at midnight when near opposition; when seen through the telescope its surface appears to be covered with irregular blotches, some of them of a reddish, others of a greenish colour, while at each pole is a spot of dazzling white. The red spots are surmised to be

leaf; the green, water; while the white spots at the poles are with some reason supposed to be snow, since they decrease when most exposed to the sun, and increase under the contrary circumstances. The Phases of *Venus* range between full, half, full (or magnification), crescent, and half.—After *Mars*, in order come the *Planets* *in v.*, formerly but improperly called *Asteroids*.—*Jupiter*, the next in order, is the largest of all the planets, its bulk being more than 1400 times that of the Earth, though, from its small density, its mass is only 328 times more. After *Venus* it is the brightest of the planets and the largest in apparent size, its angular diameter varying from $35'$ to $45'$. When looked at through a telescope, it is seen to be considerably flattened at the poles, owing to its rapid revolution on its own axis; and its surface is marked by a direction parallel to the equator by three or four distinct and strongly-marked belts, and a few others of a varying nature. Spots also appear and remain for some time on its surface, by means of which its revolution on its axis has been ascertained. This planet is attended by four satellites, which are easily observable through an ordinary telescope, and which have rendered immense service in the determination of longitudes at sea, and of the motion and velocity of light. The satellites, which were discovered by Galileo, were proved by Sir William Herschel to revolve on their own axes in the same time that they revolve round their primary. The smallest is about the size and as our Moon, the others are considerably larger.—*Saturn*, the next in position, is about 785 times larger in volume, though only about 100 times greater in mass than the earth. Its apparent diameter when in opposition is $15''$, and there is a considerable flattening towards the poles. The surface is traversed by dusky belts much less distinctly marked than those of *Jupiter*, owing doubtless in great part to its inferior brightness; its general colour is a dull white or yellowish, but the distinct portions, when seen distinctly, are of a glassy or ash-colour. The most remarkable peculiarity in *Saturn* is its ring, or series of concentric rings, each ring parallel and in the same plane with the others, and with the planet's equator; the rings are at present supposed to be three in number; the two outermost are bright like the planet itself, while the innermost is of a greyish colour, and is only discernible through a powerful telescope. The rings are not always visible when *Saturn* is in the "opposite" half of its orbit, for when the plane of the rings is intermediate between that of the earth's orbit and of the ecliptic, those dark portions are turned towards us, and when the sun is in their plane only the narrow edge is observed; in both of these cases, the ring is invisible from the earth. Its plane being inclined at an angle of 28° to the ecliptic, we see the two surfaces of the ring alternately (or periods of 15 years at a time), and at the middle of each period, the rings assume their maximum obliquity to the ecliptic, and are then best seen from the earth. It is hardly necessary to remark that at the end of each period, they become invisible. *Saturn* has also no less than eight "satellites, seven of which revolve round it in planes little removed from the plane of the ring, while the eighth, which is the second in size, is considerably inclined to it. Two of the satellites were discovered by Herschel in 1787 and 1789, four by Cassini in 1672 and 1694, one by Huyghens in 1655, one by Mr. Lassell in England and Professor Hind in America in 1848. The satellites are all situated

outside of the ring, and the largest of them is nearly equal to the planet *Mars* in size.—*Uranus*, the next planet in position, was discovered accidentally by the officer Herschel on 13th March 1781, and was named "the Georgian Sidus" and "Herschel" but these names soon fell into disuse. It is about 36 times as numerous as 525 times greater than the Earth in volume, and 45 in moving as others, 160 times in mass; but though so large, its distance is so much greater in proportion that astronomers have been unable to gain much information concerning it. No spots or belts have hitherto been discovered on its surface, and consequently its time of rotation and the position of its axis are unknown. It is attended by a number of satellites, but as others for these bodies appear, that astronomers hitherto have been unable to agree as to their exact number; Sir William Herschel reckoned six, while other astronomers believe in the existence of two, five, and eight respectively. That there are at least four is without doubt.—The next and innermost member of the solar system, is *Neptune*, which, at a distance of nearly 2000 millions of miles from the centre of the system, shows no form in its revolution round the sun, encompassing the complete circuit in about 165 solar years. It is about 94 times larger than the Earth, but from the extreme remoteness it is almost inaccessible to the telescope when seen through an ordinary telescope. It was the disturbance in the motion of *Uranus* caused by the attractive force of this planet which led Leverrier and Adams to a calculation of its mass and position, or the supposition of its existence, and the directions which were given by the former to Dr. Halle of Berlin, specifying the exact position in the heavens, but that astronomer, on the discovery on 23d September 1846. Mr. Lassell of Liverpool has discovered that *Neptune* is attended by one satellite. The satellites of *Uranus* and *Neptune* differ from the other planets, primary and secondary, in the direction of their motion, which is from east to west, and in the case of the former, is planes nearly perpendicular to the ecliptic. Both *Uranus* and *Neptune* were observed long before the times of Herschel and Leverrier, but they were always supposed to be stars. *Uranus* is known to have been observed by Flamsteed between 1690 and 1750, and *Neptune* by Lalande in 1795. For the periods, distances, size, density, &c., of the planets, see *Solar System*. In astronomical tables, distances, &c., the planets are for convenience denoted by symbols instead of their names, as follows: Mercury, ☿; Venus, ♀; Earth, ⊕; Mars, ♂; the Planets, in the order of their discovery, ♃, ♄, ♅, ♆, &c.; Jupiter, ♃; Saturn, ♄ or ♅; Uranus, ♆; Neptune, ♇; the Sun, ☉; the Moon, ☾.

PLANT, a living organic being, destitute of any indication of mind or feeling, and sometimes defined as essentially differing from an animal in the want of voluntary motion. Plants are the organisms which form the *Vegetable Kingdom*. The science which treats of plants is called Botany (q. v.), of which there are several important branches.

The difference between plants and animals is sometimes difficult to discern, but only in some of the groups, which most of necessity is referred to the lowest plane whether in the animal or vegetable kingdom. Plants of higher organization can never be mistaken for animals, nor animals of higher organization for plants. Instead of a regular ascending and descending scale of organisms, from the highest animal to the lowest plant, we find a widely-extended base from which the ascent seems to begin at once, in both the organic kingdoms, with many ramifications in each, and perhaps that we do not at once recognize the difference even in the lowest

* The existence of a ninth satellite was suspected by M. Goldschmidt in April 1851, but his observation has not been verified.

PLANTAIN.

capsules with a lid. The *testa* of the seeds abounds in mucilage, which is easily extracted by boiling water. The order is allied to *Plumbaginæ* and *Primulaceæ*. There are about 120 known species, diffused over all parts of the globe, but most abundant in temperate and cold countries. The most important genus is *Plantago*, the species of which often receive the English name PLANTAIN. Five of this genus are found in the United Kingdom, the chief of which are the following: the GREATER PLANTAIN, or WAYBREAD (*P. major*), one of the most common of British plants; a perennial, with broad ovate stalked leaves and long cylindrical spikes, growing in pastures, waysides, &c. It is very widely diffused over the world. Its seeds are a favourite food of birds, and the gathering of the spikes to feed cage-birds is familiar to every one. The leaves are applied to wounds by the peasantry in many districts. They are said also to be a useful application to ulcers and indolent scrofulous tumours. — The RIBWORT PLANTAIN, or RIBGRASS (*P. lanceolata*), is another very common British plant, forming no small part of the herbage of many meadows and pastures, and sometimes sown by farmers, because its foliage is produced early in the season, and is then acceptable to oxen, sheep, and horses; but deemed most suitable for poor soils, as its spreading leaves occupy too much of the ground, and choke better grasses in rich land. Its leaves are lanceolate, and taper at both ends; its spikes are short, ovate or cylindrical, and placed on long angular stalks. Its seed is acceptable to cage-birds. This is the plant, commonly known as 'bullies,' or 'sodgers,' the striking off the heads (or spikes) of which is such a favourite amusement of children. — The mucilage of the seeds of *Plantago ispaghula* and of *P. psyllium* is much used in India in catarrhs and other complaints; and *P. psyllium*—called FLEAWORT, and its seeds FLEASEED—is cultivated in France for the sake of this mucilage, which is used by paper-stainers in preference to that obtained from linseed, and is also extensively used by muslin manufacturers for stiffening their goods. The plant has a branched spreading stem, and recurved leaves.

PLANTAIN (*Musa Paradisiaca*), a most important food-plant of tropical countries, and one of the largest of herbaceous plants, belongs to the natural order *Musaceæ* (q. v.), and is a native of the East Indies, where numberless varieties of it have been cultivated for thousands of years. It is now diffused over all the tropical and subtropical regions of the globe. It must have been carried to America soon after or during the days of Columbus, for its fruit was a principal article of food there in the first half of the 16th c.; but there is nothing to support the conjecture of Humboldt that there may be different species cultivated under the name of *P.*, and some of them natives of America. The *P.* is now, however, cultivated to the furthest depths of the primeval American forests, accompanies the Indians in their frequent changes of residence, forms the wealth of many occupiers of land in the vicinity of great towns, where large plantations of it are made, and is a true staff of life to the population of all colours and classes in tropical countries. In many regions it is the principal article of food.

In the genus *Musa* there arise from the midst of the leaves, or apparently from the top of the stem, the sheathing bases of the leaves forming a tree-like false stem stalks which bear great spikes of flowers, each enclosed in a large bract or spathe; the flowers, and afterwards the fruit, are arranged in clusters, or almost in whorls on the stalk; the flowers have a perianth of six segments, five of which cohere as a tube slit at the back, and the sixth is small and concave; there are six stamens,

one or more of them imperfect; the gynoecium is inferior, 3-celled, with two rows of ovules in each cell; the fruit is fleshy, and has many seeds imbedded in its pulp. The name *Musa* is from Arabic *muz*, a plantain; the *P.* seems to be derived by Pliny under the name *pala*, a name probably derived from an eastern root, from which also the name *plantain*. The specific name *Paradisiaca* alludes either to a fancy that the *P.* was the forbidden fruit of Eden, or to a legend that the aprons which our first parents made for themselves were of *P.* leaves.

The stem of the *P.* is usually 15 or 20 feet high, although there are varieties having a stem of six feet. The leaves are very large, the longest being sometimes ten feet long and three feet wide, undivided, of a beautiful shining green; the fruit is strong and fleshy. The fruit is oblong, varying in its usual long shape to an almost spherical, and obscurely angular, eight inches to a foot long; the varieties commonly known by the name *P.* are generally known by the name *Banana* (q. v.); the names, however, being somewhat variously used.

The *P.* is generally propagated by suckers, a sucker attains maturity in about eight months or a year after being planted. The stem dies down after fruiting, but the plantation does not require renewal for 15 or 20 years. The plants ought to be at least ten feet apart in plantations of them, or six feet in single rows around the gardens. The *P.* has been sometimes cultivated with success in hothouses.

With the exception of two or three plants, it would not be easy to name, in the whole vegetable kingdom, any plant which is applied to a greater number of uses than the plantain. The fruit is sometimes eaten raw, although more generally except that of the banana—boiled or roasted, variously prepared. It is both farinaeous and saccharine. In most of the varieties it has a sweet taste; in some it is mealy; and in some it is acid or austere. It is as much used before as perfectly ripe as when it is so. In the West Indies the *P.* boiled and beaten in a mortar is a common food of the negroes. Plantains baked in skins, or fried in slices with butter and pepper over with sugar, are favourite dishes in some tropical countries. They are preserved by drying in the sun or in ovens, and pressed into masses, which state they keep for years, and furnish a winter article of food. The unripe fruit, peeled, dried, and powdered, is called *P. meal*, in Guiana *Conquin-tay*; it is whitish with black specks, a fragrance like orris-root, and a taste like wheat-flour; and is made into excellent and nourishing dishes. A good and wholesome starch is obtained from the *P.* by rasping and washing. A decoction of the fruit is a common beverage; a kind of wine is obtained from it by fermenting. — The top of the stalk is a good boiled vegetable. The leaves are much used for packing and for other purposes; the fibre of their stalks is used for textile purposes and for cordage; and it is probable that it might be used for paper making. hitherto the leaves and stems of plantains have generally been burned or left to rot.

So great is the food produce of the *P.*, according to Humboldt's calculation, it is equal to that of the potato as 44 to 1, and to that of wheat as 133 to 1. The *P.* requires little attention.

The name *P.* is frequently extended to the genus *Musa*. Wild species, with austere taste,

substances are appropriated by plants, as food, and converted by a 'high and mysterious' alchymery into organic substances of many kinds, many of them suitable food for animals, which feed on organic substances alone. But the excrements of animals which furnish food for plants; and when animals die, their bodies undergo a series of changes by decomposition, which terminate in the production of the substances most suitable for the nourishment of plants. There is, moreover, not only this conversion of the same matter into animal and vegetable substances alternately, but there is also a continual interchange of matter which has remained inorganic throughout long geological periods into organic substances, and in the course of the lowest kinds of plants are particularly employed, as Indians, which decompose and feed upon the very rocks on which they grow; whilst, on the other hand, the fossil remains of minute periods and all the products of decomposition, which neither have once formed parts of living organisms, returned to an inorganic state.

PLANTAGENET, the surname of the French family of Anjou, which, in 1154, succeeded to the crown of England on the extinction of the Norman dynasty in the male line, and reigned till 1399, when it was supplanted by the family of York (p. 74). The name *P.* belonged originally to the House of Anjou, and is said by antiquaries to have been derived from the circumstance of the first count of that house having named himself to be married with branches of brown (plantagen) roses, as a pendant to the name which he had inherited. On the extinction of the male line of the Norman dynasty in the person of Henry I., the crown of England was claimed by Stephen, count of Blois, the son of Henry's sister Adela, or Adeliza, and by Henry's own daughter Matilda (the Empress Maud), the wife of Geoffrey B., Count of Anjou, for her son Henry Plantagenet. Stephen, by favour of the nobles, was the successful competitor, on the condition that Henry should succeed him, and accordingly on Stephen's death, in 1154, the son of Geoffrey P. ascended the throne of England as Henry II. His sons Richard I. and John succeeded him, and the descendants of the latter in the direct male line—viz., Henry III., Edward I., Edward II., Edward III., and Edward III.'s eldest son, the Black Prince, having died before his father, leaving an only son, who as Richard II., succeeded without intermission. The eldest male line now became extinct, and it was necessary to choose the rightful heir to the throne from among the descendants of Edward III.'s other sons.

His second son had died without heirs, but Edward, Duke of Clarence, John of Gaunt, Duke of Lancaster, and Edmund Langley, Duke of York, the third, fourth, and fifth sons respectively, were well represented by legitimate issue. Of these, Edmund Mortimer, Earl of March, and Anne Mortimer, the wife of Richard, Earl of Cambridge (who was the eldest son and heir of Edmund Langley, Duke of York), the blood descendants of Lionel of Clarence, possessed the prior claim to the throne; but Edward was put in prison by Henry IV., the eldest son of John of Gaunt, Duke of Lancaster, who married the crown in 1399, and transmitted it to his blood descendants Henry V. and Henry VI. By this time Edmund Mortimer had died with one issue, and the descendants of the marriage of his sister Anne (the heiress of Clarence) with Richard, Earl of Cambridge (the heir of York), possess the claims of the third and fifth sons; but, through their maternal ancestors, a superior claim to the throne over Henry VI. the Lancastrian monarch, was only represented the fourth
